AMERICAN SUPPLEMENT
TO
ENCYCLOPÆDIA BRITANNICA.

(NINTH EDITION.)

A DICTIONARY
OF
ARTS, SCIENCES, AND GENERAL LITERATURE.

ILLUSTRATED.

VOLUME IV.

PHILADELPHIA AND NEW YORK:
HUBBARD BROTHERS, PUBLISHERS.
1889.

58
1213100

Entered, according to Act of Congress, in the year 1889, by
HUBBARD BROTHERS,
In the Office of the Librarian of Congress, at Washington.

ENTERED AT STATIONERS' HALL.

VOL. IV.

PREFACE TO VOLUME IV.

WITH the present volume the American Supplement to the Ninth Edition of the *Encyclopædia Britannica* is brought to a close soon after the completion of the original work. This Supplement was commenced in 1882 at the earnest request of a large number of the American subscribers to the *Britannica*. A dozen volumes, forming one-half of that great work, had then appeared and its circulation in the United States was steadily increasing. Prof. Robert Ellis Thompson, Ph. D., was selected as editor-in-chief of the new undertaking and under his supervision the plan was drafted and the greater part of the first two volumes was prepared for the press. The original publishers having then relinquished the work Prof. Thompson retired and was succeeded by Rev. Howard Crosby, D. D., LL. D. Prof. John P. Lamberton, as associate editor, has had constant and direct charge of the work throughout its progress.

It had been announced that the Supplement should be comprised in four volumes of size similar to those of the *Britannica*. The First volume corresponds to Volumes I.-IV. of that work; the Second to Volumes V.-VIII.; the Third to Volumes IX.-XVII., and this concluding volume to Volumes XVIII.-XXIV. It is a fact manifest to all who have made the comparison that since this American work has been under way the successive volumes of the *Britannica* have given evidence of increasing attention to American subjects. Especially the several States and cities of this country have been more carefully described by American writers. Some of these, therefore, whose names fall within the limits of this volume, it has been deemed unnecessary to treat again.

The *Encyclopædia Britannica* has also furnished in its Twenty-third Volume a compact article on the "United States," in which American authorities of the first rank have discussed our country's history, geography, climate, vegetation, mineral resources, population, commerce, etc. This elaborate treatise seemed at once to render it superfluous to discuss this subject again in a similar way. The reader should remember, however, that numerous topics, there briefly considered within the compass of one article, have been treated more fully under appropriate titles throughout the Supplement.

The greater fulness of the *Encyclopædia Britannica* on American topics in its later volumes has enabled the editors of the Supplement to traverse the corresponding ground more rapidly. They have still found abundant room for judicious enlargement and addition to the original work. American biography, the careers and works of living persons of note at home and abroad, the political, legal, religious and social institutions of our country, its natural history and resources, are here exhibited at such length as their interest to Americans seemed to demand.

The important subjects relating to the Bible, which have been treated in the *Britannica* in an extremely rationalistic spirit (the later volumes in this regard exceeding the earlier), have been discussed in this Supplement in a reverent manner by American scholars of acknowledged ability. The views here presented, so far as they controvert the assertions of the English and German writers in the *Britannica*, will be found to be based on an equally thorough knowledge of the original languages and to show a more thorough sifting of evidence.

In concluding their labors in connection with this work the publishers and editors render their hearty thanks to the contributors who have diligently assisted them in their endeavor to amend, enlarge, perfect and adapt to American ideas the marvellous treasury of information to be found in the *Encyclopædia Britannica*. They trust that the American public which has shown a kind appreciation of the former volumes will receive this concluding volume with the same generous favor

LIST OF CONTRIBUTORS.

VOLUME IV.

This list embraces the names of those contributors whose names are signed (by their initials) to articles in the present volume.

Where two or more contributors have the same initials, a distinction has been made in printing them, which will enable the reader to assign to each his own work.

The writers whose names are marked with an asterisk (*) have exercised more or less editorial supervision in their respective departments.

HOWARD CROSBY, D. D., LL. D., *Editor-in-Chief.*

Prof. JOHN P. LAMBERTON, A. M., *Associate Editor.*

AMERICAN SUPPLEMENT TO ENCYCLOPÆDIA BRITANNICA.

NEAGLE—NEAT CATTLE.

NEAGLE, JOHN (1799–1865), painter, was born at Boston, Nov. 4, 1799. He was apprenticed to a coach-painter in Philadelphia, and about 1818 began to paint landscapes. In 1826 he painted Patrick Lyon the Blacksmith, and afterwards Gilbert Stuart, both of which are now in the Boston Athenæum. He married the daughter of the artist Thomas Sully, who gave him much encouragement and help. He lived for a time at New Orleans, but spent most of his life in Philadelphia. Among his notable portraits are Washington, Henry Clay, Henry C. Carey. He died at Philadelphia in 1865.

NEAL, DAVID, an American-German artist, was born at Lowell, Mass., in 1837. He went to Munich in 1861, and while studying there married the daughter of Chevalier Ainmuller. In 1869 he entered the studio of Piloty, and afterwards devoted himself entirely to figure-painting. Among his earlier works were *The Chapel of the Kings*, Westminster Abbey, and *The Interior of St. Mark's*, Venice. In 1876 his noted painting, *The First Meeting of Queen Mary Stuart and Rizzio*, obtained the grand medal of the Bavarian Academy. Among his other pictures are *The Return from the Chase*, James Watt, and several portraits.

NEAL, JOHN (1793–1876), author, was born at Portland, Maine, Aug. 25, 1793. After a varied experience of business life he studied law, but decided to obtain his living by his pen. In 1817 he published his first novel, *Keep Cool*, and about the same time was disowned by the Society of Friends, in which he had been brought up. He published a volume of poems, a tragedy, and wrote the *History of the American Revolution*, to which Paul Allen's name was prefixed. He prepared an index to the 50 volumes of *Niles' Register*, and wrote *Seventy-Six* and other novels. Going to England in 1824, he wrote for *Blackwood's Magazine* and other periodicals, and lived for a time with Bentham. Returning to America in 1827, he settled at Portland, and wrote diligently for the newspapers, practised law, and taught sparring and fencing. He gave up his profession in 1850, but continued to write. He died at Portland, Me., June 20, 1876. Among his works are *Brother Jonathan* (1825); *Rachel Dyer* (1828); *Bentham's Morals and Legislation* (1830); *Down-Easters* (1833); *True Womanhood* (1859), and finally his *Wandering Recollections of a Somewhat Busy Life* (1870).

NEAL, JOSEPH CLAY (1807–1847), humorist, was born at Greenland, N. H., Feb. 3, 1807. His father

had been principal of a school in Philadelphia, and after his death the family returned to that city. Joseph became connected with newspapers, and in 1831 was editor of the *Pennsylvanian*, which he conducted for several years, until his health failed. He went abroad in 1841, and in 1844 established *Neal's Saturday Gazette*. He died at Philadelphia, July 18, 1847. To his papers he had contributed sketches which were collected under the title, *Charcoal Sketches, or Scenes in a Metropolis* (1837). These were republished in London by Dickens. Neal also wrote *Peter Ploddy* (1844), and a new series of *Charcoal Sketches*.

NEAT CATTLE. What are called the "native cattle" of the United States are of no definite breed or strain, and are descended from animals coming from various parts of Europe. During the colonial period settlers coming from different parts of England naturally took with them the live-stock of their own districts. The British Islands, even from early times, had cattle of various types, although little pains were taken to keep the breeds distinct, or to rear stock having any special points of excellence. As a consequence the importations to this country were of varied character, and in many parts the stock assumed a mongrel type. The Dutch carried to New York their own excellent races of cattle; the French took theirs to Canada and Louisiana; cattle of Spanish breeds were imported to Texas, California, and Florida. There were also importations made later of large, yellow cattle from Denmark. Such and so various were the ancestors of the horned cattle of North America.

But the methods and conditions of early American agriculture had their effects on the live-stock kept in the colonies. In New England the cattle were remarkable for hardiness and for activity under the yoke, and not a few cows possessed excellent milking qualities. In this part of the country oxen are still largely employed for labor on farms. Throughout the lumbering districts, both in the North-west and in the South, oxen are much employed in drawing logs from the forests, being serviceable in rough and roadless places where the less patient horse cannot be employed to advantage. For like reasons oxen are also esteemed for work in stone-quarries, and generally in mountainous districts. In the Southern States many of the poorer class of farmers employ steers, or even cows, for draught purposes, often fastening a single animal by a rude harness to the shafts of a little cart. Elsewhere oxen are com-

monly worked in pairs, being yoked together by the neck. The head-yoke, so commonly used on the continent of Europe, is sometimes seen in this country, and its general use has found some earnest advocates among intelligent agricultural writers.

Hardly anywhere in the United States have there been stocks of cattle produced worthy of distinction as new breeds. An exception might be made in favor of the Texans and of a race of small cattle reared in the swampy regions of Florida. These diminutive Florida animals have latterly acquired a good reputation as generous producers of milk, and in the Southern States there has been awakened a considerable demand for them, not as true dairy animals, but rather as suppliers of milk for family use in villages and suburban places, much as Kerry cows are kept in the British Islands. It is not a little remarkable that in some marshy districts of the Gulf States the cattle have adopted some of the habits of the oriental buffalo, often submerging themselves in water to escape the heat of the sun and the attacks of insects, and plunging the head under water while browsing on aquatic and floating plants. In eating this kind of food the cattle devour also great numbers of insect larvæ and of other small water-animals of low type.

What are called Texan and Cherokee cattle are descendants of early Spanish importations. They are extensively bred in the South-west, where they live in a more than half wild state, cared for by mounted herders and cowboys, and knowing nothing of shelter nor, as a rule, of artificial feeding. A very large proportion of the stock on Western cattle-ranches is of this Texan race, wholly or in part. The reasons why they are still reared are these: they are very hardy, they are very cheap, and they already have the field. Intrinsically, the Texan steer is of little worth. The cows have very little of the milking quality. The form is lean and lank, the bones prominent, the horns of enormous size, the beef is of inferior quality, the fat very scanty. Yet many thousands of these cattle are marketed all over the country. The best are sometimes selected for corn-feeding, and are then partially fattened before being taken to the shambles. Many thousands of these bulls and cows come to us from Mexico, being driven across the line as "breeding animals," and thus escaping duty at the custom-house. The chief value of the Texan cows is as the mothers of grade Short-horn or Hereford heeves. The first cross with a blooded bull will produce steers and cows which, when three years old, will be worth double what a Texan animal of the same age is worth, besides being much more tractable in disposition. Half-blooded Texans, when well cared for, are often handsome animals.

The business of cattle-ranching has become a great feature of American enterprise. Vast fortunes have been made in it with small original capital, and the occupation has in itself many points of attraction for young men of adventurous and enterprising spirit. The life of ranchmen and cowboys is marked, indeed, with much of hardship and excitement, and some of its heroes have already found their way into dime novel literature and the weekly story-papers. But as hitherto conducted, there is as much or more to repel as to attract a sober-minded business man. The risk of losing stock from winter storms and scanty pasture is very great. Wealthy and unscrupulous ranchmen well understand the art of ruining the prospects of young and inexperienced aspirants. More than all, the field, or the best of it, is already well occupied, and the business is taking on new features. Many capitalists now have their own cattle-ranges instead of feeding their stock on the public lands. The fencing-in of such ranges interferes with the old practice of shifting the feeding ground with the change of seasons; and many breeders who have irrigable or arable lands find it to their advantage to grow winter forage for their stock.

The personnel of the cattle-ranges presents many

points of interest. Not a few cattle-men are college-bred gentlemen, with a taste for literature and society, but naturally, many frontiersmen of almost savage habits, and men from the Eastern States and from Europe with no character and doubtful record, have drifted into the business, the latter chiefly taking subordinate places.

The cattle-ranching business in the United States is carried on in all the unsettled districts between the Mississippi River and the Pacific, from the "Bad Lands" of the Upper Missouri southward to the Gulf of Mexico. Indeed, the "Bad Lands" have some good points for the cattle-men, for in their "draws," or ravines, the stock are sheltered from the winter storms, and in many spots good pasturage is to be found. Even the elevated mountain valleys and the desolate wastes of Arizona and Nevada are, to a great extent, covered with cattle-ranges. Such an unpromising native plant as the "white sage" (*Eurotia lanata*, called "winter-fat" in some places) is highly esteemed for its property of keeping the cattle fat in winter.

Among the improved breeds seen in the United States, the first place in point of popularity and in the money value of stock must undoubtedly be given to the Short-horns. The eastern and north-eastern counties of England were the original home of this race, which appears to have an alliance with the Dutch and Holstein breeds. As early as 1785 cattle of this stock were taken to what is now West Virginia, a State which to this day breeds many excellent beef-cattle, and others about the same time were sent into the State of New York. The first Short-horns were taken to Kentucky in 1800. Col. Lewis Sanders, of Kentucky, in 1817 made further importations. Col. John Hare Powel, of Philadelphia, was another early Short-horn importer of note. From year to year many high-priced animals of the best Short-horn families have been introduced into this country, until now the best American Short-horn stock is fully equal to any in the world, and some of our best animals have been sent to Great Britain for breeding purposes. The Short-horns are hardy in habit, of good constitution, and are of high excellence as beef-producers. The cows often prove good milkers. But this race is chiefly valued in this country for grading up unimproved herds of native stock. For this purpose no bulls but those of pure Short-horn race should be employed. The half-breed grade Short-horns are often animals of great beauty and excellence, but the males should not be used for breeding purposes. Short-horns make strong and willing oxen, but are considered too slow for general farm-use. For this purpose the more active *North Devons* are much preferred. This race of beautiful and gentle animals is of English origin. Many of them have been from time to time imported into this country, and there are many districts to which they are well adapted. The cows are fair milkers, the milk is rich, and the beef is excellent, though the steers are not so early fit for the butcher's use as are those of the Short-horn blood. The *Hereford* breed has many excellent qualities. It is a good beef-producing family, but the cows are seldom of much use in the dairy, and many breeders consider that the steers are less hardy and require more skill than Short-horns need in order to be bred to a profit. The *Ayrshires* are a handsome Scottish race with strong Short-horn alliances. They are splendid and copious milkers, and are justly valued by dairymen. Their milk is less rich in butter than that of the Channel Island cows, but they are more profitable when the milk is sold in the cities, and their milk is inferior to none for use in the cheese-factory. There are "butter families" and "cheese families" among cattle of this breed. The *Jersey* and *Guernsey* breeds are the two principal stocks of Channel Island cattle, for the true *Alderneys* are scarcely known to the general breeder. These relatively small and very beautiful animals are greatly prized for the richness of their

milk and the excellence of their butter. They are often kept for family use, and many American butter-producers keep them in considerable herds. Their peculiar excellence is often transmitted to their grade offspring, which frequently excel their mothers in the quantity of their milk. The bulls of this race are often singularly fierce and treacherous. For the shambles, the Channel Island cattle have little to recommend them. Many *Dutch*, *North Holland*, and *Holstein* cattle are now bred in this country. Practically, they may be considered as all of one breed. They produce enormous quantities of milk and are every year increasing in favor with dairymen. They are of large size, and when past the age of service make good beef. For producing butchers' steers, it is believed that this breed and its grades will not rank far below the Short-horns. The *hornless Scotch* breeds (the Aberdeen, polled Angus, and Galloway) are very thrifty and hardy animals, producing a good flow of rich milk. They afford excellent beef steers, and are of late attracting much attention in this country. The nations of Continental Europe have a great many well-marked breeds of cattle. Several of these are worthy of trial in this country. A few breeders have turned their attention to Swiss cows, of which there are several pretty distinct stocks. Some strains of Swiss cows have proved extremely profitable as milk-producers, while for hardiness and activity they are not surpassed. These latter qualities ought to fit them well for ranch life. On the plains an active, independent animal that can shift for itself, and does not fear wolves or wild dogs, and has the courage to graze far away from water-holes, is highly valued, and is set down as "a good rustler," the highest title of commendation that a beast or a man can receive on the plains.

The subject of *transportation* of cattle has received great attention in this country, and the trunk-lines of railway have invested large sums of money in cattle-cars and the other appliances needed in the business. Near most of the large cities of the country extensive *stock-yards* have been established for the reception and marketing of cattle. Much capital has been employed in the shipment of live-stock to European markets, but the recent invention of cheap systems of refrigeration, by means of which dressed beef can be shipped in perfect condition from New Zealand or Australia to London, has interfered with American shipments of living cattle and made capitalists very cautious in their ventures in such enterprises.

For an account of the cattle-ranch business in its palmiest days see Gen. J. S. Brisbin's *The Beef Bonanza* (1880). The U. S. Census Report of Mr. Clarence Gordon on *Meat Production* (1880, published in 1883) is a very elaborate and careful one, but its statistics have already gone out of date, so rapidly has the business been developed since that report was made. (See MEATS.) (C. W. G.)

NEBRASKA. Since 1883 the following changes have been made in the counties of this State. Sioux county has been divided into three, the most western retaining the original name; the middle is Dawes county, with county-seat at Chadron; the eastern is Sheridan, with county-seat at Rushville. Keya Paha county has been formed from that part of Brown north of the Niobrara river, and has Springview as its county-seat. From the part formerly unorganized have been formed the counties of Blaine, with county-seat at Brewster, and Logan, with county-seat at Gandy.

There still remain 112 townships unorganized.

The population of the State is estimated, in 1888, at 750,000. At the State election in November, 1886, the total vote was 138,239. There are many unnatur-

alized foreigners domiciled here. The total area is about 52,000,000 acres. Much still belongs to the public domain, and is subject to entry under the U. S. land laws at the government land offices at Beatrice, Lincoln, Niobrara, Grand Island, North Platte, and Neligh. Investigation is being carried on in regard to entries in the western half of the State, and final action on these is deferred until their character is proved.

Of the 12,370,497 acres of land granted by Congress to the Union Pacific Railroad, and of the 2,315,864 acres to the Burlington and Missouri Railroad, to which the State also gave an additional 50,000 acres, much remains as yet unsold within the State, and can be had at reasonable prices and on easy terms; while the State still owns 2,786,527 acres, subject to sale at not less than \$7 per acre, or to lease for terms of 20 years, at an annual rental of 6 per cent. on an average valuation of \$2.50 per acre, with the privilege to purchase at any time for not less than \$7 per acre, and subject to forfeiture of rents paid and improvements made on the land if the terms of the lease are not strictly complied with.

The total valuation of taxable property within the State as assessed for 1886-87 was \$133,418,699, of which \$18,534,789 was represented by 2,765 miles of railway, and the remainder by real estate and personal property in the hands of private owners. But for such property there is no standard of value fixed by law, and the biennial assessments for tax levies are no index whatever to its market value, which depends wholly upon the caprice or necessity of the private owner, the supply of and demand for money, and is purely a matter of speculation.

Within a few years Omaha was transformed from a provincial town of muddy streets and rickety frame buildings into a beautiful city of magnificent dimensions, with miles upon miles of excellent pavement lined on each side with grand structures of brick, iron, and stone in the latest styles of noble architecture, heated by steam and lighted by electricity and provided with all modern improvements.

Nebraska has been struggling with the problem of taxation and of just equalization of land values. As yet taxes on real estate are much lighter there than in other States; her tax laws do not essentially differ from those of other Western States. The Legislature in 1887 commenced the work of revenue and land tenure reform in good earnest. A law was passed looking toward the abolition of alien ownership of land, the limitation of private land ownership in general to actual use and occupation, and the raising of revenue by taxation of products rather than of the means of production.

The act of May 30, 1854, creating the Territory of Nebraska, abrogated the Missouri Compromise, making the line of 36° 30' N. lat. a boundary to the extension of African slavery on this continent, and while it was declared to be the true intent and meaning of that act "not to legislate slavery into any Territory or State, nor to exclude it therefrom, but to leave the people thereof perfectly free to form and regulate their domestic institutions in their own way," etc., the real design of the promoters of that act was to open all the western country to the introduction of negro slavery wherever profitable. The long and bloody struggle that ensued ought to be a warning to both sides in the present conflict between capital and labor over the means of existence. Otherwise Nebraska has profited by the experience of her elder sisters, and has shown greater wisdom in the prudent management of her munificent endowments by the national government for educational purposes and public buildings.

The new State capitol at Lincoln, in process of construction, is to be completed in December, 1889, at a cost of \$439,187, according to the contract made in 1883, and when completed it will be of more imposing appearance and better adapted to its uses than other more costly buildings of the kind.

The new *Insane Asylum*, at Norfolk, is a substantial brick building with a stone basement, 244 feet by 75. It has four stories, the top of its main tower being 120 feet high. It was erected at a total cost of \$65,772, but has not been opened as yet for the reception of patients.

The *State Reform School* for juvenile offenders, located on a farm of 320 acres, near the city of Kearney, in Buffalo county, has been enlarged by the addition of two new family buildings and a workshop at a cost of \$25,600. Instruction and labor under thorough discipline, which is that of the family, the school, the workshop, and the farm, rather than that of the prison, are the means employed for the reformation of those committed to its charge. Lately, instruction in military tactics has been introduced there with good results. The library contains 520 volumes of well-selected books. Besides an abundance of wholesome food for the inmates, the farm last year yielded a surplus for sale amounting to \$800. The total number of youths committed to the care of this institution from its opening in 1883 until 1886 was 208, of which 166 were boys and 42 girls.

The *State Penitentiary*, at Nobesville, is a solid stone structure, containing three tiers of eighty cells each, to which another tier of cells is to be added. Wooden buildings in the prison yard are used for workshops. The prison library contains over 3000 volumes of choice literature. The total number of prisoners received since its foundation in 1869 is 1146, of which 328 remained in prison at the beginning of the present year. Of these 307 were white, 16 colored, and 5 Indians.

The *Nebraska Institute for the Blind* is located at Nebraska City, and has now entered upon the twelfth year of its existence. During that time 73 blind children have received instruction, and 9 have completed the prescribed course. The enrolment in 1886 was 38.

A *Home for the Friendless* has been erected at Lincoln, costing \$10,000, but is not yet open.

An *Asylum for Feeble-Minded Children and Adults*, costing \$45,444, has been established near the city of Beatrice. It is a substantial two-story brick building with stone basement, 141 feet long by 91 feet wide, provided with all modern improvements, and will afford comfortable quarters for all of the 614 idiotic and imbecile persons thus far discovered within the State.

The *Institute for the Deaf and Dumb*, at Omaha, has been much improved. There are now 144 pupils at this institution, of which 83 are males and 61 females, from 7 to 22 years old.

The *Hospital for the Insane*, at Lincoln, has been renovated and enlarged, and the grounds around the buildings have been greatly beautified by the laying out of drives, walks, grass-plats, and flower-beds, and many other improvements have been made about the premises; 747 patients have been received there for treatment in 1886-87, and the present enrolment is 374, of which 227 are males and 147 females. A carefully selected library of some 450 volumes has been added to the hospital.

The *State University and Agricultural College*, at Lincoln, has been repaired and remodelled, and a new building of fine proportions has been erected at a cost of \$23,700 for the use of the industrial and scientific department. A complete equipment made to order in Europe has been procured for the Chemical Laboratory; 3000 volumes have been added to the general library; 325 to the Botanical Library; 1497 specimens to the Botanical Cabinet; 15,000 specimens to the Herbarium; and 1792 specimens to the Geological Cabinet. The fine arts school acquired a valuable collection of casts from the French exhibit at New Orleans. The total number of students is now 343, of which 31 attend the college of medicine, 135 the industrial and scientific school, 126 the Latin school, and 74 the school of fine arts.

The *State Normal School*, at Peru, has been enlarged by the addition of a substantial brick structure 94 by

56 feet, two stories high and a basement, and many other improvements have been made at a total cost of \$20,000. Its library now contains about 5000 volumes. Attendance increased from 274 students in 1881 to 478 in 1887.

The appropriations for the current expenses of these State institutions for the years 1887 and 1888 amount in the aggregate to \$2,722,897.

The Common Schools of the State are most liberally provided for. The total expenditures for these schools during the years 1885-86, including \$244,081 on hand at the close of 1886, amounted to \$6,357,624. The permanent common school fund, arising from a munificent endowment in lands yielding a large sum annually, had increased to \$4,904,119 at the close of the year 1886, and it is estimated that this fund will reach full \$20,000,000 when the lands are all sold. In the 4400 school districts of the State there are now enumerated 252,006 school children of both sexes, of which 180,059 are enrolled with an average attendance of 107,945 in 4369 school-houses, valued at \$3,821,317, and provided with \$122,675.33 worth of books and apparatus. During 1886 teachers' institutes were held in 66 counties, lasting on an average 11 days each, with an average daily attendance of 4225 teachers out of 5359 enrolments, at a total cost of \$11,947. The average monthly wages of male teachers is \$42.68, and of female teachers, \$34.70.

In 1843 districts lists of uniform text-books have been adopted which the pupils are required to purchase; 422 districts select their own text-books and furnish them free of cost to the children, while the remainder of the districts have as yet adopted no settled policy in this respect. The uniform experience in the districts which have adopted the free text-book system is, that it saves time and money, that school attendance is increased, that children of poor parents are kept at school longer, that the cost of books has been reduced one-third, and that of other supplies about one-half, and that in no case have contagious diseases been communicated thereby. "Arbor Day" (April 22) is generally observed in all the schools as a holiday, devoted to the planting of trees, with appropriate ceremonies and discourses on memorable persons and events. Besides these public schools there are a number of colleges and private schools devoted to higher education. Prominent among these are Creighton College, a Catholic institution at Omaha, for young men alone, and Brownell Hall, an Episcopal Seminary for young ladies alone, also at Omaha; the Methodist Episcopal College of Nebraska at York; the Nebraska Central College, another Methodist institution, at Central City; Gates College, established by the Columbus Association of Congregational Ministers and Churches, at Neligh; and Doane College at the beautiful town of Crete, another Congregational institution and the oldest of the kind in the State, having been founded in 1872; Merrill Hall was added in 1879, Boswell Observatory in 1883, and Ladies' Hall in 1884. These are for both sexes. Omaha and other towns of the State are also justly proud of their Public High Schools, where the eight years' course of common school studies is supplemented by a four years' course of instruction in the higher branches.

The growth of churches of all denominations has been co-equal with the general progress of the State, and many fine edifices have been and are being erected in every city and throughout the country generally.

Railroads.—The total number of miles operated within the State by the various railroad companies in 1886 was 3051 miles, of which 1633 miles were composed of steel rails and the rest of iron rails. The capital stock of these roads is estimated by the Railway Commissioners at \$66,292,832, or an average of \$21,722 per mile, and their aggregate debt at \$83,122,813. Their gross earnings for the year ending June 30, 1886, were \$15,720,747.95, an increase of \$1,571,429.25 over the previous year. The total amount of taxes paid by

the various lines was \$647,210, being over 8 per cent. on their net earnings within the State.

The total number of persons directly employed in the operation of the roads was 12,190, who earned \$6,745,454, or an average of \$582 each, during the year.

The main trunk lines traversing the length and breadth of the State are competing with each other for new territory, and pushing out branch lines in every direction, so that the total mileage of railroads will soon be greatly augmented.

The building of railroads and telegraph lines, the turning of the sod, and the planting of groves has had a marked ameliorating influence on the climate of the State, increasing the moisture and modifying the conditions of the atmosphere.

The observing traveller on a second summer's journey through the State, after an interval of a few years, cannot fail to be impressed with the changed appearance of the country, and notice that verdure and showers of blessings follow the star of empire in its westward course.

There is a marked difference in the water of streams heading on the Divide running east and west through the State about 25 miles south of its northern boundary. The waters flowing southward into the Platte River are all strongly alkaline, while those flowing northward into the Niobrara River are all soft-water streams from springs gushing out of the hillsides all along the northern side of the Divide, until the gypsum country of the Black Hills is reached. This northern part of the State gradually rises from an altitude of 1000 feet at the Missouri River to 3500 feet at the western boundary, giving a very good mean altitude for health and freedom from miasmatic troubles.

Agriculture and stock-raising are the chief industries of the State. The staple products of the farm are corn, wheat, oats, rye, barley, flax, broom-corn, sorghum, millet, all the common garden vegetables and the products of the dairy, the total value of which, produced during 1887, is estimated at \$60,000,000. The abundance of summer and winter pasture and the great corn product has made Nebraska one of the best meat-producing States of the West, and there is no other interest more prominent to-day than that of cattle-raising and fattening for market, as well as growing young stock for breeding purposes, in which business a vast amount of capital is profitably invested. Horticulture too has progressed far enough in the eastern part of the State to sustain a number of fruit-canning establishments.

The wholesale trade of the State is concentrated at Omaha, and carried on by about 200 firms.

For further detailed information see the biennial reports of the several State officers, the maps and descriptive pamphlets issued by the various railroad companies, and *The Industries of Omaha*. (F. H.)

NEEDLES. The needle is by no means a modern invention, but has been in use from pre-historic times, probably before the era of woven fabrics. These early needles were clumsy implements, made of wood, bone, or bronze, and even of gold, though these materials have long since been superseded by steel. Steel needles seem to have been introduced into Europe by the Moors, though it is not probable that they were the first inventors, since the Chinese claim to have used them from time immemorial. The first knowledge we have of the manufacture of needles in England is by a so-called "Indian," probably a Moor, who established this art in London in 1545, but it died out with him. The art of needle-making was then practiced in France and Germany, whence it had come from Spain, the home of the Moorish artificers. It was revived in England in the reign of Elizabeth, and by 1650 there was a numerous body of needle-makers established in London. They formed one of the London trade companies, having for their first crest the

tree of knowledge of good and evil, with a serpent twined round it. Afterwards a wreathed Moor's head was adopted.

At that period and until long afterwards the needles were made with square eyes, but this style of needle is now extinct. They were scoured by being wrapped in buckram, with emery-dust and oil, and rolled back and forth under the feet of the workmen. In 1700 a horse-mill was established for scouring and pointing, water-power not being used for this purpose till later. In the early period the needle-makers drew their own wire, cut it to length, flattened the eye end and punched the hole, a square punch being used as the easiest form. In 1793 drilled-eye needles were made, but these proved too expensive, and the old method was resumed. In 1800 stamps and dies to pierce the eyes of needles came into use, and in 1826 the drill was successfully applied, but it left the edge of the hole so sharp as to cut the thread. This was overcome by the burnishing process, which came into use about 1838. The needles were threaded in rows on hard steel wire, on which they were made to revolve rapidly by steam-power.

Up to 1840 needles had been hardened in water, which made many of them crooked. This was obviated by hardening in oil, which then came into use. The needle-pointing machine is an English invention. The pointing is done by a grooved grindstone, which is made to revolve at great speed, the needles being fed to it from an inclined plane. By the use of a revolving disc the wires are fed continuously and made to turn while pointing.

It is an interesting fact that round-eyed needles were made and used in China long before even the square-eyed ones were in use in Europe. In England the centre of the needle trade is the small town of Red-ditch—for no particular reason except that needles happened to be first made there. Aix-la-Chapelle in Prussia is the centre of the continental trade. Needles are now made in a great variety of shapes and applied to many different purposes, and the trade has become a very extensive and important one. The manufacture, as now carried on, is a remarkable instance of the division of labor, each needle having to pass through seventy pairs of hands before completion. The needle manufacture in America is not a particularly important one. It is classed in the census reports with the pin industry, there being in 1880 forty establishments for the manufacture of pins and needles, with a total product valued at \$1,378,023. (C. M.)

NEFF, FÉLIX (1798-1829), a Swiss missionary, was born at Geneva, Oct. 8, 1798. In early life he was a soldier, but in 1819 he engaged in missionary labors in neglected valleys of the higher Alps. He extended his work into similar districts in France, where he greatly improved the religious, moral, and physical condition of the inhabitants. In order to carry out his plan more effectually he obtained ordination in England in 1823 as an Independent minister. He died at Geneva, April 12, 1829, at the early age of thirty, worn out by his toil and hardships.

NEGLIGENCE. In American as in English law it is generally for the jury to say whether there has been negligence on the part of the defendant or not; there must, however, be evidence upon which intelligent men could reasonably and properly find the fact of negligence, or the court will withdraw the case from the jury and dismiss the complaint. The burden of proof is upon the plaintiff, and when he has raised a presumption of negligence he is entitled to recover unless the defendant produces evidence sufficient to rebut that presumption.

The strict English rule in regard to contributory negligence has recently been modified in the courts of that country. There it was formerly held that a passenger in train of A. Company, though having no control over the driver, was so far identified with him

See Vol. XVII.
p. 313 (p. 322
Am. Rep.).

See Vol. XVII.
p. 315 (p. 324
Am. Rep.).

that he could not recover against B. Company for an injury caused by an accident to which the negligence of A. Company's driver contributed. This rule has been followed by the courts of Pennsylvania and one or two other States only, but has recently been repudiated in England.

The rule that negligence of a parent or guardian in permitting an infant to become exposed to danger is to be imputed to the infant so as to bar its right of action for injury resulting therefrom has been followed in New York, Massachusetts, Illinois, Indiana, Nebraska, and California, but repudiated in Pennsylvania, Vermont, Ohio, and Alabama.

A master is liable for the negligent acts of his servants in the course of their employment. He is not responsible for any such act with respect to matters unconnected with the general business in which they serve him.

The general rule in England, as well as in America, has been that a master is not liable to a servant for injuries received by reason of the negligence of a fellow-servant. In the case of one servant being put in command of others the English courts, as well as those of some of the United States, have held that the master was not liable for injury to a fellow-servant resulting from his negligence. In the U. S. courts and the great majority of the State courts the contrary rule has been followed. (T. R.)

NEGRO. For anthropological treatment of this race the reader is referred to the *ENCYCLOPEDIA BRITANNICA*. The present article is confined to the "Negro Race in America: its history, present condition, and future prospects."

In the year 1565 Don Pedro de Menendez, the founder of a Spanish colony at St. Augustine, Florida, introduced the first African slaves into territory subsequently included in the United States of America. But prior to this Sir John Hawkins, in October, 1562, organized the first expedition of English-speaking people to engage in the African slave-trade. Associated with him in this ignoble enterprise were Sir Lionel Duckett, Sir Thomas Lodge, M. Gunston, his father-in-law, Sir William Winter, M. Bronfield, and about 100 men as well able to fight as to perform the functions of sailors. The expedition went forward in three vessels: the *Salomon*, 120 tons burthen; the *Swallow*, 100 tons; the *Jonas*, a bark of forty tons. Hawkins landed his expedition at Tagarin, on the coast of Guinea, and by sword and torch secured 300 African captives, whom he subsequently bartered in Hispaniola at the ports of Isabella, Porto de Plata, and Monte Christo. In exchange for his living chattels he received from the Spaniards sugar, ginger, hides, pearls, etc.

Hawkins performed two other voyages as an importer of slaves, voyages characterized by great cruelties to the African villages he set upon and burned, and many of whose inhabitants he slew with the sword or bore away into captivity. His second slave-voyage was begun on the 18th day of October, 1564, and the expedition was composed of the same vessels with the exception of the *Jonas*, whose place was filled by the *Jesus*, of Lubeck, 700 tons burthen. The third voyage was begun on Oct. 2, 1567, and, after many hardships and perils, ended Jan. 25, 1568. All the slaves secured by the three slave-hunting voyages of Sir John Hawkins were stealthily disposed of in the northern ports of the Spanish-American colonies, because the Spanish government, jealous of the increasing fame and power of the English upon the seas, had issued orders to its colonial governors to exclude all British ships from their ports. Notwithstanding official opposition Hawkins found the Spaniards eager to purchase his stolen Africans; and thus did an Englishman open up the slave-trade between Africa and America.

In August, 1619, a Dutch man-of-war fell in with an

English vessel, the *Treasurer*, Captain Elfred, in the West Indies, and, having recaptured from her twenty slaves previously taken from a Spanish vessel, sold them to planters in the colony of Virginia. The *Treasurer* was owned by the Earl of Warwick and Gov. Samuel Argall, and had been sent out by the earl with an old commission from the Duke of Savoy authorizing her to seize Spaniards as lawful prize. The twenty negroes were a part of 100 Africans whom the *Treasurer* found in a Spanish vessel. The Dutch man-of-war was not engaged in the slave-trade, but, being short of provisions, exchanged the recaptured Africans for food. The Dutch introduced slaves into Manhattan (New York) in 1625; and the first lot landed in the Eastern colonies was brought to Massachusetts in the ship *Desire*, Capt. Peirce, Feb. 26, 1637-38.

In 1631 an African Company was chartered for thirty-one years to trade on the coast of Guinea between Cape Blanco and the Cape of Good Hope; and all other persons and traders were strictly prohibited from trespassing upon the exclusive rights of the patentees. The English colonies in the West Indies and America were now to be supplied with African slaves; and in order to facilitate its business of stealing Africans the company erected forts and factories on the coast of Guinea at great expense.

In 1662 Charles II. granted letters of incorporation for an African Company with exclusive rights; and it undertook to supply the British West Indies with 3000 African slaves annually. The king's brother, the Duke of York, and other gentlemen of quality, became enthusiastic members of the company. In 1672 the company surrendered its charter to the crown, when the "Royal African Company" was incorporated upon a joint stock. This company included among its members the king, the Duke of York, and other persons of rank and quality. Its capital stock was £111,000 sterling, and the grant embraced the territory between Port Sallee, in South Barbary, to the Cape of Good Hope. It did a thriving business for a while; but by the "Declaration of Right" in 1688, with other royal companies, it was compelled to surrender its charter. However, in the following year it entered into a contract to supply the Spanish West Indies with slaves from Jamaica. By the close of the seventeenth century Brazil and the West Indies had been well stocked with African slaves, and the British colonies in America were exchanging rum and fish for slaves in the Spanish-American colonies or importing them direct from the west coast of Africa.

Convinced as to the value of African slaves in its North American colonies, the British government began to take official notice of the slave-trade and inaugurated the eighteenth century by encouraging the traffic in human flesh. In 1702 "her most gracious majesty," Queen Anne, in a letter of instructions to her colonial governors, directed that her subjects "take especial care that God Almighty be devoutly and duly served," and that the "Royal African Company of England" "take especial care that the said province may have a constant and a sufficient supply of merchantable negroes at moderate rates." Having opened up the slave-trade in North America the English now proposed to levy a tax upon all slaves imported into British colonies. On April 18, 1707, the Board of Trade, in a circular letter to the English-American colonies, urged that a light tax upon slaves was the best means for "the well supplying of the plantations and the colonies with a sufficient number of negroes at reasonable prices." The board maintained that the chief point to be considered was that it was "absolutely necessary that a trade so beneficial to the kingdom should be carried on to the greatest advantage."

Stimulated by the British government and by the rivalry of the Portuguese, Spanish, French, and Dutch adventurers, the slave-trade grew to enormous proportions. Between the years 1679 and

1689 the annual importation was about 4500; and between 1698 and 1707 about 25,000 slaves were landed annually. But notwithstanding the large number of interloping vessels of all nations engaged in the slave-trade, England was the only power that clothed the action of its seamen with the majesty of national authority. Her slave-ships increased until she could undertake to steal Africans for other nations. The service that France had once performed for Spain England now undertook. In 1713 Queen Anne, of England, entered into a contract with King Philip V. of Spain, to import 144,000 negroes into Spanish America within the space of thirty years, and she advanced to Philip 200,000 crowns for the franchise, and agreed to pay a duty of 33½ crowns upon each slave. The agreement was known as "The Assiento," and was as follows: "Her Britannic Majesty did offer and undertake, by persons whom she shall appoint, to bring into the West Indies of America belonging to his Catholic Majesty, in the space of thirty years, 144,000 negroes, at the rate of 4800 in each of the said thirty years." The Assiento was considered of such great importance that it became the subject of stipulation in the preliminaries of the treaty of peace at Utrecht; and it was solemnly confirmed as the sixteenth article of that treaty. This enterprise, which constituted the Queen of England and the King of Spain the largest slave-traders in the world, seemed to promise great financial gain. Philip took one-quarter of the stock and gave his note for it; Anne reserved to herself one-quarter, and the remaining one-half she left for her loyal subjects. For twenty years the annual importation of slaves was about 15,000, divided between the Spanish and English colonies; and for the last twenty years there were imported in English ships 20,000 slaves per annum. The number of slaves imported continued to increase until just before the passage of the "Non-importation Act," when it had reached 41,000 per annum for the British-American colonies, and 97,000 carried to the Spanish-American colonies. Between 1680 and 1700 the African Company and private traders exported about 300,000 slaves from Africa; and from 1700 to 1786 from Africa to Jamaica alone 610,000.

The total number imported into the West Indies and British colonies from 1680 to 1786 may be carefully stated at 2,130,000, an annual average of 20,095. The loss at sea was about one-eighth of the entire 2,130,000 slaves imported. The fleet that was engaged in the slave-trade was without a parallel in the history of the world. In 1771 there were 192 slave-ships sailing from London, Liverpool, and Bristol, with a capacity for carrying 47,000 slaves. There were 107 ships from Liverpool alone, with a capacity for 29,250 slaves. From 1771 to 1776 the average annual slave-fleet was 150 vessels sailing from English ports alone, in addition to those vessels employed by the subjects of other nations and by the British colonists in America. For the half century of the slave-trade to America, from 1700 to 1750, the estimated loss of life upon the ocean was 250,000 Africans, who were cast into the deep. The loss upon the land from hunger, disease, overwork, and cruel treatment was about one-sixteenth of the entire number landed, which was, in the English West Indies, American colonies, Spanish and French possessions, about 3,000,000 souls.

The rapid increase of slaves in the British-American colonies led to the enactment of special laws regulating the new system of labor in vogue. The laws varied in the different colonies. In the Southern colonies, where many whites had sold their service for a specified period, the law of bondage recognized two classes, "servants for a term of years, and servants for life;" while in Massachusetts and other Eastern colonies slavery was established by statute. In those colonies where there was no statute legalizing slavery it existed in contemplation of law; and many laws were enacted

recognizing negro slaves as real, personal, and mixed property. Slaves were bought and sold at private and public sales; were disposed of by will, and, sometimes, manumitted under certain declaratory and restraining statutes. The slave codes of the colonies were quite similar. The slaves were excluded from the ecclesiastical, civil, and militia establishments. They were not competent to testify in any criminal or judicial proceeding, unless all the parties to the cause were negroes. In some colonies the master's power over the slave extended to life and limb; in others the correction was restricted to moderate corporal punishment. As a class the colonial slaves were governed rigorously: being overworked, underfed, thinly clad, and wretchedly housed. When old and infirm they were usually manumitted, and then sent forth to earn their own living. This was practiced to such an alarming extent that some of the colonial Legislatures required that masters emancipating old slaves should furnish a bond that they should not become a charge upon the community. The slaves were not allowed to receive instruction of any kind in schools or from private individuals. In rare instances they were received into the communion of the Christian church; but the custom was to abandon them to the most degrading and destroying ignorance. Their marriages were by common consent without the presence or official sanction of a clergyman. Their immorality was due to the system under which they were constrained to languish. In sickness they were without nursing, and rarely secured the service of a physician, and when they died they were thrown into the common ditch. The free negroes and mulattoes were taxed, without representation. They were admitted to the church, but were without a voice in ecclesiastical government. They were compelled to train with the militia of the parish in which they resided, and yet they were assigned to fatigue duty alone. They could not stand for any civil office; could not cast a ballot for any candidate for office. They were denied social intercourse with the whites, and were forbidden to consort with slaves. They were constrained to furnish their own instruction, since there was no provision made by the colonies for the education of their children. The opportunities for young men to secure remunerative positions were rare; and thus the free negroes of the colonies were confined to servile employments.

Notwithstanding the painfully obscure position the free negroes and mulattoes of the colonies occupied, many of them attained to a high degree of intelligence and virtue, and some of them accumulated considerable property. During the colonial period there were some able representatives of these people. Phillis Wheatley (1753-1794), the poetess; Paul Cuffee [q. v.] (1759-1817), navigator, merchant, and philanthropist; Prima Hall (1756-1789), soldier, politician, and grand-master of the first lodge of negro masons; Benjamin Banneker (1731-1806), astronomer, philosopher, and author; James Durham (1762-1804), physician and chemist; Richard Fuller (1749-1829), mathematician, and others, were persons whose talents have attracted attention. They were not indifferent to the hardships under which their less fortunate brethren suffered, and their talents and character pleaded eloquently the cause of the oppressed.

Although slavery existed in all the British-American colonies, there was at all times more or less opposition to the system. A few years prior to the war of the revolution the agitation of the slavery question began to take definite shape. Letters of protest appeared in the colonial newspapers; the town meetings passed resolutions condemnatory of slavery, and instructed the representatives to the general courts to secure such legislation as would put an end to slavery. The movement assumed several aspects. An attempt was made to tax the slave-trade to its death; but this only gave the trade legal recognition, and emboldened the traffickers in human flesh. Nor was a tax levied against the

colonial slave-trade, as such. Slavery had been fostered by the crown; and every royal governor sent to the British-American colonies was strictly charged to give his official aid to the slave-trade. Until the "Stamp Act" and "Tea Tax" the people were loyal to the mother-country; and, therefore, the colonial agitation found few prominent adherents. From 1750 till the war of the revolution some efforts were put forth for the liberation of the slaves. James Otis, James Swan, and Nathaniel Appleton were the practical leaders of the agitation. The impending revolution was favorable to the enslaved blacks, and the free negroes and mulattoes lost no opportunity of making converts to the cause of universal freedom.

Although the free negroes of the colonies were exempted from militia service, they patriotically rallied with the colonists at the outbreak of the revolution. At the battle of Bunker Hill Peter Salem and Salem Poor distinguished themselves. When the army was reorganized, in the summer of 1775, both the "Committee of Safety" and the "Council of War" at Gen. Washington's head-quarters were averse to the employment of negroes as soldiers. But public sentiment was not friendly to such conduct on the part of a people who claimed to be struggling for liberty, and, after a few months of agitation, negro soldiers were incorporated into the "Continental Army." They shared the hardships, conflicts, and victories of the Continental troops. They were engaged in the battles of Rhode Island, Point Bridge, Germantown, Saratoga, Yorktown. Nor were the English indifferent to the value of the negro as a soldier. They offered him freedom and the pay and bounty of a British soldier as an inducement to enlist in the royal army. Some few hundred accepted the offer, and faithfully served in the English army till it was withdrawn by Sir Guy Carlton, when they sailed away with the retiring troops. The Americans acted with the same fidelity towards the negroes who had supported their standard in the war. In most of the colonies slaves as well as free negroes had been accepted as soldiers; and, while the slaves were manumitted, the masters were compensated.

Notwithstanding the anti-slavery feeling—which was almost wholly confined to the Northern colonies—before and during the war of the revolution, slavery was not checked to any considerable extent. Such slaves as had served as soldiers were *ipso facto* free; but the thousands who had performed agricultural labor, while they had been loyal to the American cause, were still in bondage. The slave-trade from the West Indies and Africa had practically ceased since the war of the revolution; but the inter-colonial trade in slaves continued. In the New England colonies there sprang up a movement among the people to rid themselves of an institution that had been established by the British government. Slavery was not extinct until nearly a generation after the Declaration of Independence. But while the Northern colonies desired the abolition of the institution of slavery, and sought to effect it by legislation and voluntary manumission, the Southern colonies clung to it as a basis of their present and future prosperity.

In the Constitutional Convention of 1787 the slavery question occupied a large place in the debates. The delegates from the Northern colonies were not more zealous for free ships than the Southern delegates were for slaves. Four questions were to be decided—the legal status of the slave; the right to reclaim fugitives from labor and service; the basis of Southern political representation, and the prohibition of the slave-trade. The delegates from the Northern States made some show of opposition to the slavery question, but finally yielded to the demands of the Southern delegates. An attempt to abolish the slave-trade by law was defeated by the Southern members; and the representatives of the Northern colonies effected a compromise by which the South was to have twenty years of the foreign slave-trade, and the North the

exclusive right to enact navigation laws. The Southern delegates insisted upon having the slaves of their section counted as three-fifths of their ratio of representation in Congress. They won their point; and the negro slave made his appearance in the Constitution as "a person;" and authority was secured to return any such person who might be a fugitive from "labor and service" to those to whom such labor and service were due.

Before the opening of the nineteenth century the Quakers of the Eastern and Middle States had shown their opposition to slavery. On Nov. 9, 1789, Benjamin Franklin, President of the "Pennsylvania Society for Promoting the Abolition of Slavery, and the Relief of Free Negroes unlawfully held in Bondage," had addressed a memorial to Congress praying that body to enact some law abolishing slavery. In 1800 Congress received a petition from Quakers, asking redress for some free negroes who had been unlawfully enslaved. Abolition societies were then forming. Public sentiment was being created in favor of liberty, and the triumph of the movement seemed to be but a question of time.

By the "Ordinance of 1787" slavery had been excluded from the "Territory of the North-west;" and all States formed out of that territory were expected to prohibit slavery by their constitution. In March, 1818, the citizens of Missouri petitioned Congress for permission to form a constitution and be admitted into the Union as a State. The question as to whether the fundamental principle of the republic was liberty or slavery was now for the first time raised. Missouri wanted a constitution establishing and protecting slavery; and after a struggle of nearly two years the cause of slavery triumphed, and the Missouri compromise was enacted.

On the part of the South the compromise was a gain by the extension of slavery and the admission of a new slave State. On the part of the North it was a guarantee of a prohibition of slavery in future States. But the Southern statesmen fought the battle for slavery over again when other States asked to be admitted into the Union. Kansas was saved to liberty only by the eternal vigilance of patriots, and by the expenditure of much treasure and blood.

The anti-slavery movement of the colonial period, and the consistent efforts of the Quakers, had at length aroused the public conscience that had nodded over this question for so long. At the very time the struggle between slavery and freedom was in progress in Missouri, Benjamin Lundy, the chief apostle of universal emancipation, was at St. Louis. Already in 1815 he had organized an anti-slavery society, "the Union Humane Society," at St. Clairsville, Va. In 1828 he made the acquaintance of William Lloyd Garrison, who subsequently became associated with him as editor of the *Genius of Universal Emancipation*, at Baltimore, Md. The free negroes of the United States began early to write and speak in behalf of their enslaved kinsmen; and the service they rendered the cause of freedom was both creditable to their brain and heart. Many of them served as conductors on the "Under-Ground Railroad," and made sacrifices to aid their escaping brothers to Canada, where they would be beyond the reach of United States marshals. During the period of the anti-slavery agitation more than 30,000 fugitive slaves found homes in Canada, while at least 21,000 were established in their freedom in the Northern States and territory.

The Abolitionists and negroes of the North were opposed by a violent and mobocratic spirit in all sections of the country. Anti-slavery papers and books, when sent South, were taken from the mail-pouches and burned. Persons travelling in the South were frequently suspected of anti-slavery sentiments and consequently cast into prison. In the North Garrison had been thrown into jail at Baltimore; Lovejoy's

press had been burned at Alton and his life taken; Pennsylvania Hall had been destroyed at Philadelphia; Abolition meetings had been broken up, and the right of free speech and free press generally denied to the friends of freedom.

In some parts of the South the free negroes were considerable in numbers, and while they might legally acquire property and secure to themselves the blessing of education, they were denied intercourse with the slaves lest they should incite them to acts of violence and bloodshed. And although the slaves were docile and tractable they were, nevertheless, capable of bitter resentment at times. Denmark Vesey, in South Carolina, "General" Gahiel and Nat Turner, in Virginia, with other negro insurrectionists, between 1797 and 1831, had taught the slaveholders the danger of underestimating negro courage. In 1839 an intelligent and brave African captive, named Cinque, led a number of his fellow-countrymen, who were being conveyed from Cuba to another Spanish island on board the ship *Amistad*, in a desperate effort for liberty, in which they slew their captors. The whites, whose lives they spared, were imprisoned, and, ignorant of navigation, they placed a Spaniard at the wheel with orders to sail for Africa. He obeyed in the daytime, but at night turned about and steered for the United States. Capt. Gedney, U. S. brig *Washington*, discovered the *Amistad* and brought her to New London, Conn. After a long and exciting trial the Africans were liberated. In 1841 an American slaver, the *Creole*, with 135 slaves on board, sailed from Richmond. In the early part of November, when the *Creole* was near the Bahamas, one Madison Washington, an intelligent and intrepid negro, led eighteen of his fellow-slaves in a revolt against their owners. They killed a slave-trader and wounded the captain and several other whites, and then put into Nassau, New Providence, where, after some waiting and much bitter diplomatic correspondence between the United States and England, they all obtained their freedom. The free negroes of the Northern States were excluded from the militia and denied, quite generally, the right to vote, although taxed. Their schools were separate, few in number, and poorly conducted. Frequently they were the objects of cruel and murderous mobs who sought them out in the seclusion of their homes and maltreated them. They were excluded from churches, confined to the galleries of theatres, denied entertainment at hotels, and were not permitted to travel as first-class passengers upon land or water. Nearly every State constitution contained the word "white" as a restriction of civil rights; nearly every common-carrier company had special rules to apply to the negro; nearly every community contained men and women who were always ready to denounce and abuse the blameless and inoffensive blacks.

In 1850 the original Fugitive Slave law of 1793 was altered by Congress so that a master could go into a free State and, without any regard to the laws of that State, claim a negro as his property and take him South. The negro was denied the writ of *habeas corpus*; he could not testify in court, nor could he demand a trial by jury. The U. S. marshal of the district in which the alleged fugitive "from labor and service" was discovered was required to deliver him up, and was empowered to call the *posse comitatus* if the exigencies of the case required it. Citizens who attempted to aid the fugitive were liable to heavy fines. The slaveholders did not hesitate to avail themselves of the wide-sweeping provisions of this law, and its enforcement soon fanned the flame of anti-slavery sentiment of the free States into a blaze of indignation. Shadrach, a fugitive slave, had been rescued from a U. S. court-room at Boston by the friends of freedom; and Thomas M. Sims, another fugitive, would have been rescued from slave-hunters had he not been arrested upon a charge of theft and then held as a fugitive slave. The rendition of An-

thony Burns by the U. S. marshal at Boston; the *posse comitatus* of 100 respectable citizens of Boston; the company of U. S. marines and artillery with shotted cannon; the U. S. revenue cutter at the wharf, sent by the order of Pres. Pierce to convey the heavy-hearted and manacled slave back to the bondage from whence he had escaped, were the chief features of one of the most dramatic events in the history of the slave-power in America.

Next in historical importance was the *DRED SCOTT CASE* (*q. v.*). The opinion of the court was delivered by the Chief-Justice, Roger B. Taney, March 6, 1857. He maintained that neither persons of African descent, imported into the United States, nor the descendants of such persons, were citizens of the United States under the Constitution; that the framers of that instrument never intended to confer upon them such a right; that the only two references to them in the Constitution relate to them as property; that a negro could not become a citizen, and that Dred Scott was not a citizen of Missouri, and, therefore, dismissed the case. From this opinion Justices McLean and Curtis dissented; but the Chief-Justice spoke for the slave-power. The confusion, alarm, and dissatisfaction created in the North by the decision was unprecedented; and the people, through public meetings called to denounce the decision of the court, and through the newspapers, defied the bold attempt to prostitute the Constitution for the destruction of human freedom.

During the administration of Pres. Buchanan the attention of the whole country was riveted on Kansas, where a desperate struggle for the extension of slavery over territory declared free by the Missouri Compromise was then taking place. Hardly had it closed in favor of freedom than the irrepressible conflict seemed to be transferred to the soil where slavery had first been planted in the limits of the United States. On Oct. 16, 1859, Capt. John Brown, at the head of 21 men, captured the U. S. arsenal at Harper's Ferry, Virginia, and held it until the 18th, when it was retaken by a company of U. S. marines. Brown's object was to emancipate the slaves of the States of Virginia and Maryland and not to take life except in self-defence. With five of his men he was tried by a court of Virginia, convicted, and hanged on Dec. 2. Though his attempt was thus easily quelled, it sent a thrill of terror through the slaveholding States.

Southern leaders insisted on new constitutional guarantees for the safety of their peculiar institution, while a majority of the people of the North demanded the perpetual exclusion of slavery from territory repeatedly dedicated to freedom. The Republican party organized to carry out this policy triumphed at the polls in November, 1860, and elected Abraham Lincoln to the presidency. The heated and unscrupulous partisans of slavery urged forward their States to secession and rebellion without waiting for his inauguration.

Although the war of the rebellion was brought on by the slavery question, both the Union and Confederate governments strove, during the early months of the conflict, to avoid it as an issue. The Union army surrendered fugitive slaves to rebel masters who were permitted to come within the lines in pursuit of their chattels. Gen. B. F. Butler shrewdly declared such fugitives contraband of war, but a great majority of Union officers surrendered the slaves who sought shelter in their camps from their masters. In Louisiana, South Carolina, and Kansas negroes were mustered into the military service of the United States as early as 1862, and before the spring of 1863 the U. S. government published a plan by which negroes, free and bond, were to be employed as soldiers. By the end of autumn 50,000 troops of this character were under arms. From the beginning to the close of the war there were 178,975 negro troops in the ser-

vice of the nation, who participated in 449 engagements and sustained a loss of 36,847. At Fort Wagner, Port Hudson, Chapin's Farm, Nashville, and upon other fields they won the confidence and approval of the military and civil leaders of the cause they so gallantly served. Doubtful and discriminated against in respect to their pay, bounty, and clothing, they were subsequently placed upon the same footing with their more favored white comrades. The war had propounded several difficult problems that the government was, at first, unprepared to solve; but history pointed to the past annals of the nation for guidance in the war of the rebellion. The exigencies of a war between Great Britain and her colonies in North America gave the negro his position as a soldier in the war of the revolution. In the second war between America and England the services of the free negroes of Louisiana had been secured upon the same terms as other troops. Their valor received the official notice of Gen. Andrew Jackson, and the applause of the national Congress. But in the war of the rebellion it became necessary to emancipate 4,000,000 slaves to save the Union. Pres. Lincoln's preliminary proclamation of emancipation was issued Sept. 22, 1862. He warned certain States, engaged in armed rebellion against the government and authority of the United States, that if they should be still engaged in rebellion on Jan. 1, 1863, he would then issue a final proclamation emancipating their slaves. On that date, accordingly, the President, by virtue of the war power, proclaimed the slaves of the enemies of the Union forever free.

After the war was over the government was charged with the grave and difficult work of reconstructing the insurgent States. Before the war had come to a close a Bureau of Refugees, Freedmen, and Abandoned Lands (see FREEDMEN'S BUREAU) had been established by an act of Congress. It made provision for needy and deserving white refugees and freedmen, and encouraged and fostered a system of education and agricultural industry. Pres. Andrew Johnson, who had succeeded Lincoln, at first posed as the "Moses of the negro," but later opposed the giving of the right of franchise to the black race. He vetoed every measure passed by Congress calculated to give protection and political rights to the freedmen. Congress passed over his vetoes the Thirteenth and Fourteenth Amendments to the Constitution, and all the legislation necessary to restore order, justice, and political government to the insurgent States. Slavery was rendered forever impossible, and the negro was made a citizen and a voter by amendments to the Constitution.

Pres. Johnson's defiant attitude towards Congress and his opposition to the enfranchisement of the negro, as well as his sympathy with and support of the rebel element of the South, led to great disorder and bloodshed in the insurgent States. Encouraged by the recognition from the President, and from the Northern politicians that supported him, some people of the South entered into a conspiracy against the legal results of the great war as engrafted upon the Constitution. A secret organization, called the "Ku-Klux-Klan" began a series of barbarous outrages. Negroes and loyal white men were whipped and their property burned. Hundreds were murdered in cold blood, and the larger Southern cities were the scenes of frequent riots. All the laws of Congress respecting the rights of the freedmen were set at naught and the work of reconstruction greatly embarrassed, if not defeated. The Legislatures of the insurgent States, controlled by men still possessed with the very ideas which had led to rebellion, passed laws that practically disfranchised the freedmen, and the acts regulating negro laborers made them the merest vassals of the soil.

The speedy failure of Pres. Johnson's policy of restoration left an open field for Congress to operate in. The insurgent States, being divided into five mil-

itary districts, all persons who took an oath of allegiance were registered as voters. New elections were ordered for State constitutional conventions; new constitutions were submitted to a vote of the people, and State officers were elected who were friendly to the amendments to the Constitution of the United States. These States were subsequently admitted to the Union and allowed representation in Congress. This was the beginning of the political career of the Southern negro. Inexperienced, ignorant, and pliable, he soon became the foot-ball of political parties, and the local administrations with which he identified himself were notorious for their imbecility and corruption. The negro, however, sinned less than he was sinned against, and the Republican State governments of the South were ultimately extinguished by tissue ballots and assassins' bullets.

During the period of reconstruction negroes were in the majority in the Senate and House of Representatives of some Southern States, while two became U. S. senators and a dozen were members of the House of Representatives. Fourteen held positions in the diplomatic and consular service of the government. The U. S. marshal for the District of Columbia, the tax-collector, the recorder of deeds, and the register of the treasury were, at one time, negroes, and all of them ex-slaves save one. There were about 600 negroes in the departments at Washington, D. C., and several thousand of them in the postal, revenue, and customs service in various sections of the country.

The negro is not so prominent in American politics now (1888) as he formerly was when the Republican party was in power. But there are unfailing signs that he is accumulating property and rapidly acquiring knowledge. In the District of Columbia, where the government emancipated the slaves by compensating their masters, the negro citizens pay taxes upon about \$8,000,000 of real property; in Georgia they are taxed for about \$11,000,000; in Louisiana, for about \$25,000,000; and in other States in an almost proportional amount. Their morals are improved, their social life more elevated, their deportment more correct, and their tastes more chaste and elegant.

The ninth census of the population of the United States seemed to indicate that the negro race in America was doomed to speedy extinction. From a population of about 4,500,000 in 1860 it had risen, according to the ninth census, to but 4,886,378 in ten years. But the census of 1880 exhibited that the race had reached 6,580,793, an increase of 34.67 per cent. in ten years. At present (1888) the negro school population of the former slave States is 2,020,219, and the enrolment is 1,048,659, a percentage of 55.8. They have 281 normal schools with 6207 students; 270 institutions for secondary instruction with 9970 students; 238 universities and colleges with 5119 students; 110 schools of theology with 1297 students; 16 law schools with 98 students; 22 schools of medicine, dentistry, and pharmacy with 208 students; 40 schools for the deaf, dumb, and blind with 139 students; and, adding the 661 schools for negroes in the Northern States to the 18,794 for the freedmen, there are 19,455 public schools with a total enrolment for the race, as far as reported, of 1,127,839. But this does not include the negroes and mulattoes in the schools of the North where no discrimination is made as to color or nationality. There are more signs of improvement among persons heretofore held in bondage and the descendants of such persons than in the small communities of Northern negroes, who, contented with their condition, make little effort to improve their opportunities. They are the servant class as a rule, although there are worthy exceptions, and make little or no progress. However, in the larger cities of the Northern States negroes have branched out into lucrative business enterprises, and by industry, frugality, and ability have attained to high and honorable business standing. Prejudice is yielding to a better feeling toward this race among the

more enlightened, and wherever character and talent are exhibited they have been appreciated and applauded. It is different in the old slave States, since the prejudices and customs of centuries will not yield to nobler sentiments in a few decades. When the freedman acquires both education and property he will return to politics as a potent but peaceful factor; and his rights, so long denied, will be accorded him as the irresistible logic of civilization. Meanwhile, the friends of humanity, in all sections of a common country, will create a public sentiment friendly to the negro as a citizen, as a laborer, and as a man. Within two centuries the black race will have been merged into a composite American nationality, and the legends of its wrongs will have been wrought into a literature that will thrill the heart of the civilized world with passionate grief.

List of Authorities Consulted:—Hakluyt's Voyages; Holmes' American Archives; Court and Times of James First; Chalmers' American Colonies; Hildreth's History of the United States; Palfrey's History of New England; Force's American Archives; Voyages of the Elizabethan Seamen; Some Account of the Trade in Slaves from Africa, as Connected with Europe and America; Astley's Voyages; Eward's West Indies; Jouselyn's Voyages; The Hutchinson Papers; The Madison Papers; The Journals of Congress; Elliot's Debates; Hurd's Bondage and Freedom; Mott's Sketches, etc. (G. W. W.)

NEHLIG, VICTOR, a French-American painter, was born at Paris in 1830. He studied under Abel de Pujol and Cogniet. He settled at New York in 1856, and was made a member of the National Academy in 1870. Several of his pictures relate to American history and romance. Among these are Gertrude of Wyoming, Hiawatha and Minnehaha, and Pocahontas.

NÉLATON, AUGUSTE (1807-1873), a French surgeon, was born at Paris, June 17, 1807, being son of a captain of the Imperial guard, killed at Wagram. He studied medicine and surgery under Dupuytren, and received his degree in 1836. He became adjunct professor in the faculty of Paris in 1839, and after a competitive examination in 1851, professor of clinical surgery. In 1844 he published his *Éléments de pathologie chirurgicale*, which established his reputation as an expositor. The work was enlarged by his pupils and passed through many editions. In 1856 Nélaton was admitted to the Academy of Medicine, and in 1867 to the Academy of Sciences. His professional practice extended throughout France and even beyond its borders. In 1862 he astonished the world by his cure of Garibaldi's wound, received at Aspromonte two months before Nélaton reached him. In 1866 he was made surgeon to Napoleon III., and having effected a remarkable cure in the case of the prince imperial, he was made grand officer of the Legion of Honor, and senator. He died at Paris, Sept. 22, 1873. His lectures were noted for their clearness and his operations for their almost magical success. With the simplest possible means he seemed to achieve the most important results. His improvements in surgery were happy modifications of pre-existing methods rather than entirely original processes. He assisted in the *Rapport sur les Progrès de la Chirurgie* (1867), and published some special treatises.

NELSON, DAVID (1793-1844), clergyman, was born near Jonesborough, Tenn., Sept. 24, 1793. He graduated at Washington College, Va., in 1810, and studied medicine at Danville, Ky., and at the Philadelphia Medical School. He was surgeon of a Kentucky regiment in the war of 1812. For a time he was a skeptic, but, returning to the religious belief in which he had been trained, gave up his medical practice and became a Presbyterian minister in 1825. After preaching in various parts of Tennessee and Kentucky, he removed in 1830 to Marion co., Mo., where he established a college. He was an advocate of emancipation and in 1836, on account of disturbances arising from this cause, he removed to Quincy, Ill., where for a time he

conducted a training school for missionaries. He died at Oakland, Ill., Oct. 17, 1844. He was the author of *The Cause and Cure of Infidelity*, which had an extensive circulation.

NELSON, THOMAS (1738-1789), a signer of the Declaration of Independence, was born in York co., Va., Dec. 26, 1738. He was educated at Trinity College, Cambridge, England, and while on his way home in 1759 was elected to the house of burgesses. He was member of provincial conventions in 1774-75, and was made colonel of the Second Virginia regiment, but resigned on being elected to the Continental Congress. Here he signed the Declaration of Independence. He opposed the sequestration of British property; he made large advances from his private property for the benefit of the State, and was thereby greatly embarrassed. In 1781 he was governor of Virginia, and called out the militia to oppose the British, who were then ravaging the State. He died at Yorktown, Va., Jan. 4, 1789. Two of his brothers were officers in the revolutionary army.

NELSON, WILLIAM (1825-1862), general, was born at Maysville, Ky., in 1825. He entered the navy in 1840, and commanded a naval battery at the siege of Vera Cruz in 1847. He rose to the rank of lieutenant, and in 1858 was on board the Niagara, which carried back to Africa the negroes taken from the slaver Echo. At the outbreak of the civil war he was on ordnance duty in Washington, and was sent to command the gunboats on the Ohio. Being placed under the authority of the Secretary of War, he organized camps in Kentucky for the mustering of Union troops. He was made brigadier-general Sept. 16, 1861, and commanded the second division of Buell's army at the battle of Shiloh. He took command of Louisville when it was threatened by Gen. Bragg. He was made major-general of volunteers, July 17, 1862. In a personal quarrel with Gen. Jefferson C. Davis, occasioned by his overbearing disposition, he was shot and killed, Sept. 29, 1862.

NEMOURS, LOUIS CHARLES PHILIPPE RAPHAEL D'ORLEANS, DUC DE, was born at Paris, Oct. 25, 1814. He was the second son of King Louis Philippe, but was educated as one of the people at the Collège Henri IV., and gave especial attention to science. In 1834, after he had served two campaigns in the field, he was made marshal. In 1836 he went to Algeria, where he rose to the rank of lieutenant-general. In 1840 he married the Duchess of Coburg-Gotha (1822-1857). The premature death of his elder brother gave him increased importance, but though he was diligent in performing public duties his popularity was never great. At the outbreak of the revolution of February, 1848, he was in command of a body of troops and he accompanied the Duchess of Orleans when she made an ineffectual appeal to the chamber of deputies. After assisting the royal family to escape to England, he fixed his residence at Claremont. He remained quiet during the reign of Napoleon III., but after his downfall in 1870 obtained permission to return to France, and was soon restored to the list of generals. Even then he did not busy himself in the attempts at a fusion of the monarchical factions. In September, 1873, with his nephew, the Duc de Chartres, he visited the Comte de Chambord at Frohsdorf. In 1879 he was placed on the retired list.

His son, Louis, Comte d'Eu, born April 28, 1842, married the eldest daughter of Dom Pedro II., Emperor of Brazil, and is a marshal of the Brazilian army. His second son, Ferdinand, Duc d'Alençon, was born July 12, 1844, and became a captain in the French artillery. He married Sophia, daughter of Duke Maximilian of Bavaria. In 1886 republican jealousy required him to leave the army and depart from France.

NETTLETON, ASAHEL (1783-1844), evangelist, was born at North Killingworth, Conn., April 21, 1783. He graduated at Yale College in 1809, studied theology

at New Haven, and was licensed to preach in 1811. He was ordained in 1817, but still continued the work of revival preaching to which he had devoted himself. After laboring with great success in Massachusetts, New York, and Connecticut, he went to Virginia in 1827, and to Great Britain in 1831. He was appointed professor of pastoral theology in the seminary founded at East Windsor, Conn., in 1832, and without accepting the chair delivered lectures to the students. He died at East Windsor, Conn., May 16, 1844. Rev. Dr. B. Tyler edited his *Remains and Sermons* and published a *Memoir* (1844), but he was most widely known by the collection of hymns bearing his name.

NEUKOMM, SIGISMUND (1778-1858), a German composer, was born in Salzburg, July 10, 1778. He was partly instructed by Haydn, and in 1804 became director of the German opera at St. Petersburg, but retired on account of ill health. He taught music at Vienna and Paris, and in 1816 went to Rio de Janeiro. In 1821 he returned to Paris, living at Talleyrand's house, and went with him to England in 1830. Towards the end of his life he became blind. He produced about 800 compositions of all kinds—operas, cantatas, symphonies, songs, etc. His most noted works are his oratorios *Mount Sinai* (1831) and *David* (1834), which are still performed. He died at Paris April 3, 1858.

NEUMANN, KARL GOTTFRIED, a German mathematician, was born May 7, 1842, at Königsberg, where his father, Franz Neumann, was professor of physics and mineralogy in the university. Here he was trained, but in 1858 he became privat-docent in mathematics at Halle, and in 1863 professor extraordinary. He afterwards held professorships at Basle, Tübingen and Leipzig. He has given special attention to mathematical problems connected with heat, light, and electricity. Among his publications are *Theorie der Electricitäts- und Wärmeverteilung in einem Ringe* (1864); *Theorie der elektrischen Kräfte* (1873); *Hydrodynamische Untersuchungen* (1863).

NEUTRALITY. The rules formulated by the Treaty of Washington, 1871, have added to the duties of England and the United States as neutrals, but, owing to a difference of opinion as to their interpretation, other nations have not been invited to accede to them.

A government may not sell munitions of war to a belligerent, but its subjects may, provided they sell indifferently to both parties, and the transaction is a purely commercial one. A belligerent has the right of seizing such goods as contraband, when on their way from the neutral state to the enemy. The *bona fide* sale of a ship intended for war, by citizens of a neutral power, is a commercial venture and is not forbidden by international law, but the difficulty of distinguishing between such a sale and the organizing of a hostile expedition has led England to prohibit such sales to belligerents altogether.

In the case of the ship *Alabama*, built at Liverpool, England, during the American civil war, for the Confederate States, the British authorities were notified of the purpose for which she was being constructed, but allowed her to sail, without armament, which she subsequently received by two other English vessels from the same port. A great deal of damage was done by this vessel to American commerce, the claims for which were subsequently submitted to arbitration, the award being in favor of the United States, on the grounds that Great Britain had failed to use due diligence, and that after the escape of the vessel the measures taken for its pursuit and arrest were so imperfect as to lead to no result, and therefore could not be considered sufficient to release Great Britain from the responsibility already incurred; also that the ship was on several occasions freely admitted into the ports of the colonies of Great Britain, instead of being proceeded against, as it ought to have been. (See ALABAMA CLAIMS.)

There are well-known exceptions to the general free-

dom of neutral commerce with belligerent powers. Certain articles are said to be contraband of war. A complete list of goods always to be deemed contraband, and therefore liable to seizure, has never been made. The main point is whether the article is intended or would probably be applied to military purposes. In England and America the court before which the goods are brought will inquire into all the circumstances of the case and condemn or release them accordingly. Any treaty stipulations will of course be taken into consideration. The Supreme Court of the United States has said that articles manufactured and primarily or ordinarily used for military purposes in time of war are always contraband, while articles which may be and are used for purposes of war or peace may or may not be contraband. Of the same nature with the carrying of contraband goods is the transportation of military persons or despatches in the service of the enemy: a neutral vessel transporting the forces or despatches of one belligerent is liable to confiscation, if captured by the other. The United States have contended that this applies to diplomatic agents, the contrary, however, being maintained by England and the Continental nations. Where the ship and cargo do not belong to the same person, the contraband articles only are confiscated. The articles must, however, be taken in *delicto*, in the actual prosecution of the voyage to an enemy's port.

Another exception to the general freedom of neutral commerce in time of war is as to the trade to ports blockaded by one of the belligerents. While a neutral subject is under no positive duty imposed by the law of nations to abstain from blockade-running, he is yet exposed to the chance of losing his ship and cargo if unsuccessful. The duty of a neutral state consists simply in letting its subjects engage in such traffic at their own risk, and abandoning them to the prize courts of the belligerent who may capture them. A blockade must actually exist and be carried on by an adequate force, and not merely declared by proclamation, to render commercial intercourse with neutrals unlawful. Notification of the existence of the blockade, however, is essential, unless actual knowledge thereof can be proved against the person charged with its violation. An act of violation is essential to a breach of blockade; as either going in or coming out of the port with a cargo laden after the beginning of the blockade. A mere intention to violate is not sufficient ground for condemnation. The intent must exist, however, to constitute the *delictum*, and must be inferred from the ship's papers, acts of the owners, officers, etc. (T. B.)

NEUVILLE, ALPHONSE MARIE ADOLPHE DE (1836-1885), French painter, was born at St. Omer, May 31, 1836. Though his predilection was always for art, he studied law in accordance with the wishes of his family. He passed his examinations successfully, but still devoted his time to drawing. He received some lessons from Picot, but soon left his studio. His first painting, *A Scene from the Siege of Sebastopol*, was exhibited in 1859 and received a medal. Delacroix gave the young artist advice and encouragement. He illustrated Guizot's *History of France* and some other works, but soon devoted himself to paintings of battles and soldier-life. In 1864 he achieved marked success with his *Chasseurs and Zouaves in the Streets of Magenta*; in 1866 with his *Zouave Sentinel*. In the war of 1870 De Neuville was commissioned as an engineer officer and took part in some engagements, but his chief object was to obtain material for his art. His *Bivouac before Le Bourget* (1872) was purchased for the museum at Dijon, and his *Last Cartridges* (1873) obtained for him admission to the Legion of Honor. Among his latest works were *The Cemetery of St. Privat* (1880), *The Dispatch-Carrier* (1881), and *Rorke's Drift*, a scene from the Zulu war. He died at Paris May 19, 1885. His works are strongly realistic, yet full of romantic

suggestions. They have been popularized by photographs and engravings.

NEVADA. This State lies east of California and extends to the 114th meridian W. from See Vol. XVII. Greenwich. Its remarkable geological features have been largely discussed under GREAT BASIN (*q. v.*). In spite of the manifest sterility of a large part of its surface

there was a time when it was thought to give promise of rivaling California in prosperity. In 1858 its rich silver mines were discovered and in 1861 it was separated from Utah, of which it had formed a part, and organized as a Territory. In 1864 it was admitted as a State, though still having much less than the full ratio of population required for a single representative in Congress. The population, which by the census of 1860 was only 6857, had probably quadrupled, and it was expected to increase rapidly. In 1870 it was 42,491, and in 1880 it reached 62,266, showing an increase of 46 per cent. for the decade. In the presidential election of 1880 the total vote was 18,343, the Democratic majority being 879. In the presidential election of 1884 the total vote fell off to 12,771, the Republican majority being 1615. In November, 1886, the total vote for governor was 12,362, the Republican majority being 594. These returns indicate that the present population scarcely exceeds that of 1880. It is certainly less than half of the average required for a representative in Congress (154,325).

The failure of Nevada to realize its early expectations is due not merely to the aridity of the larger portion of its surface, which prevents profitable agriculture, but also to the diminution in amount and value of the products of its mines. Their enormous output for several years had astonished the world. The sudden excess of silver violently disturbed the ratio of the precious metals and so alarmed the nations of Europe that they joined in demonetizing silver. The depression of the silver market of the world reacted disastrously on the "Silver State." Congress, however, has endeavored to sustain its interests, not only by maintaining the double metallic standard which other nations have discarded, but by ordering the secretary of the U. S. treasury to coin \$2,000,000 or more of silver each month. This law still holds in spite of protests of more than one secretary of the national treasury. But physical causes also contributed to the depression of the people of Nevada. The bonanzas of the Comstock mines were exhausted. The ores, taken from great depths at greatly increased expense, showed a very low average assay. Deep mining was finally abandoned and all the interests of the State suffered in common with the one which had given Nevada its early promise and bright prospects.

Since 1885, however, in the upper levels of the famous Comstock mines there have been discovered valuable deposits of ore, which were overlooked while the search was directed chiefly to bonanzas, or masses of almost pure silver. Some of these mines, after an interval of five or six profitless years, have again begun to pay dividends. Mines were discovered and opened in other parts of the State. In 1887 the bullion from the Comstock mines exceeded \$5,000,000, more than twice the amount for 1885. In 1888 the total output for the State was estimated at \$8,000,000.

Live-Stock.—Grazing is the next most important

interest to mining. Sheep-walks and cattle-ranges have become numerous in the northern counties, though less than a fourth of the total area is devoted to this purpose. The counties of Washoe, Elko, and Humboldt take the lead, but others are advancing in this respect. While the native bunch-grass, and even some varieties of the sage brush which everywhere abounds, have been found excellent food for cattle, the nutritious alfalfa has been largely introduced for this purpose. In the peculiar climate of the Great Basin the grass is cured on the soil without human aid. In 1887 there were in Nevada 17,683 milch-cows, valued at \$638,256; 317,059 oxen and other cattle, valued at \$6,949,933; 674,486 sheep, valued at \$1,153,371; 14,543 hogs, valued at \$77,339; 44,654 horses, valued at \$2,461,449; and 1657 mules, valued at \$121,251. There has been no loss in Nevada from pleuropneumonia, which has made such ravages elsewhere. Cattle from Nevada are largely shipped to San Francisco.

Agriculture.—Although the greater part of the soil is unfit for agriculture, there are fertile regions, especially in the valleys. Here the climate and soil are well adapted to the raising of cereals and vegetables. The fruits of Nevada are of excellent flavor and quality. At the New Orleans Industrial Exposition in 1884-5 Nevada made a very creditable display of productions, mineral and vegetable. To this State were awarded the first premiums for wheat and for potatoes, and the silver medal for apples.

Irrigation.—A proper system of irrigation and legal regulations for the use of water are greatly needed in Nevada. While there are in some places corporation ditches and several Legislatures have discussed the subject and passed various laws, the State has not yet undertaken to provide storage reservoirs in which water could be collected during the flood season and be distributed as needed during the dry season. Until this is thoroughly and effectually done, nine-tenths of the water will continue, as at present, to run to waste.

Constitutional Amendments.—The State Constitution requires that an amendment shall be passed by two successive Legislatures, and then be submitted to a vote of the people and ratified by them before becoming part of the organic law. As the population is still fluctuating and their needs and desires are rapidly changing, these restrictions on their legislative action have been found too severe for their circumstances. It has, therefore, been proposed to alter the Constitution so that a proposed amendment, if passed by a two-thirds vote of the Legislature, may then be submitted to the people. This amendment is to be voted on at the election in November, 1888. Ten other amendments are pending at various stages. One abolishes the office of lieutenant-governor, others relate to the power of the Legislature and its time of meeting, and one imposes on the State instead of the several counties the duty of providing for infirm and indigent citizens. Another proposed amendment is to make women eligible for school-officers, while another is to deprive Mormons of the elective franchise. There is a general tendency, in the interest of economy, to diminish the number of State and county officers, and to lessen public expenses.

Finances.—The total assessed valuation of real and personal property, and of the net proceeds of mines during the year 1887, was \$27,997,339. From this the State obtained, by a tax of 90 cents on \$100, a revenue of \$251,976. The amount paid by all the counties (save one) was \$225,374. The total State receipts for year ending Jan. 1, 1887, were \$794,702.58. The expenditures for the same time were \$702,670.52. The total amount raised by taxation was \$537,499. The State debt was \$484,484, funded partly at 4 and partly at 5 per cent.

Railroads.—There are in Nevada altogether 922 miles of railroad. The Central Pacific is the grand trunk line of the State. It has 450 miles of main line;

its chief branches are the Virginia and Truckee, running south from Reno to Virginia City, 52 miles; the Nevada and Oregon, running north from Reno, has 28 miles in Nevada; the Nevada Central, running south from Battle Mountain to Ledy, 93 miles; the Eureka and Palisade, running south to Eureka, 90 miles. Some of these have also smaller local branches. On all railroads in the State Indians are allowed to ride free.

Education.—In 1887 the total number of children under 21 was stated to be 14,537, of whom 14,236 were white. The attendance in the public schools was reported at 9828, but four districts failed to report. From the State school fund over \$63,000 was apportioned among the districts. This fund contained \$147,632.53 in cash, while State and U. S. bonds swell the total to \$981,256. Part of the school fund was used in building the State Insane Asylum, at Reno. In 1885 the Nevada State University was transferred from Elko in the eastern, to Reno in the western part of the State. In February, 1886, the new building, costing about \$20,000, was opened with two instructors and 56 students, chiefly in the preparatory department. There is a State Orphans' Home in Carson City, with 52 inmates.

Indians.—There are in Nevada about 9500 Indians; 4500 Pah-Utes, 300 Pi-Utes; Shoshones, 4200, and Washoes, 500. About 1300 remain permanently on the three Indian Reservations, Pyramid Lake, Walker Lake, and Duck Valley. Nearly 9000 of them wear citizens' dress. About 900 speak English, and about 400 can read. On the reservations the schools are well attended, but elsewhere there is no provision for their instruction. The Indians are generally industrious laborers, but they live around the towns and rely on the white population for employment and support.

(J. C. M.)

NEVIN, JOHN WILLIAMSON (1803–1886), theologian, was born at Shippensburg, Pa., Feb. 20, 1803. He was of Scotch-Irish ancestry, and graduated at Union College, 1821, but on account of feeble health spent the next two years at home. Then entering on the study of theology at Princeton, he became so well versed in Hebrew that when Dr. Charles Hodge went to Europe in 1826, Nevin was appointed to supply the chair of Oriental and Biblical Literature. His handbook of *Biblical Antiquities*, then prepared, had a wide circulation. On being licensed to preach in 1828 he was called to the newly established Presbyterian Theological Seminary, at Allegheny, Pa., as assistant professor of Hebrew and Biblical Literature. Ten years were spent here, during which his character as a leader of religious thought was manifested. On the one hand he opposed slavery, infidelity, and worldly tendencies in the church; on the other he opposed the increasing tendency to individualism in religion. He was thus led to give prominence to the historical church as a divine institution. Regarding the German Reformed Church as more true to the principles and usages of the Reformation he joined that denomination in 1839. He was then made professor of theology in its seminary at Mercersburg, Pa., and in 1840 he succeeded Dr. F. A. Rauch as president of Marshall College there. His tractate on *The Anxious Bench* (1843) caused a brisk controversy within and beyond the Reformed Church. In 1844 Dr. Nevin received as his colleague Dr. Philip Schaff, whose *Principle of Protestantism* he had already translated into English. In 1846 he published *The Mystical Presence*, which set forth the doctrine of the Reformed Church in regard to the Lord's Supper. The theological views here presented met with opposition even in the Reformed Church, but Dr. Nevin earnestly and ably maintained them as the historical creed of the church. With his friends he established in 1849 the *Mercersburg Review*, for the defence and exposition of this theology, and conducted it with ability for four years, when he relinquished the task to others. In 1851 Marshall College had been re-

moved to Lancaster, Pa., and united with Franklin College, and Dr. Nevin retained the presidency until 1853. He then retired from professorial work, but continued to preach and to write. He had also much to do with the preparation of a new English liturgy for the Reformed Church. In 1861 he undertook the duties of professor of history in Franklin and Marshall College, and in 1866 again became its president, and held the office for ten years. Thereafter he lived in retirement at Lancaster until his death on June 6, 1886. Dr. Nevin was one of the foremost theologians of America. He set forth the person of Christ as the true centre of theology, the visible church as his body, and its ministers and ordinances as the appointed channel of divine grace. His views were not summed up in any single work adequate to his reputation, but were given in occasional treatises and discourses and in his contributions to the *Mercersburg Review*. Besides *The Mystical Presence* may be mentioned *The Apostles' Creed: Its Origin, Constitution, and Plan* (1849); *Revelation and Redemption* (1870); *The Revelation of God in Christ* (1871); *Christ and His Spirit* (1872).

His son, **ROBERT JENKINS NEVIN**, during the civil war commanded a battery of artillery, and afterwards took orders in the Protestant Episcopal Church. He has been for some years rector of the American Church of St. Paul's within the walls at Rome, Italy.

NEW ALBANY, a city of Indiana, county-seat of Floyd co., is on the N. bank of the Ohio River, nearly opposite Louisville, on the Louisville, New Albany, and Chicago, the Louisville, Evansville, and St. Louis, and the Jeffersonville, Madison, and Indianapolis Railroads. Two other railroads are in process of construction. The city has a court-house, U. S. government building, 4 national banks, 1 daily and 4 weekly newspapers, 18 churches and 10 schools, and De Pauw Female College. New Albany is the largest manufacturing city in Indiana, having 142 industrial establishments, comprising iron and brass foundries, rolling-mills, flour, woollen, and cotton-mills, tanneries, shoe, chair, basket, and box factories, potteries, stone and brick yards. The glass-works are the largest west of Pittsburgh. New Albany is lighted with gas, and has water-works with 3 reservoirs. Its property is valued at \$9,000,000, and its public debt is \$400,000. Settled in 1814, it was incorporated in 1846. In 1880 it had a population of 16,423, but it is now estimated to have over 20,000.

NEWARK, the principal city of New Jersey, county-seat of Essex co., is on the Passaic River, 3 miles above Newark. Pop. 370,000. Bay and 9 miles W. of New York.

Four railroads maintain frequent communication with the metropolis. The city, excellently laid out with well-paved, shady, and well-drained streets, and several small parks, has somewhat of a rural appearance in spite of its abundant factories, which entitle it to be called the "Birmingham of America." It occupies a site about five miles long by five broad, and on the river front there is a line of docks over a mile long. It has public buildings for city, county, and government purposes, 11 national banks, 5 savings banks, and other financial and insurance companies, 120 churches, a high-school, and 30 public schools, besides excellent private schools. Over 400 manufactories here produce a great variety of articles, including brass- and iron-work, machinery, carriages, saddlery, harness, trunks, hats, hardware, and jewelry. The annual product is valued at \$60,000,000. The city has gas and electric lights, a good supply of water from the upper Passaic, and a paid fire department. Newark was settled in 1666 by a Puritan colony from Connecticut, and the inhabitants have long maintained a high moral and religious character. It received a city charter in 1836, and soon afterward the foreign element largely increased, as it still continues to do. The population in 1880 was 136,508, and is now estimated to exceed 150,000. Its suburbs extend west to Orange, and south nearly to Elizabeth.

NEWARK, a city of Ohio, the county-seat of Licking co., is on the Licking River, 33 miles N. E. of Columbus, on the Baltimore and Ohio, the "Panhandle," and other railroads. The North Fork of the Licking is here crossed by four iron bridges. Newark has a court-house, 5 hotels, 2 national banks, 1 other bank, 2 daily and 4 weekly newspapers, 20 churches, and 5 school-buildings, besides 2 commercial colleges. The industries comprise 3 foundries, making stoves and furnaces, 5 wagon-factories, 2 machine-shops, 4 flouring-mills, 3 planing- and woollen-mills. Newark, one of the early settlements of Ohio, was incorporated in 1826. It has a park, gas-, and water-works. Its property is valued at \$6,000,000, its public debt is \$125,000, and the public expenses \$19,000 yearly. It carries on a good trade in coal, grain, and live-stock. The population in 1880 was 9600.

NEW BEDFORD, a city and port of entry of Massachusetts, half-shire town of Bristol co., is on the estuary of Acushnet River, 3 miles from Buzzard's Bay, 56 miles from Boston, and 31 from Providence. It is the terminus of the New Bedford and Taunton branch of Old Colony Railroad. The New Bedford bridge, 4000 feet long, crosses the estuary to Fairhaven. It has a Doric granite city-hall, court-house, U. S. government building, public library, 3 hotels, 5 national and 2 savings banks, 2 daily and 4 weekly newspapers, 30 churches, a high-school, with fine building, and many public schools. Several of the churches have fine edifices. New Bedford ranks third among the American cities in cotton manufacture. There are 5 corporations, owning 12 mills, running 475,000 spindles. There are also 2 foundries and manufactories of twist-drills for boring metals, cordage, glass, silver-plated ware, carriages, boots, and shoes. The whaling, commenced in 1755, was the principal pursuit of the citizens for a century, but since its decline their attention has been turned to manufactures. At one time over 300 whaling vessels belonged to this port, but the number is now reduced to 80. There are several refineries of sperm and whale oil. New Bedford was settled about 1650 chiefly by Quakers. It was incorporated in 1787, and received a city charter in 1847. It was originally part of the town of Dartmouth, which was incorporated in 1664. The city is regularly laid out, has gas- and water-works, and a park of seven acres, and is noted for the elegance of its private residences. A broad drive of four miles around Clark's Point leads to a strong U. S. fort of granite, and commands a fine view of the sea. The assessed valuation of property is over \$32,000,000; the public debt is \$1,250,000, and the yearly expenses about \$475,000. The population of New Bedford in 1880 was 26,485, and by the State census of 1885 it was 33,393.

NEW BERNE, a city and port of entry of North Carolina, the seat of Craven co., N. C., is at the junction of the Neuse and Trent Rivers, on the Atlantic and North Carolina Railroad, about 90 miles N. E. of Wilmington. The Neuse is here 2 miles wide, and navigable for steamboats. Across the Trent there is a bridge half a mile long. New Berne has a court-house, 2 hotels, 2 banks (1 national), 2 daily and 3 weekly newspapers, 15 churches, and 8 schools. There are railroad-car-shops, 2 machine-shops, wood-pulp-factory, cottonseed-oil-mills, 5 saw-mills, and an oyster-canning establishment. New Berne was settled in 1710 by Swiss immigrants, and was for a time capital of the State. It ships early vegetables to the Northern markets. Its property is valued at \$1,500,000. The population in 1880 was 6443.

NEWBERRY, JOHN STRONG, geologist, was born at Windsor, Conn., Dec. 22, 1822. Two years later his father removed with his family to Cuyahoga Falls, Ohio. The son graduated at Western Reserve College in 1846, and at Cleveland Medical College in 1848. After spending a year in Europe he began practice at Cleveland in 1851. His strong inclination for natural science led him to become assistant surgeon and geolo-

gist of the U. S. Survey of Northern California and Oregon in 1855. He also joined Lieut. Ives, in 1857, in exploring the Colorado River for 500 miles from its mouth, and in 1859, under Capt. Macomb, he completed the exploration of this river and its branches. During the civil war Dr. Newberry was connected with the U. S. Sanitary Commission, and directed its operations in the Mississippi Valley. In 1866 he was made professor of geology in the School of Mines, Columbia College, N. Y. While still holding this position he was made, in 1869, State geologist of Ohio. Prof. Newberry has been president of the American Association for the Advancement of Science, and is connected with the principal scientific societies of the country. As a geologist and palæontologist he holds a foremost place. His publications include *The Geology, Botany, and Zoölogy of Northern California and Oregon*; *Geology of the Colorado Expedition*; *Geology of the San Juan Expedition*; *Reports of the Geological Survey of Ohio*; *Iron Resources of the United States*, and other works on geology and palæontology.

NEW BRITAIN, a city of Connecticut, in Hartford co., is on the New York and New England Railroad, 102 miles from New York and 8 miles from Hartford, with which it is connected by a branch of New York, New Haven, and Hartford Railroad. It has handsome streets and residences, and two parks, the larger containing 40 acres, and a good supply of water from a reservoir of 175 acres. There are 2 national banks, 1 savings bank, 1 daily and 5 weekly newspapers, 10 churches, and 13 public school-buildings. The high school, State normal school, State armory, Masonic temple, and institute library are fine buildings. The manufactures are builders' hardware, cutlery, hooks and eyes, harness-trimmings, knit-goods, hosiery, etc. Settled in 1634, it was originally part of Farmington, and was incorporated as a city in 1872. In 1880 the population of the city was 11,800, and of the townships 13,979.

NEW BRUNSWICK, a city of New Jersey, county-seat of Middlesex co., is at the head of navigation on the Raritan River, 33 miles S. W. of New York, on the New York division of the Pennsylvania Railroad. It is the terminus of the Delaware and Raritan Canal, which is 75 feet wide and 7 feet deep. Besides the court-house and county buildings, it has a city hospital, orphans' home, a free library, 4 large hotels, an opera-house, a Masonic hall, 2 national banks, a savings bank, a Catholic cathedral, 17 churches, 4 weekly and 3 daily newspapers. It is noted for its educational facilities, being the seat of Rutgers College, which was founded in 1771, and is under the patronage of the Reformed Church. Connected with it is the theological seminary of that denomination, an observatory, and a State agricultural college, with a model farm of 100 acres. The industrial establishments comprise 3 iron-foundries, a brass-foundry, and manufactories of India-rubber, hosiery, paper, shoes, lamps, bronzes, fruit-jars, needles, paper-boxes, carriages, doors, sash and blinds. The town site rises rapidly from the river. It is lighted with gas and electricity, and has water-works. The municipal debt is \$1,516,000, and the annual expenses in recent years exceed \$400,000. The town was settled in 1681, and received its first charter in 1730, but the present charter dates from 1784. The population in 1880 was 17,166.

NEWBURGH, a city of New York, the seat of Orange co., is situated on the W. bank of the Hudson River, 60 miles N. of New York and 83 miles S. of Albany, 41° 20' N. lat. and 74° W. long. In front, for about 8 miles, the river is 1½ mile wide and from 30 to 60 feet deep. This body of water, known as Newburgh Bay, is protected by mountains, which form a semicircle. The city, as it recedes from the river-front, rises in terraces until a height of 300 feet is reached. Here on a plateau are the finest residences, while the whole furnishes an attractive view from the river. The New York Central and the New York and

New England Railroads on the opposite side of the river maintain communication by means of a steam-ferry from Fishkill. The Erie Railroad has two branches terminating in Newburgh, and the New York, West Shore, and Buffalo Railroad passes through the city. The Ontario and Western and the Lehigh and Hudson River bring large amounts of coal to be shipped here. Newburgh has 3 national banks, a savings bank, a hospital, a free library of 16,000 volumes, 24 churches, a high-school, and other public and private schools, 2 daily and 4 weekly newspapers. It is supplied with water from a lake 3 miles distant, has gas and electric light, and a volunteer fire department of 8 companies. The manufactures comprise woollen- and cotton-goods, carpets, agricultural implements, soap, oil-cloth, paints, brushes, plaster, tiles, flour, and beer. There are also foundries, boiler-works, and ship-building-works. Orange county is noted for its extensive dairies and excellent butter. The Orange powder-works are noted for the excellence of their product. Newburgh was noted during the revolutionary war, and at its close the American army was disbanded here June 23, 1783. The old Hasbrouck house, since known as the "Washington Head-quarters," is owned by the State of New York, and is open to visitors. Newburgh was incorporated as a city in 1865. Its property is assessed at about \$9,000,000, and there is a debt of \$350,000. Population in 1870 was 17,014; in 1880 was 17,327.

NEWBURYPORT, a city of Massachusetts, and a shire-town of Essex co., is on the estuary of the Merrimack River, 35 miles N. E. of Boston. It has 4 national and 3 savings banks, 18 churches, a free library, Putnam Free School, a high-school, and other schools. The industrial works comprise an iron-foundry, 6 large cotton-factories, 9 shoe-factories, and manufactories of pumps, carriages, hats, combs, and silverware. There are 1 weekly and 2 daily newspapers published here. Shipbuilding has been long carried on here, and many vessels are owned in the city. Plum Island, which helps to form the harbor, has a hotel. Dummer Academy is in the town of Newbury, from which Newburyport was separated in 1764. The latter was chartered as a city in 1851, and, in 1880, had 13,538 inhabitants.

NEWCOMB, SIMON, astronomer, was born at Wallace, Nova Scotia, March 12, 1835. He removed to the United States at an early age, and while teaching school in Maryland was employed in 1857 as a computer for the *Nautical Almanac*. In 1861 he was appointed professor of mathematics in the navy and stationed at the naval observatory. He superintended the construction and erection of the telescope now used there, which was then the largest in the world. In 1874 he was secretary of the U. S. commission for the observation of the transit of Venus, and he organized the several expeditions then sent out. In 1877 he was made superintendent of the *American Ephemeris and Nautical Almanac*. In 1884 he was also made professor of mathematics and astronomy in Baltimore. His astronomical researches have had reference to the orbits of the asteroids, solar parallax, action of the planets on the sun, etc. The results have been published partly by the Smithsonian Institution and partly in the *Ephemeris*. His *Popular Astronomy* (1878) is an excellent treatise. He has since published textbooks on *Algebra* (1881); *Geometry* (1881), and *Trigonometry* (1882). He has also given much attention to political economy and finance, and has published *A Critical Examination of the Financial Policy during the Southern Rebellion* (1865); *The A B C of Finance* (1877), and many articles in periodicals.

NEW HAMPSHIRE is well known as the "Granite State" from its famous White Mountains. It had by the U. S. census of 1880 a population of 346,991. According to the same authority its land area

is 9005 square miles, thus giving a density of 383.4 per mile.

Finance.—The number of savings banks in New Hampshire in 1886 was 67; the number of depositors was 125,273, an increase of 4037 within a year. The amount of deposits was \$46,631,913, an increase of \$2,804,557. The laws of the State respecting the taxation and supervision of savings banks are unchanged.

The State debt is (approximately) \$2,838,000, and was reduced about \$160,000 in 1887. The debts of the several counties, so far as returned, amounted in 1886 to \$44,086.49; but the assets of the counties, in cash and other property, far exceeded that sum. The total indebtedness of cities and towns (including village precincts) is \$4,171,673.61, a decrease of \$214,467.11 since the preceding year. The total net State and local indebtedness amounts to \$7,009,673, and as the assessed valuation of the State is \$173,658,499, and the population (assuming that it has increased in the same ratio since 1880 as in the decade preceding that date) is 367,000, the entire debt, of every description, amounts to a trifle over 4 per cent. of the taxable property of the State, and to about \$19 per head of the population. The taxes assessed for all purposes in 1886 were \$2,646,526.33, being \$1.52 on each \$100 of taxable property.

Religion and Education.—The Congregational denomination is the most numerous in the State, having 188 churches, and the Presbyterians, affiliating with the Congregationalists, 6 churches. The Congregational ministers number 184, and the Presbyterian 5. The members of both these denominations aggregate 20,749; and there are, connected with the Sabbath-schools as instructors and pupils, 21,660. The Methodists have 125 churches, and 12,879 members. They have 107 pastors in charge of churches, and 76 local preachers. Their Sunday-schools number 136; the officers and teachers of same, 1823; the scholars, 13,739; probationers, 1400. The Baptists have 80 churches, and 8782 members; 75 Sunday-schools; 1111 officers and teachers of same, and 8502 scholars. Their ordained ministers number 82, and licentiates 11. The Free-will Baptists constitute an important sect in New Hampshire, where it took its rise about the year 1780. It now embraces within the State 109 churches, 129 ministers, and 8893 members.

In 1885 the "district system" of common schools, which had prevailed in the State for two generations, was abolished by law and what is known as the "town system" was established in its place. Boards of education, the members of which serve for three years, are now chosen by the towns and have the entire supervision of their schools. They have authority "to provide schools at such places and times as in their judgment shall . . . give all the scholars of the town as nearly equal advantages as may be practicable." There had been complaint that the pupils in the small and remote districts, under the former system, sometimes fared poorly in respect to facilities for instruction, and one chief purpose of the new law was to place all pupils, so far as may be, on the same footing.

The "literary fund," derived from the tax on bank capital and on savings bank deposits of non-residents and divided for the support of schools among the several towns of the State, according to their apportionment of the State tax, amounted in 1886 to \$38,833.21. The whole amount raised for public education was \$617,472.16. The number of schools was 2770, including 526 grade and 57 high-schools. The whole number of scholars enrolled was 64,221, and the number attending private schools, not registered in the public schools, was 5832.

State Institutions.—The State prison is situated in Concord and has 132 inmates. They are employed in the manufacture of bedsteads under a contract. The expenses of the prison exceed the earnings by about \$2500 annually. The Industrial School (formerly State Reform School) is situated in Manchester and is intended for the reformation and instruction of juvenile and female offenders, in which design it has been fairly successful. The number of inmates in 1886 was 112. The Asylum for the Insane has been from its inception growing yearly in extent and value. The number of patients in April, 1886, was 317, of whom nearly three-fifths were females.

Industry.—A new and productive employment has grown up in New Hampshire, to large dimensions, within a few years past. This is the entertainment of "summer visitors," who resort thither for health or pleasure. For this purpose not only all available points on the sixteen miles of sea-coast, but a multitude of airy and commanding positions among the mountains and around the lakes are covered with hotels and boarding-houses, which are kept open between June and October and are thronged during July and August and a part of September. It is, of course, the cool atmosphere and the fine scenery that offer such attractions to visitors, and these fully compensate the inhabitants for their rough and sterile soil. The agriculture of New Hampshire had fallen to a low ebb. In raising cereals she could not compete with the States and Territories of the West, whose easily-grown products were transported to the sea-board at the lowest rate of expense. A small number of farmers in the vicinity of the cities and larger towns could supply the markets with other products which brought in a fair return, but considerable quantities of outland, which had once been cultivated, had been abandoned to weeds and bushes. Now that the summer hotels and boarding-houses have become so numerous, and even hundreds of farmers' houses are filled with boarders, the demand for the products of agriculture is greatly increased and new encouragement is offered for the cultivation of the soil. A market is found at the farmer's door for every esculent that he can raise. The effect of this new industry cannot fail to be widely beneficial to the State, and is already visible in the improved agriculture and general prosperity of the inhabitants of certain localities. No careful estimate has been made of the value of this business, in a year, but it is safe to say that it amounts to millions, and is still increasing, with every prospect of continuing for an indefinite period.

History.—As Belknap's *History* is referred to as especially trustworthy in its account of the early transactions in New Hampshire, it is proper to state that since the last issue of that valuable work, in 1831, several ancient documents have been discovered which throw new light upon some of those transactions. Belknap states that John Mason, the patentee of New Hampshire, sent out at his own charges the first colony which was planted there, at Little Harbor, in 1623. But recently-found evidence indicates that David Thomson, the leading man of that colony, had himself obtained a grant of land and brought out the colonists at the expense of three merchants of Plymouth in England, and though it is probable that Mason was cognizant of the grant and adventure, yet that he expended no money in settling his American grants until six or seven years later. Belknap, and most other historians, represent that Mason's patents gave him simply the ownership of the soil and no authority to set up a government upon it. But in April, 1887, a copy of a patent was unearthed, purporting to have been issued by King Charles I., of England, to John Mason, dated in 1635, and confirming to him and his heirs the territory of New Hampshire, and adding thereto the power of government. The existence of this royal grant had

been asserted early in the last century, but was doubted, mainly on the ground that no action was known to have been taken or attempted under it. New Hampshire is doing much for the preservation of the materials of her early history. There have been already published fifteen volumes of her MS. records, eight of province and State papers, four of town papers and three of revolutionary records, and more are to follow. The Legislature has also made appropriation to procure copies of the documents in the British archives illustrative of her early history. (C. H. B.)

NEW HAVEN, the largest city of Connecticut and county-seat of New Haven co., is See Vol. XVII. on a sandy plain at the head of New p. 394 (p. 403 Am. Rep.) Haven harbor, into which the small rivers Quinnipiac, Mill, and West flow. It is 74 miles N. E. of New York, on the New York, New Haven, and Hartford, and the Shore Line. There are three railroads to Boston and three other railroads. Across the rivers are several bridges, the largest being that over the Quinnipiac near its mouth. The city is now co-extensive with the original "town," but each has its own administration. On the public green of 16 acres, in the centre of the city, stands the building used as a state-house down to 1873, while New Haven was, jointly with Hartford, the capital of the State. Opposite the green is the city-hall, an imposing structure, the county court-house, the U. S. government building, and various churches. Other important buildings are those of Yale College (*q. v.*) and the Sheffield Scientific School, the hospital, two orphans' asylums, the public high-school, and the Hopkins Grammar School. There are altogether 34 schools, 61 churches, 7 national banks, 3 savings banks, and 3 other banks. Seven daily and 10 weekly newspapers are published here. Of the more important publications *Silliman's Journal of Science* is famous in its department, and the *New Englander* is of high repute as a literary periodical.

New Haven is largely engaged in manufacturing. According to the U. S. Census of 1880 it had altogether 587 manufacturing establishments, with a capital of \$9,793,737, employing 15,156 hands, and producing to the value of \$24,040,225 yearly. The chief products are hardware, wire, locks, clocks, corsets, carriages, guns, pistols, rubber goods, paper, matches, furniture. The harbor is shallow, yet a large coasting trade is carried on, especially in coal and iron, but the foreign trade, formerly extensive, has been transferred in great measure to New York city. Long Wharf is 3480 feet in length; the U. S. government has constructed a breakwater surmounted by a lighthouse. A jetty has been built at the entrance of the harbor. New Haven is finely laid out, and the streets are beautifully shaded with elms and other trees. It is bounded on the north by two ranges of hills, terminating in the East and West Rocks, which present precipitous faces towards the city. Besides the public green it has ten small parks or squares, the Yale College Athletic grounds, and a private park. On the border of the town is the picturesque East Rock Park, containing 350 acres, which has been improved partly by the liberal gifts of private citizens. On the highest part of the rock stands a soldiers' monument, 125 feet high. The city is lighted with gas and well supplied with water. The assessed valuation of city property is \$50,000,000, the public debt of town and city is about \$1,500,000, and the yearly expenses about \$950,000.

New Haven was settled in 1638 by wealthy London merchants, who desired to found a colony to be governed by Bible laws. This colony was united in 1662 to that of Connecticut, but New Haven was recognized as a capital of the State until 1874. It was incorporated as a city in 1784. Its population in 1880 was 62,882, but as the city bounds have since been enlarged it now exceeds 77,000.

NEW JERSEY by the U. S. census of 1880 had 1,131,116 inhabitants, and thus ranked as the nineteenth State. In 1887 there were reported 374,011 children between 5 and 18 years of age; of these 224,109 were enrolled at schools, but the schools had actually accommodations for 200,000 only.

For this reason the compulsory educational act of 1885 cannot be enforced. There were 825 male teachers with an average monthly salary of \$64, and 3177 female teachers with average salary of \$41. The State Normal School had a total enrolment of 239, with an average attendance of 206. The school fund in 1888 was

reported at \$2,267,455; in addition to which there are riparian leases (for lands now under water) valued at \$1,009,759, and an agricultural college fund of \$116,000 (see **RUTGERS COLLEGE**). The income from the school fund for 1888 was \$275,512. Besides this there were school taxes amounting to \$1,511,820, of which \$1,465,268 were expended.

The State Insane asylum at Morristown had 1073 patients for the year 1887, of whom 873 remained at the close. The asylum at Trenton had 865 patients for the year, 707 remaining at the close. The expense of these asylums in 1888 was \$165,328.45. The expense of the county lunatic asylums for that year was \$78,742. The State supported 89 feeble-minded children in 1887, mostly at Elwyn, Pa., at an expense of \$23,492, but in 1888 an asylum was opened at Vineland, N. J., for this class. The State school for the deaf has over 100 scholars. Provision is made for the blind at asylums in New York city and Philadelphia, there being 31 at the former and 10 at the latter, for whom the State appropriated \$14,689.

The State Soldiers' Home has 328 inmates, the total since its establishment being 14,725. Its receipts for 1888 were \$33,814, and its expenditures \$33,593. In 1887 the Legislature appropriated \$125,000 for a home for disabled soldiers at Kearny, on the Passaic River. The cost of this home was reported at the end of 1888 to be \$113,305.55. The militia of the State comprises 53 companies of infantry, forming 7 regiments, 2 Gatling gun companies and 1 of sea-coast artillery. They have altogether 306 officers and 3693 men. A camp for practice has been formed at Sea Girt, containing 119 acres. The annual expenditure for militia in 1888 was \$114,968.

The State prison contained in 1888 a total of 1380 prisoners, the average number being 877, of whom 857 were males. The receipts for the year were \$65,617 and the expenses \$162,859. Since 1885 the prisoners have been employed on piece-work. This system has not proved so economical as that of hiring out the labor by contract, the State having now the responsibility for both quality and quantity of work. The governor has recommended the imposing of indeterminate sentences (see **PRISON DISCIPLINE**). The Reform School at Jamesburg had 441 inmates during the year, there being 269 at the close. The State Industrial School for Girls had 67 inmates.

In 1884 the Legislature passed an act to compel all corporations to pay on real estate the same tax as individuals, the rate being limited to 1 per cent., and the main stem of railroads and the waterway of canals being exempted. Taxes were also allowed to be assessed on the real estate of railroads and canals for local purposes. The corporations resisting, the courts decided most of the provisions of the act to be constitutional. Under this act the State revenue derived from railroads increased from \$717,562 in 1884 to \$1,075,000 in 1886, besides local taxation amounting to \$372,364. There were altogether 97 railroad and

canal companies, whose property was valued at \$192,980,343.

On Nov. 1, 1888, the receipts of the State fund for the year were reported at \$1,504,124, and the State held stocks, bonds, and other securities to the amount of \$1,027,487. The amount of outstanding loan on the State war-bonds was \$1,169,300.

In 1886 a State Board of Health and Bureau of Vital Statistics was formed, and local boards of health were required to be formed in each city and township. A State Board of Agriculture was also established.

Considerable interest attaches to the recent movements looking toward the settlement and cultivation of the great tracts of waste and sandy plain land which cover nearly one-third of the State's area, principally towards the south-east. The natural features of this plain are much as follows: The surface has not generally a dead level, but is for the most part marked by a succession of low ridges of sand running parallel to the coast, and presenting much the appearance of old, yet not very old, sea-beaches. The whole region is well supplied with flowing streams; and its lower depressions are generally swampy. The swamps are generally overgrown with the white cedar (*Cupressus thyoides*), which affords valuable timber, and after being cleared the swamp-lands are often profitably utilized in the culture of cranberries. Some of the swamps are underlaid with well-preserved stores of timber from coniferous trees. The extraction and working of this long-buried supply of sound and still very useful wood form an important industry at certain places (as at Dennisville). Another industry of this region was formerly the extraction and working of the abundant, but somewhat uncertain, supply of bog iron-ores or limonites. These ores, though poor in iron, are easily smelted and make excellent castings. The once numerous iron-works of this region were all abandoned on account of the failure of the local supply of charcoal, due to the cutting of the main part of the forest growth. The ores, however, when worked out locally are reputed to have the quality of self-restoration, due largely to the growth in them of those species of diatoms which incorporate in their siliceous frustules a large percentage of iron, which they extract from the waters which flow into the ore-beds. The abundance and tractability of these ores, and the excellent finish assumed by the castings made from them, may yet restore to the old workings some of their former value. There are locally found good supplies of peat, which is a useful fertilizer and may yet become valuable as fuel. Certain of the peaty deposits are reputed to make excellent brown mineral paints, presumably those which combine iron with their peaty constituents. At many points the sand of this region is extensively utilized in the manufactures of glass-ware. There are large supplies of a dark and coarse brown sand-stone which is extensively used for foundations and occasionally for general building purposes. This stone is easily wrought and becomes very hard on exposure to the weather. Several navigable streams penetrate the region, and there are not a few good water-powers already developed. The old stock of pine belonged chiefly to the dwarfish Jersey or scrub-pine (*Pinus inops*); comparatively little of it is now found, since the charcoal-burners have made great havoc with it, and the largest trees have for many years been cut and sawed into a coarse and strong description of lumber. Great forest-fires prevail almost every spring and summer; and the suppression of these is the first requisite to the restoration of the old woodland growth.

The soil of the so-called "pines" of New Jersey is for the most part far better than a stranger would suppose from its appearance. There are large tracts which are sparsely settled, yet which are naturally good grass-lands and are capable of supporting a large agricultural population. Still, as a rule, considerable

skill is required to manage these light lands profitably. The Vineland tract, centring in the town of the same name, has been the most noted and in some ways the most successful of the attempts at colonizing the waste lands of this State. The Hammonton colony affords another instructive example of what thrift and intelligence can do with unpromising materials. The town of Lakewood, in the extreme north-east of the comparatively unsettled region of the State, has become noted as a health-resort, and is especially frequented in winter. The principal element among the settlers in the best known of the recent colonies in this section is made up of native Americans, chiefly from New England and the State of New York. Egg Harbor City is a German colony, where the making of light wines is a specialty. Near Estellville and at Alliance, near Vineland, are experimental colonies of expatriated Russian Jews, driven to this country by the anti-semitic movements in their native land. The principal crops of this region are the small fruits—grapes, blackberries, raspberries, strawberries, cranberries, with potatoes, sweet-potatoes, and other hoed crops, and the garden vegetables. Rye does extremely well in some parts. Dr. J. E. Garretson, in his *Brushland* (1882), gives interesting notes of the creation of a profitable farm in this region out of a tract which, though of very unpromising appearance, must have contained in itself to an unusual degree the elements needed to foster success in any agricultural enterprise. The region above discussed is for the most part bounded landwards by very fertile light lands; and in some parts the line of demarcation is very plain and unmistakable between smiling fertile grass-lands and fields of sand covered with a relatively scanty herbage. It is noteworthy, however, that the unfertile region is singularly rich in plant-species, it being the habitat of many Southern forms which nowhere else occur so far to the northward. This region is traversed by nearly all the lines of railway which reach the many seaside resorts of New Jersey. There are other parts of the State which are quite as unpromising in an agricultural point of view as this. The extensive clay-region in the central portion of the State, so important for its terra-cotta, its fine pottery, and its excellent fire-brick, is in part almost inarable.

The *seaside resorts* of New Jersey are very numerous and important. Almost from Sandy Hook to Cape May its sea-bathing places form a nearly continuous succession of towns and villages, of which there are more than 50 in 100 miles of coast. South of Sandy Hook the coast is everywhere sandy. The beach in Monmouth county is generally elevated and even bluff, and is backed by a fertile region; southward the New Jersey coast is much lower and is made up chiefly of a succession of sand-spits and low islands which shield from the open sea a succession of shallow bays, much resorted to by sportsmen for game-birds and fish. The more southern bathing-places are generally safer, having a more shelving beach with but little undertow. The largest of the seaside resorts are Long Branch, Asbury Park, Ocean Grove, Atlantic City, and Cape May City.

The old boards of the proprietors of East Jersey and West Jersey still exist, the former having its head-quarters at Perth Amboy and the latter at Burlington, but both long ago surrendered all except their proprietary rights. The East Jersey proprietors have latterly laid claim to large tracts of unoccupied lands over which other parties have in some cases exercised the rights of ownership for 200 years, on the ground that no transfer of title is now on record. This has led to costly litigation, and has strengthened a movement to have the old proprietary rights finally adjudicated, thus terminating all disputes as to claims founded upon any defect of the registration of title-deeds during the colonial period.

(c. w. g.)

NEW JERSEY, COLLEGE OF. This institution of learning, commonly called Princeton College, was founded in 1746. Like all our early colleges it was primarily established to raise up an educated ministry, "to be a seminary of true religion and sound learning," especially for the Presbyterian Church. Prominent ministers and laymen of the Presbytery of New York, which then included a large part of New Jersey, after various ineffectual efforts, succeeded in obtaining a charter. The only record of this charter is in Book C., p. 137, of the Colonial Commissions and Charters, and is as follows: "Mem. of a Charter for a Colledge. A charter to incorporate sundry persons to found a colledge passed the great seal of this province of New Jersey, tested by John Hamilton, Esq., president of His Majesty's council and commander-in-chief of the province of New Jersey, the 22d day of October, 1746." This charter was never recorded, but under it the Rev. Jonathan Dickinson, pastor of the Presbyterian Church in Elizabethtown, N. J., where he also had a flourishing academy, was appointed president and the college was established at Elizabethtown, the first session beginning in the fourth week of May, 1747.

President Dickinson died Oct. 7, 1747, and the students, about twenty in number, were placed under the care of the Rev. Aaron Burr, pastor of the Presbyterian Church in Newark, to which place the institution was now removed. An enlarged and more liberal charter was granted by his Excellency, Jonathan Belcher, Esq., the Governor of New Jersey, to which the "Great Seal of the Province of New Jersey" was affixed Sept. 13 and the charter was issued Sept. 14, 1748. The trustees named in it, who with two exceptions were Presbyterians, accepted the charter in a meeting held at New Brunswick, N. J., Oct. 13, 1748. At Newark, Gov. Belcher presiding, the trustees unanimously elected the Rev. Aaron Burr president, Nov. 9, 1748. His inauguration took place upon the same day, and at a later hour the first commencement was held. Of the six members of the first class five became ministers of the gospel. The sixth was Richard Stockton, one of the signers of the Declaration of Independence. The first honorary degree was that of A. M., conferred upon Gov. Belcher.

Liberal subscriptions were obtained, but the contributions were wholly inadequate to the execution of the designs of the trustees. Rev. Samuel Davies and Rev. Gilbert Tennent were sent to Great Britain and Ireland to solicit additional benefactions. Their mission was very successful, many hundreds of pounds having been contributed by persons of different denominations and in various walks of life. The General Assembly of the Church of Scotland even ordered a national collection, and among the contributors were the Bishop of Durham and a descendant of Oliver Cromwell.

The second commencement had been held at New Brunswick on the last Wednesday of September, 1749, but for the next seven years "the academical exercises were generally performed in the county courthouse" at Newark. The funds obtained by Messrs. Davies and Tennent were devoted to the erection of a college edifice. As the site of this "the little village of Princeton was fixed upon as the most convenient situation, being near the center of the colony on the public road between *New York* and *Philadelphia*, and not inferior in the salubrity of its air to any village upon the continent."

The people of Princeton made liberal contributions in land and money, "200 acres of woodland, 10 acres of cleared land, and one thousand pounds proc. money (\$2400)." By suggestion of Gov. Belcher "the edifice sacred to liberty and revolution principles," which was erected at Princeton, 1754-57, was named *Nassau Hall*, in honor of King William III., "a branch of the illustrious House of Nassau." Hence the institution itself is often called Nassau Hall. This building, 176

feet long and 54 wide, with slight central projections in front and rear, was the largest edifice in the colonies at the time of its erection. It was three stories high with a basement, and was surmounted by a cupola. It contained sixty rooms for all purposes, public and private, chapel, library, recitation-rooms, dining-room, and chambers, of which there were 49 to accommodate 147 students. It was constructed of stone, and the president's house in the vicinity was of brick. Although burned down in 1802 and again in 1855, its main walls still stand, and, except for the unsightly towers at the ends, it presents substantially its original appearance.

The curriculum of studies was equal to that of any of its sister colleges, consisting of Latin, both written and spoken, Greek, to be translated into both Latin and English, French, Hebrew, geography, algebra, geometry, navigation and astronomy, natural philosophy, ontology, logic, rhetoric, and ethics, together with theology for those who intended to become ministers of the gospel. The president, assisted by two tutors and an occasional lecturer, was expected to give instruction in all these branches in addition to his regular services as a minister. So varied were the accomplishments of President Burr, as had been those of President Dickinson, that he was equal to the work.

When the college was removed to Princeton in 1756 there were about 70 students, and the number increased rapidly. Gov. Belcher died Aug. 31, 1757. President Burr prepared and preached the funeral sermon while very unwell himself. Prostrated by his great labors, he never rallied, but died Sept. 24, 1757, just two days before the commencement.

Rev. Jonathan Edwards, perhaps the greatest mind this country has produced, was elected to succeed Mr. Burr, his son-in-law. Inaugurated Feb. 16, 1758, he had just entered upon his work when he died of inoculation, March 22, 1758. Thus the prospects of Nassau Hall appeared darker than before.

After a vacancy of eighteen months Rev. Samuel Davies was chosen president, entered upon his duties July 26, 1759, and was inaugurated Sept. 26, 1759. But the bright hopes he had excited were doomed to disappointment; for on Feb. 4, 1761, "this brilliant genius, in the midst of his rising reputation and growing usefulness, suddenly resigned his breath, to the inconsolable grief of the whole society and universal lamentation of all good men."

Rev. Dr. Samuel Finley was now elected president, entered upon his duties in July, 1761, and was inaugurated Sept. 30, 1761. The college rapidly increased in numbers, and was flourishing in all respects. The classes of 1765-66 each contained 31 students. Again were expectations bitterly disappointed. A peculiar fatality seemed to attend the office of president. Dr. Finley died July 17, 1766. Thus within the space of twenty years the college had been called to mourn the loss of five presidents—Dickinson, Burr, Edwards, Davies, Finley—an array of the most eminent ministers our country had yet produced.

The college had graduated nearly 300 students and had obtained considerable reputation on both sides of the Atlantic. The Rev. Dr. John Witherspoon, of Scotland, was now elected president, but at first declined, and the Rev. Samuel Blair, an alumnus of high promise, was chosen in his place. He magnanimously declined when he learned that Dr. Witherspoon would accept the appointment if again offered. This was done, and Dr. Witherspoon began his long and successful administration, Aug. 17, 1768. Strenuous had been the efforts made to increase the inadequate funds by subscriptions, lotteries, and in other ways. Yet in 1767 the college had only £2815 in proclamation money (\$7500). Gov. Belcher had left 474 volumes to the library, which in 1764 had been increased to 1200. Dr. Witherspoon obtained large gifts for it from his friends in Great Britain, and subscriptions were made in the colonies from Massachusetts to Georgia, so

that nearly £8000 were collected by 1775, of which the Phillips family in Boston gave £500. Mr. John Williamson, of Virginia, had given £100 sterling to found a professorship of theology, to which Rev. John Blair was elected in 1767. This was the first chair endowed, but owing to the inadequacy of the funds he resigned in 1769 and Dr. Witherspoon discharged these duties in addition to his many others. He was assisted by three tutors. In 1771 Wm. C. Houston was appointed professor of mathematics and natural philosophy. In 1779 the Rev. Samuel Stanhope Smith was made professor of moral philosophy and subsequently of theology.

Dr. Witherspoon was very active and energetic, and extended the course of study. The number of students, which had fallen off directly after Dr. Finley's death, now began to increase, and from this time until the outbreak of the revolution in 1775 the average of the classes graduated was 22. The exercises of the college were greatly interrupted by the war and no commencement was held from 1775 to 1779, although the examinations took place and the degrees were conferred by the trustees as soon after as a quorum of that body could meet. Dr. Witherspoon was a member of the Continental Congress from 1775 to 1782, and along with Richard Stockton and Benjamin Rush, alumni of the college, signed the Declaration of Independence. Nassau Hall was occupied as a barrack and a hospital by both the British and American troops from 1776 to 1781. It still bears the mark of a cannon-ball fired in the battle of Princeton, Jan. 3, 1777. Another ball destroyed the portrait of George II., a present from Gov. Belcher, which hung in the chapel, now a part of the geological museum.

The Continental Congress met in the library in the second story of Nassau Hall in 1783, and the army lay at Rocky Hill, a short distance from Princeton. Congress was present at the celebration of the Fourth of July by the American Whig and Closophic Societies, the two literary societies of the college. Not only the Congress but the ambassadors of France and Holland and Gen. Washington himself were present at the commencement in September, 1783, when Ashbel Green, the valedictorian, afterwards president of the college, paid a handsome compliment in his address to the Father of his Country. The trustees requested Washington to sit for his portrait, to which he consented. It was painted by Charles W. Peale, and is an admirable likeness of Washington as he looked at that time. In the picture is also a portrait of Gen. Mercer, who was mortally wounded at the battle of Princeton, which is represented in the background. The picture occupies the frame which formerly contained the portrait of George II. Washington, through President Witherspoon, presented 50 guineas to the trustees as a "testimony of his respect for the college."

From Nassau Hall the Continental Congress sent forth its Proclamation of Peace and Thanksgiving in 1783, and Washington dated his Farewell Address to the Army at Princeton.

The college had suffered in all respects from the war; its buildings were devastated, its funds impaired, and its numbers reduced. In 1782 there were only 40 students and 11 graduates, the average number of graduates having been only six for the previous five years. By dint of great effort the buildings were repaired and funds were obtained to pay the salaries. Dr. Smith had conducted the college while Dr. Witherspoon was attending Congress, and was the vice-president during the close of his administration, which was the longest and most arduous in the history of the institution. Dr. Witherspoon had done a great work despite the ravages of war, yet at his death, in 1794, the number of the students and the resources of the college were no greater than they had been at the beginning of his administration in 1768, but it was gradually regaining its old position. Under him 454 students were graduated, 313 under his predecessors.

Dr. Smith now became president, and with such professors as Dr. Walter Minto, a distinguished mathematician, and Dr. John Maclean, who introduced the "new chemistry" into this country, and at that time had few equals in his special branches of study, a career of prosperity seemed to be opening for the institution. But again was the prospect blighted, for on March 6, 1802, Nassau Hall was destroyed by fire. Friends soon rallied around her. Dr. Smith and others visited the Middle and Southern States and succeeded in collecting funds sufficient to rebuild Nassau Hall, and to erect two other buildings for recitation and lecture-rooms, library, and refectory.

In consequence of impaired health Dr. Smith resigned in 1812. His administration was very successful and his influence upon the students remarkable. There was trouble at times, but the number of students increased and about 30 were graduated annually, 534 in the 18 years of his administration.

He was succeeded by the Rev. Dr. Ashbel Green, an active trustee and very prominent in the Presbyterian Church. Some of the old troubles remained and were increased, but they finally disappeared and the prosperity of the college under him is shown by the large increase of students. He did much for their religious instruction, and in 1815 occurred a most remarkable revival of religion. Under his administration 356 students were graduated, about 36 annually.

He resigned in 1822 and was succeeded in 1823 by the Rev. Dr. James Carnahan, an excellent scholar and administrator. From various causes there was a diminution in the number of students in 1828-29, and several of the professors resigned. Prof. John Maclean, a man of remarkable energy and executive ability, alone remained. Chiefly through his efforts and with the hearty co-operation of the president a new faculty of remarkable ability was formed, which gave great reputation to the college. In it were Profs. Henry, Torrey, Vethake, Dod, J. A. and J. W. Alexander, Jaeger, Hart, and S. Alexander. The policy of enlargement proved to be a wise one, the number of students increased and new buildings were added, notably East and West Colleges, Whig and Clio Halls, and finally a new chapel. Dr. Carnahan's administration, beginning inauspiciously, was the longest and most successful in the history of the college hitherto. When he resigned in 1854 the faculty, the number of students and of the college buildings had been doubled, and an endowment had been begun in the form of scholarships.

Rev. Dr. John Maclean, who had been the vice-president for 25 years, was now elected president. He began his administration by at once enlarging the faculty, bringing in such eminent men as Profs. Atwater and Guyot, and promoting the younger men, extending the curriculum, and increasing the endowment. The college again sustained a most serious loss. Nassau Hall was destroyed by fire for the second time, March 10, 1855. The insurance and contributions of friends defrayed one-half of the cost of its restoration, the other half was derived from the income of the college. The original walls still remain, and the noble building still stands almost substantially as of old.

The college contained the largest number of students (317) in its history when the rebellion broke out in 1861. It had always had a large number of students from the South. After the firing upon Fort Sumter 90 students left in a body to return home. No college in the North probably felt the effects of the war more severely than Princeton. Of her alumni and students 150 entered the Union army and a large number of course were found in the Confederate ranks. The number of students was reduced to 221, and the income of the college was greatly diminished. Appeals were made to friends and the result was large contributions from Mr. James Lenox and his sisters, Mr. John I. Blair, Mr. John C. Green, and many others. Dr. Atwater was especially active in obtaining an endowment. Legacies were received from Mr. Silas Holmes,

Dr. John Woodhull, and Prof. George M. Giger, and were promised by others. The college was placed on a firm basis, the salaries were increased, and the number of students in 1867 was 264; in that year it received 117 new students, the largest accession in its history. In the same year the corner-stone of the fine observatory was laid. This building, the gift of Gen. N. Norris Halstead, cost \$50,000. Mr. John C. Green also gave \$100,000, the beginning of his munificence to the college.

After faithful service for 50 years Dr. Maclean determined to resign. The destruction of Nassau Hall and the civil war had been severe blows, but the college was now stronger and more prosperous than ever. Nearly \$500,000 had been received under his administration, a sum larger than the receipts during all the previous history of the college.

As his successor the trustees selected one of the ablest philosophers of the present age. Dr. Witherspoon had been chosen in 1768; the Rev. Dr. James McCosh, another Scotchman, was chosen in 1868. As history thus repeated itself at the end of a century in this election the old régime passed away and a new era began. The new president entered upon his work with the greatest energy, which was crowned with remarkable success in all respects. New friends presented themselves, liberal gifts were made, beautiful and needed buildings were erected, new studies were introduced into the curriculum, and the faculty was much enlarged. Mr. John C. Green founded the School of Science, erected the building, furnished it with apparatus, and endowed its various chairs. He also erected Dickinson Hall and the Chancellor Green Library. After his death the trustees of his estate erected Witherspoon Hall, Edwards Hall, the small observatory, and made other large contributions. Probably \$1,500,000 were thus contributed from this one source.

Mr. William Libbey erected and furnished University Hall at an expense of \$200,000, and gave the E. M. Museum of Geology so admirably arranged by Prof. Arnold Guyot. Messrs. H. G. Marquand and Robert Bonner erected a fine gymnasium. Mr. Marquand also erected a beautiful chapel, costing \$125,000, and from his brother's estate came \$60,000 to found a School of Art, while other friends of the college contributed \$42,000 to erect an art-building destined to receive the splendid ceramic collection of Dr. William C. Prime. Messrs. R. L. and A. Stuart presented the elegant president's house and grounds, and Mrs. R. L. Stuart gave \$154,000 to found the School of Philosophy. Mrs. E. Stevens and the Rev. S. B. Dod endowed the chair of mathematics in memory of their father, and Mr. J. S. Kennedy endowed the chair of Latin. Murray Hall, for the meetings of the Philadelphia Society, a religious society among the students, was a legacy from a young graduate, Hamilton Murray, who perished in the steamship Ville du Havre. Fellowships, scholarships, and prizes were founded and numerous other donations were made. At least \$3,000,000 have been contributed to the college under the administration of Dr. McCosh.

Not only was the curriculum of study enlarged, but a wise system of elective studies was introduced, carefully guarded so as not to lower the standard of education. Post-graduate courses leading to higher degrees through examination were introduced, thus contemplating ultimately a university.

The faculty has been enlarged from 16 members to 40, and the number of students, including post-graduates, has more than doubled, rising from 264 to 604.

This has been the most brilliant and successful administration in the history of the college, and after 20 years of arduous service Dr. McCosh has retired with the admiration and gratitude of all the friends and alumni of Princeton.

While the College of New Jersey has never been under ecclesiastical control yet nearly all its trustees and professors have always been Presbyterians, while

"equal liberties and privileges are secured to every denomination of Christians. It has ever been 'a seminary of true religion and sound learning.' Daily public worship is obligatory, and the Bible and the evidences of Christianity constitute important parts of its curriculum.

The whole number of its graduates is about 6200. Of this number 1250 have become ministers of the gospel, 400 physicians, and a large number entered the legal profession. About 400 have held high civil office and 250 have become professors. Space forbids the enumeration of those who have held conspicuous positions from James Madison, the fourth President of the United States, down through almost every other honorable office in the National and State governments.

At the last commencement of the college, June 20, 1888, under the most auspicious circumstances, the Rev. Dr. Francis L. Patton was inaugurated the twelfth president of the college. (H. C. C.)

NEW LONDON, a city of Connecticut, and half-shire town of New London co., is on the W. bank of the Thames River, three miles above Long Island Sound, in 41° 22' N. lat., and 72° 91' W. long. The harbor, averaging thirty feet deep, is one of the best in the United States. The city is built on a declivity partly occupied by granite rocks. Railroads connect it with New York, 126 miles distant, and there is also daily steamboat communication. The New London Northern Railroad has here a granite wharf, 1125 feet long. The city has a court-house, a granite custom-house, brownstone city-hall, 5 national banks, 2 savings banks, 12 churches, a high-school and other schools, a daily and a weekly newspaper. The manufactures include woollen goods, cotton-gins, agricultural machines, hardware, and sewing-silk. Fruit-canning and cracker-baking are also carried on. The inhabitants were formerly interested in the whale-fishery, and now in the seal and other fisheries. The U. S. navy-yard is on the E. side of the Thames, above the city. Forts Trumbull and Griswold were built for the defence of the city, but are not effective now. New London was settled in 1645, though not so named until 1658. During the revolution many privateers were fitted out here, and Benedict Arnold captured and burnt it in 1781. In the war of 1812 Decatur was long blockaded in this harbor. The vicinity has now become a popular summer resort. The population of New London in 1880 was 10,537.

NEWMAN, EDWARD (1801-1876), an English naturalist, was born at Hampstead, May 13, 1801. He was a member of the Society of Friends, which his ancestors had joined at the time of its rise. He became a printer in London, but his strong love of natural history led him to devote much time to its study. In 1833 he founded the *Entomological Magazine*, which was merged in the *Entomologist* in 1840. He also established the *Zoologist* in 1843, and to other periodicals he was also a frequent contributor on his favorite subjects. Among his works are *History of British Ferns* (1840); *Introduction to the History of Insects* (1841); *Insect-Hunters* (1858); *Birds-nesting* (1861); *Dictionary of British Birds* (1866); *British Moths* (1869); and *British Butterflies* (1871). He died June 12, 1876.

NEWMAN, FRANCIS WILLIAM, an English author, was born at London, June 27, 1805, being a younger brother of Cardinal Newman. Educated at Ealing School and at Worcester College, Oxford, he graduated in 1826 as a double first-class. He was fellow of Balliol until 1830, when he resigned, because unable conscientiously to sign the Thirty-nine Articles for the Master's degree. He had been trained as an Evangelical, but gradually diverging in an opposite direction to that which his brother had taken, he became a rationalist and eventually simply a deist. His change of views is set forth in his *Phases of Faith* (1850), with which may be compared his previous work, *The Soul, its Sor-*

rows and Aspirations (1849), and a later one on *Theism, Doctrinal and Practical* (1858). After leaving Oxford he spent three years in travel in the East, and on his return became classical tutor in Bristol College. He held a similar position in Manchester New College, 1840-46, and was afterwards professor of Latin in University College until 1863. Among his numerous publications are *History of the Hebrew Monarchy* (1847); *Contrasts of Ancient and Modern History* (1847); *Regal Rome* (1852); *English Institutions and their Reform* (1865); *Miscellanies, Academical and Historical* (1869); *Europe of the Near Future* (1871). He also translated the *Odes of Horace* and the *Iliad* of Homer in unrhymed metre, the choice of which he defended in a subsequent treatise on Homeric translation. Among his philological works are essays on the languages of ancient Italy, a hand-book of modern Arabic, and an English-Arabic dictionary. Other publications were discussions of public events and social questions of the time.

NEWMAN, JOHN HENRY, Cardinal, was born in London, Feb. 21, 1801. The son of a banker, he was educated at Ealing School. His marked religious temperament led him at first to accept the views of the Evangelical school, whose spirituality had been quickened by the Methodist movement. Having entered Trinity College, Oxford, he graduated in 1820, and soon came in contact with Dr. (afterwards Archbishop) Whately, who, as Newman says, "opened my mind and taught me to think and to use my reason." Whately, when made principal of St. Alban's Hall in 1825, showed his esteem for Newman by appointing him vice-principal. But the place was given up in the next year, when he was elected fellow of Oriel College. In 1828 he was made incumbent of the Church of St. Mary the Virgin, at Oxford. Through Hurrell Froude he formed a friendship with Keble, who had published his *Christian Year* in 1827. Having parted from the Evangelicals, Newman turned to the study of the Church Fathers. His first literary work was *The Arians of the Fourth Century* (1833), a history which grew out of a call to write an account of the Council of Niceæ. His health being impaired by the labor, he made a visit to the shores of the Mediterranean, and during his stay in Rome called on Rev. Dr. (afterwards Cardinal) Wiseman. When he returned the Oxford movement had been inaugurated by Keble's sermon on "National Apostasy." Newman at once began the publication of the *Tracts for the Times*, to set forth what he maintained as Anglican doctrine, and to establish its historical basis. In a few months Rev. Dr. E. B. Pusey (see *ENCYCLOPEDIA BRITANNICA*) joined in the new movement, and his ability, learning, and social prominence gave it such a powerful impulse that it received his name. He, as well as others, contributed to the *Tracts*, whose publication extended over seven years, yet Newman remained the chief author and responsible editor. Following Pusey's advice and example, he engaged also in the preparation of more elaborate works, the first of which was *The Prophetic Office of the Church, Viewed Relatively to Romanism and Popular Protestantism* (1836). The Church of England was held to be identical throughout its history and to furnish in modern times the safe *Via Media*. Next appeared his *Essay on Justification* (1837), in which he controverted Luther's fundamental doctrine of justification by faith alone. In his *University Sermons* the Church was exhibited as a divine institution, "the source of all spiritual power and jurisdiction and the channel of all grace." From 1838 to 1841 Newman was also editor of the *British Critic*, a monthly magazine which upheld these views, though not to the exclusion of other topics. In 1838 Bishop Bagot, of Oxford, in his charge made some animadversions on the *Tracts*, whose Romeward tendency was now plain. Newman at once offered to stop them, but was not then required to do so. At last, in 1841, *Tract No. 90* explained the Thirty-nine Articles so as to remove all

opposition to characteristic Roman doctrine. At this definite conclusion a violent outcry arose. The University authorities condemned the *Tract*. Newman refused to withdraw it, but he discontinued the series, and even consented to refrain from defending the *Tracts*, though many bishops now directed charges against them and the movement they represented. An ecclesiastico-political event, however, induced Newman to break his silence. In 1841 the British government joined with the Prussian in establishing a bishopric at Jerusalem. The scheme had originated with Chevalier Bunsen, who hoped that the unity of Protestantism would thereby be exhibited and promoted. Newman protested openly against the countenance thus given to Lutheranism. In September, 1843, finding he could no longer hold an official position in the English Church, he resigned his charge of St. Mary's and retired to Littlemore, where he had formed a kind of convent. Having lost faith in the catholicity of the Church of England, he formally retracted his earlier attacks on the Church of Rome. For two years he and his associates busied themselves with translations from Athanasius and with writing *Lives of the English Saints*. In 1845, as a chart of the direction of his thoughts, he drew up his *Essay on the Development of Doctrine*; but before it was finished he was received into the Roman Catholic Church (October 9). In the following February he left Littlemore, going first to Oscott, and thence to Rome. Here he was ordained priest, and on returning to England, in 1848, he became head of the Oratory of St. Philip Neri, at Birmingham. The Oratory was afterwards transferred to Edgbaston, where a convent, church, and schools were erected. Besides his labors in conducting the affairs of this order, Father Newman was busy in lecturing and preparing works for publication. Among these were his *Sermons to Mixed Congregations* (1849); *Lectures on Difficulties Felt by Anglicans in Submitting to the Catholic Church* (1850); and two religious novels, *Loss and Gain* (1848), and *Callista* (1856). In 1854 Dr. Newman was appointed rector of the newly founded Catholic University of Dublin, in which he delivered several courses of lectures. Though he seemed eminently fitted for this position by his gifts of mind and character, the institution did not achieve the success that was anticipated. After four years, devoted to organizing and conducting the university, he returned to his former work in the Oratory. The Roman Catholic Church in England owes to him a change in its attitude. Among its members he promoted some freedom of opinion, and diminished the alien proclivities which had formerly characterized them. In 1864 Rev. Charles Kingsley provoked a noted controversy by charging Dr. Newman, in common with other Catholics, with depreciating veracity as a virtue of the natural order, in comparison with spiritual virtues. Newman replied, and as the controversy bore a personal aspect, he published the *Apologia pro Vita Sua*, giving a history of his religious opinions. He endeavored to prove a consistency in his career in spite of the changes in his belief. When the heat of conflict had cooled he regained some favor with those from whom he had separated. Eventually Oxford so far forgave the secession of her distinguished son that in December, 1877, he was elected an honorary fellow of Trinity College. Newman was among those who deprecated the promulgation of papal infallibility by the Vatican Council in 1870. When Gladstone, however, five years later made an attack on Vaticanism, Newman contented himself with pointing out the narrow limits within which infallibility was declared to exist. After the accession of Leo XIII. to the papacy, Dr. Newman was raised to the dignity of cardinal-deacon, May 12, 1879. He resides at Edgbaston, near Birmingham, where he conducts a school for the education of sons of the Roman Catholic gentry, and still supervises the affairs of his order.

A uniform edition of Cardinal Newman's works has

been issued, with some annotations indicating the change in his views since their original publication. Besides the works already mentioned, they include *An Essay in Aid of a Grammar of Assent*, a treatise on faith and reason; *Discourses on the Nature and Work of Universities*, and other educational treatises, and many sermons. He is also the author of several admirable poems and hymns, among which is "Lead, Kindly Light." His writings are noted for the beauty of their style and the purity of their English, as well as for their philosophic treatment of all subjects. Never content with the mere aspect of things, he probes their being until he seems at times to unsettle their reality. Yet his genius is able to present the results of his meditations in most attractive forms. Turning his back on modern criticism and progress, he sympathizes deeply with mediæval scholasticism. His circumstances placed him for a time in the van of a religious movement, but his vocation was always rather that of a teacher, influencing individuals, than that of the leader of a movement. The opposition to liberalism which had been strong in Oxford from 1833 to 1845 lost its importance after his withdrawal. Comparatively few followed him into the Roman Catholic Church, and his subsequent influence was limited almost entirely to that church. (J. P. L.)

NEW MEXICO. Prior to the advent of the Atchison, Topeka, and Santa Fé Railroad, in 1879, the Territory of New Mexico was a comparatively unknown region. The laborious journey over the

plains with ox-teams offered few inducements to emigrants or tourists. Although a part of the United States and under control of the government for 30 years it had received but little attention, and its wonderful natural resources were either unknown or neglected. Delays in settling questions touching the ownership of land and in adjusting conflicts between the races served to retard the progress of the Territory.

With the railroad came an army of active, energetic Americans, who peopled the towns and villages, developed mines, attacked the forests, covered the plains with cattle, and proved the amazing fertility of the soil. Their enterprise has impressed the native Mexican and the Indian, and stimulated the older settlers.

The increase in population has, however, been only about 33 per cent., the population of the Territory at present being about 200,000. The delightful climate and the incentives to fortune-seekers in mining, stock-raising, and farming would have brought many more into the Territory had the land questions or the Indian troubles been settled. Within the years 1886-88 all the hostile Indians have been subdued, and under a firm and enlightened management of Indian affairs no serious trouble is to be apprehended. Many questions affecting the rights of peaceable Indians require the attention and action of the government before full justice is done.

The settlement of the land claims is now being considered by Congress, and it is certainly time that definite action should be taken to carry out the terms of the treaty made by our government with Mexico in 1848. Over 10,000,000 acres are claimed under grants from the Spanish government. The vast majority of these claims are for small holdings, and comprise the best land in the Territory, which has been cultivated for hundreds of years.

Under the treaty of Guadalupe-Hidalgo the United States agreed to protect the holders of property, but their title cannot be made perfect until the land is surveyed by authority of the United States, and the

grants thus located and defined confirmed expressly by Congress.

The Pueblo Indians, 12,000 in number, occupy 19 villages, and own nearly 1,000,000 acres of land. They have herds of horses and cattle, flocks of sheep, cultivate large areas, and raise wheat, barley, oats, corn, fruit, and vegetables. They are steadily improving in their manner of living: leaving the villages and settling on their individual farms, introducing modern agricultural implements and adopting the American dress. The Navajoes number 25,000 and occupy over 8,000,000 acres. They are self sustaining, but depend upon the sale of horses and wool, cultivating but little land. They have not advanced materially in civilization. The Mesquero Apaches number less than 600 and occupy nearly half a million acres of land. They are making commendable progress. The Jicarilla Apaches have in 1888 been located near Amargo, on a reservation embracing 75,000 acres. The tribe has a population of 900, and under suitable control and guidance will become useful members of society.

The Mexican population in the Territory exceeds 100,000. They engage in mining, stock-raising, and farming. The wealthier class are well educated and vie with the progressive Americans in public enterprises. The poorer classes are steadily improving their condition. The opening of markets for their products has increased the raising of vegetables 1000 per cent. in the past five years. This increased income has enabled them to improve their stock, the furniture of their homes, and the quality of their clothing.

Water ditches have been constructed in Laos, Colfax, Lincoln, San Juan, and Mora counties, which have materially increased the area of productive land. Large ditches are contemplated in different parts of the Territory, and if capital for their construction is secured, immense bodies of fertile land will be open to successful occupancy.

The debt of the Territory is about 70 cents per capita, which is less than that of any State or Territory in the Union.

During the years 1884-88 the annual production of gold has increased 200 per cent., and that of silver 30 per cent.; the government has disposed of nearly one million acres of land to settlers, and the area of agricultural products has been increased as follows: corn 3331 acres, wheat 16,649, oats 3889, barley 500, potatoes 600, hay 16,300.

The public school system, owing to the small amount realized from taxes, imperfect administration, and defective laws, is in a backward condition. The mass of the people are, however, awakening to the necessity of popular education, and in a short time will frame their desires in suitable legislative action. During the years 1883-8 at least 10 public school-houses have been built, a few of which are creditable structures. The laws are administered with more rigor, and a larger proportion of the money actually raised is honestly expended. Boarding- and day-schools under private auspices have increased greatly.

The Indian children are now instructed in 1 boarding- and several day-schools under the control of the Interior department of the government; in 2 boarding- and 8 day-schools conducted by orders connected with the Roman Catholic Church; in 1 boarding- and 4 day-schools under the Home Mission Board of the Presbyterian Church; and in 1 boarding-school controlled by the American Missionary Association.

The youths of the Mexican population are cared for in 3 boarding- and 17 day-schools under the Home Mission Board of the Presbyterian Church; in 4 day-schools under the New West Educational Commission; in 1 boarding-school under the Methodist Church, and in several day-schools under the Roman Catholic Church. In some of these the public money pays part of the expense. A school for deaf-mutes has recently been established.

There are several academies and colleges under the

auspices of religious denominations, but the standard is low. They are doing good work, however, and gaining ground every year.

In numbers, wealth, and influence the Roman Catholic Church leads all the religious organizations in the Territory. During the past five years it has displayed commendable activity in erecting fine church edifices and in establishing schools and hospitals. The Jesuits are in strong force, and the Christian Brothers, the Sisters of Loretto, and the Sisters of Charity and other orders are represented. Some of the orders own extensive ranches, gardens, and fruit orchards, and secure a large income by the sale of their products and in the manufacture of fine wines and brandies.

The Presbyterians, the Methodists, the Congregationalists, the Baptists, the Episcopalians, and the Lutherans have churches in nearly every town in the Territory. They have evangelists preaching and working from village to village and from house to house, and are increasing steadily and rapidly.

The only Young Men's Christian Association in the Territory is located at Albuquerque. The Women's Christian Temperance Union has organizations in every large town. A Father Mathew temperance society is also doing good work. Civic societies are represented in Masonry, Odd Fellowship, Good Templars, Knights of Pythias, Grand Army of the Republic, Woman's Relief Corps, American Order United Workmen, Benai Berith, Ancient Order of Hibernians, Catholic Knights of America, and Knights of Labor.

In the larger towns are regular city governments, gas-works, water-works, electric-light-works, street railroads, and telephone exchanges. Seven daily and over twenty newspapers are published in the Territory.

(R. W. D. B.)

NEW ORLEANS, the metropolis of Louisiana, which had by the U. S. census of 1880 a population of 216,190, was estimated by the State Board of Health to have, in 1888, 248,000, of whom 180,000 were white and 68,000 colored. The disproportion of sexes has been steadily increasing for some years; in 1880 the excess of females was 14,318; in 1888 it had grown to 18,623. The race mixture in the population is great, giving the city a very cosmopolitan appearance. Of people of Anglo-American blood there are but 43,124, or about one-sixth of the total; the French and Creoles (descendants of the original French settlers) number 41,720; the Germans and their descendants, 40,346; the Irish, 37,032; Spaniards and Spanish Creoles from Mexico, Cuba, and South America, 6147; Italians, 4226; Jews, 4118; and other white races, mainly Scandinavians, Poles, Hungarians, and Portuguese, 3287. Of the colored or negro population 22,168 are mulattoes or mestizoes, half or more than half white, some of them being seven-eighths white, but classed nevertheless as "negro" or "colored"; and 44,612 are negroes, although a majority of the latter also contain some white or Indian blood. The Indians and half-breeds number 420, and the Chinese, Malays, and other dark races, 800.

The French language, spoken generally by one-third the population ten years ago, is disappearing, although still used by many. German, Spanish, and Italian survive in general use. The "Creole" or African-French spoken by the negroes is now practically extinct.

While the French and Creole influence which formerly dominated the city has latterly perceptibly waned, New Orleans is still largely French in its ideas and customs. The opera is a success as it is nowhere else in America; the public holidays, as Mardi Gras and All Saints' day, when the graves are decorated, are those handed down from the original French settlers, and the social customs and usages are generally of French or Creole origin instead of English or American.

Since the great epidemic of 1878 New Orleans has escaped its former scourge, yellow fever, and has become a far healthier city than formerly. The improve-

ment is largely due to the establishment of an efficient quarantine system, which has exploded the idea, formerly entertained, that yellow fever originated here. The annual death-rate is now 26.45 per thousand, but very unequally distributed, being nearly twice as great among the negroes (39.03 per thousand), who take no sanitary precautions, as among the whites (21.89 per thousand). The Auxiliary Sanitary Association, supported by popular subscriptions, co-operates with the city and health authorities in cleaning the streets and gutters and in caring for the public health.

The diseases carrying off the greatest number of people are consumption, pneumonia, bronchitis, and other diseases of the respiratory organs, which are frequent in winter in consequence of the humidity of the atmosphere; malarial fevers, which, however, prevail mainly in the outskirts of the city, and diseases of the stomach and bowels. On the other hand most zymotic diseases are generally rarer than in other American cities, scarlet fever unfrequent, typhoid fevers very rare, croup seldom, and cholera infantum almost unknown. The summer has, for the past ten years, been the healthiest season of the year, and the worst the beginning of winter when rains are frequent. The most agreeable weather is from the beginning of February to June, when it is dry, clear, cool, and comfortable.

The drainage of the city, which plays an important part in determining its health, is defective, the original plans never having been carried out to completion. Being without sewers, the drainage is all on the surface, the rain water being carried off in open gutters and canals to the rear of the city, where it is pumped over a levee and thence carried to Lake Pontchartrain, while the garbage and sewage are carried to the river in carts and dumped into it. Steps are being taken to improve the drainage by the construction of a new canal running through the centre of the city, and additional drainage machines. Since 1880 the system of flushing the gutters by pumping water from the Mississippi into them has been practiced, and has resulted in keeping them cleaner and improving the public health.

New Orleans, being spread over a large area of territory, 155 square miles, with 450 miles of streets, has paved but a small proportion of them, the rest being "dirt" streets, wholly unpaved. Since 1883 there has been a decided improvement in this respect, 22 miles of pavement having been laid, of which 9 are in asphaltum, 5 in stone, mainly granite, and 8 in iron gravel.

No public buildings of any importance have been latterly erected in New Orleans. The Shakespeare Almshouse, which accommodates 125 paupers, was erected in 1880, on Carondelet street. Additions have been made to the famous Charity Hospital, and an ambulance service established in connection with it. Other late additions to the already numerous charitable institutions of New Orleans are the Touro Infirmary and Hospital and the Asylum of the Little Sisters of the Poor (Catholic), on Prytania street, and the Jewish Widows' and Orphans' Home on St. Charles avenue. The latter institution is established for the benefit of the Jews of all the Southern States.

The educational advantages of New Orleans have improved greatly since 1880. The donation by Mr. Paul Tulane of \$2,000,000 to the University of Louisiana, the name of which was, in his honor, changed to Tulane University, enabled that institution to greatly extend its operations. An industrial school was established in 1883, and a museum in 1885, and a series of free lectures has been since delivered each winter. Including the medical, law, academical, and industrial departments the college will now average 1200 students in attendance each year. The Sophie Newcombe College for Girls, a branch of Tulane College, was established in 1886 with a donation of \$200,000 from a lady of Louisville.

The colored people of New Orleans have the advantage of four colleges: Straight University (Congregational), Leland University (Baptist), New Orleans University (Methodist), and the Southern University, undenominational and supported by the State. All four are open to both sexes and have an average annual attendance of 1250, about equally divided between males and females. The College of the Immaculate Conception (Catholic), with 450 students, is also authorized to grant degrees.

The Howard Memorial Library, with 125,000 volumes, was erected in 1888 by Miss Annie Howard. The only other public libraries are the Louisiana State Library, 30,000 volumes, and the Fisk or Tulane Library, 12,000.

The commerce of New Orleans has undergone important changes in the last ten years with the construction of railroads. Formerly the trade was almost wholly done on the Mississippi, and "the levee," as the river front of the city is called, became the most active commercial point in the world. As late as 1882 the steamboats and barges handled the greater bulk of the receipts from the interior, but since then the railroads have surpassed them, as shown by the following table of value of receipts of produce:

Year (ending Aug. 31).	Receipts by river.	Receipts by rail.	Total value.
1880.....	\$120,006,300	\$59,765,300	\$179,771,600
1881.....	132,278,425	65,499,750	197,758,175
1882.....	97,187,406	62,329,323	159,516,729
1883.....	117,998,950	82,019,995	200,018,945
1884.....	80,390,194	80,878,843	161,269,037
1885.....	72,803,584	90,920,226	163,723,810
1886.....	65,986,453	104,681,456	170,667,909
1887.....	59,326,765	104,901,839	164,228,604
1888.....	61,420,251	107,054,142	168,474,393

There were three trunk railroad lines reaching New Orleans in 1882. A fourth was built that year, a fifth in 1883, and a sixth in 1885. There are in addition two local railroad lines, the New Orleans, Terre-aux-Bœufs, and Gulf, and the New Orleans and East Louisiana Railroad.

The effect of railroads upon the river traffic is seen in the arrival of steamboats and barges:

	Steamboats.	Barges.	River tonnage.
1880.....	2,658	857	2,809,950
1881.....	2,562	838	2,427,439
1882.....	2,413	857	2,331,528
1883.....	2,335	876	2,261,409
1884.....	2,175	835	2,167,858
1885.....	2,162	932	2,260,400
1886.....	1,954	967	2,184,840
1887.....	1,908	1,099	2,211,350

On the other hand the railroads have increased their tonnage steadily, as follows:

	Received.	Shipped.	Total Tons.
1880.....	543,076	455,712	998,788
1881.....	558,261	474,275	1,132,536
1882.....	685,020	555,639	1,240,679
1883.....	884,223	597,510	1,481,733
1884.....	894,371	623,618	1,517,989
1885.....	1,063,185	619,784	1,622,969
1886.....	1,125,809	635,418	1,761,227
1887.....	1,344,430	746,146	2,090,576

While the commerce of New Orleans has changed much in the last ten years, the volume has increased, the loss in foreign imports and the coastwise trade with the Gulf towns being more than compensated for by the improved trade with New York. The following

shows the value and distribution of the entire commerce of the city for 1886:

Ocean Commerce.			
	Foreign.	Coastwise.	Total.
Imports.....	\$3,115,171	\$51,442,628	\$59,557,799
Exports.....	82,560,198	38,264,984	120,825,182
Total	\$90,675,369	\$89,707,612	\$180,382,981

Receipts of Produce from Interior.

	Tons.	Value.
By river.....	2,337,226	\$61,911,534
By rail.....	1,344,430	106,622,320
Total.....	3,681,656	\$168,533,854

Shipments to the Interior.

	Tons.	Value.
By river.....	1,390,538	\$35,826,230
By rail.....	746,146	62,488,920
Total.....	2,136,684	\$98,315,150

Total Trade.

	Tons.	Value.
With interior.....	5,818,340	\$266,849,004
Total ocean trade.....	2,198,575	180,382,981

Grand Total of Trade.

	Tons.	Value.
For 1886	8,016,915	\$447,231,985
For 1887	8,324,372	462,211,178

New Orleans up to 1870 was almost wholly a commercial city, but since then, and particularly since 1880, it has been forced by trade changes more and more to manufactures, in order to find employment for its working classes. From 1870 to 1880 there were 12,000 men employed in handling cotton in the compresses and placing it aboard ship; while in 1888 the number was reduced one-half. On the other hand there has been a large increase in the number of persons engaged in manufactures. The following table gives the manufacturing statistics:

Year.	Estab-lish-ments.	Capital.	No. hands Employed.	Wages paid.	Value of Products.
1870	554	\$5,429,140	4,411	\$1,204,254	\$8,450,439
1880	896	6,430,303	7,844	3,317,777	18,052,596
1888	2,185	21,667,670	23,865	8,242,599	41,606,546

The chief industries are, boots and shoes (products, \$2,227,500), bread and bakery (products, \$1,923,750), clothing (\$4,424,500), machinery (\$1,485,200), beer (\$1,277,210), lumber, etc. (\$1,484,146), cotton-seed oil and fertilizers (\$3,187,100), rice cleaning and polishing (\$2,792,750), sugar refining (\$7,335,000), and tobacco and cigars (\$1,898,500). There were, in 1888, 3840 women engaged in factory work against only 120 in 1880.

With these new factories important changes have come over New Orleans industrially, socially, and otherwise. Many buildings formerly devoted to commerce have been fitted up as factories. The long period, from May to October, formerly known as "the dull season," when the city went to sleep and business was generally suspended, has disappeared, the factories remaining open and in operation throughout the year.

The control of the city debt is in the hands of a "Board of Liquidation," under whose administration it is being reduced at the rate of \$275,000 a year. The bonded and floating debt amounts to \$17,491,546.

The streets, squares, and public buildings of New Orleans are lighted altogether by electricity, the tower system prevailing in the suburbs. For drinking water the inhabitants are dependent almost wholly on cisterns

and rain, the water-works supplying only the muddy water from the Mississippi, which has to be filtered before use. Latterly a dozen or more artesian wells have been sunk in the city limits, and have struck an abundant supply of water, excellent for drinking or manufacturing purposes, at a depth of 1000 feet.

The history of New Orleans since 1880 has been uneventful, the most important item being the International Exposition held there in 1884-1885, and continued during 1885-1886.

This exposition, known as the World's Industrial and Cotton Centennial Exposition, opened in December, 1884. The United States contributed \$1,000,000 towards its expenses, besides \$350,000 to enable the several Federal departments to make displays. The grounds covered 249 acres. The principal buildings were: the Main Building, 1378 by 905 feet, or 33 acres, the Music Hall in its centre having a seating capacity for 13,000 people; the U. S. Building, in which the United States and the several States had their exhibits, 885 by 565 feet; the Art Gallery; Horticultural Hall, wholly of glass; Factory and Mill Building, for the exhibition of machinery; and the Mexican National Building, where the Mexican display was exhibited. All the States and Territories had exhibits, and of foreign powers there were represented Mexico, all the Central American states, Brazil, England, France, Italy, Russia, Germany, China, Japan, Siam, and other countries. Although the amount of space covered and the number of exhibitors were greater than at any previous World's Exhibition, the attendance was not so large, falling short of 3,000,000. (N. W.)

NEWPORT, a city of Kentucky, the county-seat of Campbell co., is on the Ohio River, at the mouth of the Licking River, 1 mile from Cincinnati, on a branch of the Louisville and Nashville Railroad and the Elizabethtown and Big Sandy Railroad. It has a fine courthouse, post-office, and Masonic temple, 5 hotels, 2 national banks, 1 tri-weekly and 3 weekly newspapers, 20 churches, and 5 schools. The industrial establishments comprise large iron-rolling-mills, bolt-works, pipe-foundry, flour-, saw-, and planing-mills, tool- and tile-works. It has gas- and water-works, a paid fire department, and a park. Its property is valued at \$7,000,000, its public debt is \$1,042,000, and the yearly expenses are \$143,000. It is connected with Covington by a suspension bridge over the Licking River, and with Cincinnati by a railroad bridge with roadways and footways (see BRIDGES, fig. 40). There is also a steam ferry to Cincinnati, and a line of street cars to Covington. Newport, settled in 1791, had in 1880 a population of 15,693.

NEWPORT, one of the capitals of the State of Rhode Island, is on the west shore of See Vol. XVII. Rhode Island, in Narragansett Bay, 5 p. 406 (p. 416 miles from the ocean and 22 miles south of Providence. It has a spacious and commodious harbor, which is defended by Fort Adams, 1½ miles from the city. The U. S. torpedo station is on an island in the harbor. The city contains a state house, U. S. custom house, city hall, 2 libraries, 5 national, 3 State, and 3 savings banks, 15 churches, a high school and other schools, 1 daily and 2 weekly newspapers. The industrial works comprise a brass foundry, 2 cotton-mills, and lead-works. Newport has daily steamboat communication with New York and Providence. It is now chiefly noted as a summer resort, the whole southern part of the island being occupied with hotels and villas. The beach is one of the finest in the United States for bathing and for promenades. Bellevue avenue and Ocean drive are noted for their fine equipages during the summer season. Newport was settled in 1638 by William Coddington, who had separated from Roger Williams' colony. Before the American Revolution the town had become noted for its commercial enterprise. The Redwood Library and several of the public buildings belong to this period. During the revolutionary war the island was occupied

by 8000 British and Hessian troops, who inflicted great injury on the town. The commerce then transferred to New York was never regained. But the excellence of the beach and harbor has made Newport a famous summer resort.

NEW TESTAMENT. This name is applied to the twenty-seven books, originally written in Greek, which are recognized as authoritative among Christians. The term is derived from *Testamentum*, the Latin equivalent for the Greek *διαθήκη*, which usually means "covenant," a more appropriate and significant title. But usage will not now permit an alteration of the name. The articles on the BIBLE in the *ENCYCLOPÆDIA BRITANNICA* and in this *SUPPLEMENT* treat with much fulness of the main questions respecting the New Testament. The articles on the GOSPELS and on the respective Epistles deal with the special topics connected with the separate books. But a supplementary article is necessary: (1) There has been some addition to our knowledge of the literature of the earlier Christian centuries since the article BIBLE was prepared for the *BRITANNICA*; (2) The treatment in that article suggests doubts to an unnecessary extent; (3) The several books having been discussed by different authors representing a variety of opinion, there is a lack of unity in the other articles referred to. The point of view in the later volumes of the *BRITANNICA* is more rationalistic than that taken by the authors who write on the New Testament books in the earlier volumes.

The topics properly belonging to this article are three: I. The origin of the New Testament books. II. The preservation of this literature. III. The collection of it as a body of writings claiming authority among Christians. These topics are named respectively: Higher criticism of the New Testament; Textual criticism of the New Testament; Canon of the New Testament. The last has been adequately treated in the articles CANON in the *BRITANNICA* and this *SUPPLEMENT*. It will only be necessary to discuss the first and second.

I. *The Origin of the New Testament Books.*—(1) After protracted discussion, it seems more positively proven than ever before, since the question has been formally raised, that all of the books were written in the first century, between A. D. 53 and 97, that each one is the work of its reputed author (the case of the anonymous Epistle to the Hebrews being an isolated one), that the historical books are trustworthy histories, and that each presents characteristics distinguishing it from all other literature outside this collection, and that taken together the collection forms the authoritative rule of faith for believers in Jesus Christ. The Old Testament writings also constitute a part of this rule of faith, but the fuller and complete revelation is made in the New Testament. The unique character and authority of these writings is due to inspiration, which our Lord expressly attributed to the Old Testament, and which becomes all the more necessary in connection with the records which present to us Jesus Christ himself, since he says of the Old Testament Scriptures, "These are they which bear witness of me" (John v. 39).

2. The earliest books written were six of the Epistles of Paul, namely, 1 and 2 Thessalonians, Galatians, 1 and 2 Corinthians, and Romans (A. D. 53-58). The four last named are "undoubted," no critic, however destructive in his theories, has denied that they were written by the apostle, and near the date given above. It follows, therefore, that in A. D. 58 the belief in Jesus Christ was widely extended throughout the Roman Empire; that the personal object of this widely extended faith was held to be a historical person who had lived and taught in Judea a short time before. It was also held that he had been put to death and risen from the dead on the third day, sending down the Holy Spirit to work spiritual life in those who trusted in him. These are the facts assumed throughout in the

"undoubted" Pauline epistles. We have other literature bearing the name of Paul, other letters purporting to come from other apostles, and five books of a historical character, telling the story of this same Jesus Christ whom Paul preached, one of them narrating the early efforts of the preachers. The question then arises: Are these books what they purport to be? or can we account for them as forgeries or as later "manipulations" of earlier (and truer) documents? The latter view is suggested again and again in the *BRITANNICA*; the former has all the positive evidence to support it. Moreover, when the leading Pauline epistles have been accepted, the rejection of the other New Testament writings cannot be readily justified. (1) If any books, the Gospels for example, are objected to, because they contain statements that imply the exercise of supernatural power by Jesus Christ and his apostles, then the Pauline epistles are open to the same objection. But these epistles cannot be denied; hence a book is not necessarily spurious or "manipulated" if it narrates miracles. Yet many of the historical-critical school argue for the later origin of the Gospels on the assumption just stated. (2) Since the undoubted Pauline epistles prove the existence of a widespread belief in Jesus Christ as early as A. D. 58, it is exceedingly probable that other Christian literature would soon be penned. The belief in Christ was of such a character that it would be impossible to leave the story unrecorded. (3) The only records that have come down with any claim to historical accuracy are those included in the New Testament. In fact there is no proof that any books were written in the first century, other than the four canonical Gospels, that attempted to narrate the history of Jesus Christ. It has often been assumed and asserted that many such Gospels existed, but there is no proof of it. Those who believed in Jesus Christ as Paul did would desire some succinct and truthful records, and when such records were made they would be carefully preserved. Luke, it is true, refers to "many" who had made attempts to write on this subject (i. 1), but his language does not imply that these writings were full histories. He rather suggests that they were unsatisfactory. At all events we have no material of any consequence outside the canonical New Testament respecting the history of Jesus Christ, and no positive evidence exists that any full accounts were written at the same time with our canonical Gospels. It seems certain that some Gospel histories would be written, since the belief in Jesus Christ was so widespread. From the earliest times these four canonical Gospels have been accepted as veritable histories of the person in whom Christians believed. (See below.)

3. The twenty-seven books constituting the New Testament were all written in the first century, between A. D. 53 and 97. The minor details of date and order are open to doubt; but the repeated attempts to prove that some of the books were written in the second century have utterly failed. The evidence in favor of the earlier date, always strong, has been augmented during this generation. The probable chronological order of the books is as follows:

A. D. 53-58: Pauline Epistles, first group (1 and 2 Thessalonians, Galatians, 1 and 2 Corinthians, Romans).

A. D. 61-64: Pauline Epistles, second group (Colossians, Ephesians, Philemon, Philippians).

A. D. 60-70: Matthew, Mark, Luke, Acts, James, 1 Peter.

Uncertain date, but before A. D. 67: 1 Timothy, Titus, 2 Timothy, Hebrews, 2 Peter, Jude.

Toward the close of the century: Gospel of John, Epistles of John and Revelation (an earlier date for the last is assigned by many).

The points open to discussion respecting the time of composition are treated of in the articles upon the several books. The genuineness of the epistles may be accepted as established, since the most serious ob-

jections raised against the Pastoral epistles and 2 Peter have been repeatedly answered. (See articles PASTORAL EPISTLES and PETER.) The important questions respecting the Apocalypse are fully discussed in the article REVELATION. But the most persistent attacks have been made upon the genuineness of the four Gospels. While Dr. E. A. Abbott, in the BRITANNICA, has given an elaborate statement of many of the questions respecting the Gospels, the positions taken are far from satisfactory, and the evidence presented is not convincing. It is, therefore, necessary to discuss more fully the origin of the Gospels.

4. The four canonical Gospels are all of them genuine, that is, the work of their reputed authors. Despite the common matter found in three of them, these three (Matthew, Mark, and Luke) are in all probability independent of each other (in a literary sense), the common matter being derived from the substance of the oral preaching of the apostles and early disciples. The positions of Dr. Abbott, to which most serious exceptions must be taken, are: (1) his theory of the origin of the synoptic Gospels; (2) his denial of the genuineness of the Fourth Gospel.

5. The origin and relation of the synoptic Gospels. The problem has been discussed most vigorously, but is still far from a satisfactory solution on any theory other than that of independence. It still seems most probable (as Canon Westcott, Godet, and others hold) that no one of these three writers borrowed matter from the Gospel written by either of the others. It is not probable that any one of them ever saw the work of the other. There is no internal evidence of any one of them having written (or modified) his narrative to supplement, correct, or adapt the work of another. Nor can the theory of a common document as the basis of all three be established. Dr. Abbott "passes his pen through all that is not common to the three synoptists, and offers us the residuum as the closest approximation we possess to the original narrative from which each of the three was derived" (Dod's *Introd. to the New Testament*). The same theory has been most beautifully illustrated in a printed edition of the Greek Testament, called *Synopticon*, of which Dr. Abbott is one of the editors. But a careful study, with this convenient help, does not convince the writer that we are thus brought nearer to the original source of the narrative. It is true, and has long been remarked, that the Gospel of Mark bears greater evidence of originality than either of the others, and that were there an original Gospel as a common basis of all three, Mark most nearly represents that original. But further than this we can scarcely go, nor is there anything to be gained by going further. Either our canonical Gospels are true or they are full of later additions. As a literary problem we may discuss the literary origin of the different forms of the same story as recorded by two or more of the evangelists. But the unfairness of most of the critics consists in this, that they suggest and imply what they will not assert. They claim that the discussion is a purely literary one, and presently we discover that it is a historical one. The truthfulness of the various narratives is assailed under cover of a literary problem. The Tübingen school was entirely honest in its attitude. It attempted to solve the literary problem by a certain historical theory (*Tendenz-theorie*), to the effect that there were two opposing parties in the early Christian Church, and that the Gospels arose in the second century as the result of these conflicts and attendant compromises. This theory has been disproved; all more recently discovered evidence controverts it, though much deference is paid to it in some of the articles in the BRITANNICA. The present "critical" school does not accept this theory, but seeks to discover the original historical basis of the Gospels. Sometimes this is done without denying the truthfulness of our Gospels, but oftener it is implied that all the matter which cannot be traced to some assumed "original source" is less trustworthy. Against

the entire method it may be urged that no positive results have yet been firmly established, despite the immense amount of labor bestowed upon the problem. Twenty distinct theories could be cited, each differing from the others, and some of them destructive of each other. For example, Meyer and Weiss, two of the most distinguished German commentators, agreeing in many respects, differ in regard to the relation of the synoptic Gospels, Meyer holding Mark to be the earlier, Weiss stoutly contending for Matthew, while they differ as to the "original source" lying back of the synoptists. Weiss accepts a large amount of narrative matter in the "apostolic source" which he assumes to lie back of the Gospel of Matthew. To this Meyer responds in substance: "If there is so much narrative, why not accept the Gospel of Matthew itself as the original source?" Indeed the attempt to separate the "discourses" from the history can only prove a sorry failure; many of the most striking sayings derive their pertinence from the occasion (often a miracle) that suggested them. The height of absurdity was reached in this discussion by Ewald, who, in his analysis, finds ten distinct books, seven of them going to make up in differing combinations the three synoptical Gospels. It is, of course, an interesting literary problem, and in discussing it there is room for great ingenuity. But thus far one man's guess has proved as good as another's.

In order to find room for all this literary development it is necessary to place the date of writing at a time which, on other grounds, seems too late. The three synoptical Gospels bear every mark of having been written before the destruction of Jerusalem (A. D. 70). Dr. Abbott makes a labored plea for a later date in the case of Luke. But the only argument of any special force is that from Luke's specific references to the details of the destruction of Jerusalem (chaps. xix. 43; xxi. 24). It is urged that such plain statements could have been written only after the event. That amounts to this position: because Luke represents Jesus Christ as making a distinct prediction which was speedily fulfilled, Jesus Christ did not make the prediction, but Luke invented it and put it in his mouth. Unfortunately Dr. Abbott is not alone in arguing upon such an assumption. But it is clear from the Book of Acts that the Gospel of Luke was written as "a former treatise" (Acts i. 1). The narrative in the Book of the Acts closes with A. D. 63. It is natural to infer that the date of the second treatise was near that time. Furthermore, Luke was with Paul at Cæsarea during the years 59, 60. Would it be more natural than to suppose that during this time he collected the material for his Gospel, since he refers to his labors in discovering the facts (Luke i. 3)? It is exceedingly improbable that ten years would elapse before he published these facts. It is therefore likely that all three Gospels had been penned by the close of A. D. 63. There is not sufficient time for editing and manipulating "original sources" in the interval between the death of Christ and this date.

The recently discovered evidence, moreover, confirms the early date of the Gospels. Not only is it now established that the Epistle of Barnabas expressly cites the Gospel of Matthew, but the *Teaching of the Twelve Apostles* again and again uses the language of that Gospel, and in some cases seems plainly to refer to that of Luke. This document, lost for many centuries, was written about A. D. 120. It was discovered in 1873, but not published until 1883. In the same collection of MSS. the entire Homily (misnamed 2 Clement) was discovered. In this sermon the preacher refers to the New Testament Scriptures as τὰ λόγια τοῦ θεοῦ (chap. xiv.). Now the date of this homily is between A. D. 120 and 140. By that time clearly the Gospels were read in Christian assemblies as Sacred Scriptures. Papias has referred to Matthew as writing "logia," and it has been stoutly affirmed by some critics that this term can only mean "discourses," and

cannot mean a gospel like ours. Yet the same term is used by a contemporary of Papias in the technical sense of Scripture, as indeed was done by Paul in Rom. iii. 2. We may add that these recent discoveries of Christian literature written in the early part of the second century go far to establish the impossibility of any author in that age having the ability to write (or even edit) our Gospels. All this makes against the theories which find in the synoptic Gospels matter added or modified by later hands using a common original source.

The results of textual criticism come in as corroborative evidence (see below, II.). We now know from most abundant manuscript authority just how much of alteration has taken place in the New Testament text during eighteen centuries. In the Gospels the various readings are most numerous. But all the variations in all the Gospels taken together do not constitute a sufficient amount of variation to account for the differences between the synoptic narratives in a single chapter. When once the Christians accepted these books they were carefully preserved from modification. How unlikely it is that there was some older Gospel (truer than these, as is assumed) which, instead of being carefully preserved, was edited by various hands and the results palmed on the Christian people as the work of the reputed authors? If for eighteen centuries believers have been careful of the Gospel records, the earliest believers would not be less so in the care of an original Gospel. Hence it is not probable that any original Gospel other than ours ever existed and obtained currency. The early age of the synoptic Gospels is more fully established now than ever before, and the earlier the date of composition the more probable is their literary independence. The arguments against their truthfulness from alleged discrepancies need scarcely be considered here. No greater divergence in testimony exists than might be expected from the different purpose, point of view, and emphasis. Absolute contradictions cannot be said to exist. It is true there remains an unsolved difficulty in regard to the original language of the Gospel of Matthew. The constant early tradition states that it was first written in Hebrew; but only the present Greek Gospel is cited by the same witnesses, and there are marks of its being an original Greek work. The tendency now is to accept our Gospel as the Greek original, but the theory of a Hebrew original translated by Matthew himself would account for the two classes of facts indicated above. Such a theory is far more probable than most of the solutions of the synoptic problem.

6. *The Genuineness of the Fourth Gospel.*—Dr. Abbott doubts or denies that the apostle John was the author of the Gospel bearing his name. (In the article REVELATION will be found a discussion of the objections arising from the differences of style and language between this Gospel and the Apocalypse.) To deny the genuineness of this Gospel is a much more serious matter than to hold certain literary and critical views of the origin of the synoptic Gospels. Those Gospels do not assert their authors and authority; the Fourth Gospel expressly claims to be written by the beloved disciple, and frequently makes statements and explanations with apostolic authority. The alternative here, at all events, is: Is this book genuine or is it a forgery? As Dr. Abbott has stated very fully his objections to the Johannine authorship, the other side must now be given.

A. *External Evidence.*—The testimony is not only unbroken, but more abundant and positive than in the case of the synoptic Gospels. Nor are we without recent additions to this evidence. It was long known that Tatian (died A. D. 172) wrote a *Harmony of Four Gospels* (*Diatessaron*) between 153 and 170. But as the work was lost, it could not be proven that he used the Gospel of John. Recently the discovery of an Armenian translation of a commentary upon it by

Ephraim the Syrian makes it certain that he used our four Gospels. (The Armenian work was translated into Latin in 1841, but escaped general notice until 1876. Since that date the text of Tatian's *Harmony* has been largely reconstructed from it.) Shortly after the middle of the second century the four Gospels were so widely known and accepted by Christians that a harmony of the four narratives was prepared. This proves that all four had been received for some time. Indeed, there are no indications of any serious objections to the Johannine authorship of the Fourth Gospel in the second century. The Alogi were a handful of eccentric persons with extravagant views about the New Testament, and their doubts have no weight whatever. The testimony of Irenæus (Bishop of Lyons, A. D. 178) is specific and ample as to the Johannine authorship and general acceptance. It would seem probable, therefore, that a book accepted as the work of the apostle John by Tatian (between 150 and 170) would be known to Justin Martyr, who was the teacher of Tatian. The interval of time between the *Apology* of Justin (A. D. 138–147) and the *Diatessaron* of Tatian is not long. At the date of the latter the Gospel of John was everywhere accepted. How could a forgery have gained currency between the date of Justin's *Apology* and the appearance of the *Diatessaron*? Dr. E. A. Abbott, in the *BRITANNICA*, makes a full and plausible argument against Justin's knowledge and use of the Gospel of John. But Prof. Ezra Abbot, the distinguished Unitarian Biblical scholar in Harvard University, published as his last work a small volume on *The Authorship of the Fourth Gospel: External Evidences*, which fully, fairly, and with an affluence of citation, answers every objection raised in the *BRITANNICA*. The argument cannot be given in detail, but as this most valuable and learned monograph is not properly known, it is well to cite in full the summing up of the case respecting Justin Martyr's knowledge of this Gospel. "We find," Prof. Ezra Abbot says, "(1) That the general reception of our Four Gospels as sacred books throughout the Christian world in the time of Irenæus makes it almost certain that the 'Memoirs called Gospels,' composed by Apostles and their companions, which were used by his early contemporary, Justin Martyr, and were read in the Christian churches of his day as the authoritative records of Christ's life and teaching, were the same books; (2) That this presumption is confirmed by the actual use which Justin made of all our Gospels, though he has mainly followed, as was natural, the Gospel of Matthew, and his direct citations from the Gospel of John, and references to it, are few; (3) That it is still further strengthened, in respect to the Gospel of John, by the evidence of its use between the time of Justin and that of Irenæus, both by the Catholic Christians and the Gnostics, and especially by its inclusion in Tatian's *Diatessaron*; (4) That of the two principal assumptions on which the counter-argument is founded, one [that Justin's description of the manner of the teaching of Jesus shows that he did not know the Fourth Gospel] is demonstrably false, and the other [that if he used it at all he would have used it more] baseless; and (5) That the particular objections to the view that Justin included the Gospel of John in his 'Memoirs' are of very little weight. We are authorized then, I believe, to regard it in the highest degree probable, if not morally certain, that in the time of Justin Martyr the Fourth Gospel was generally received as the work of the apostle John" (*Authorship*, etc., pp. 79, 80). The learning of Ezra Abbot is evinced in his treatment of this question; his candor is transparent, and of theological bias there could be no suspicion in his case.

But it can be claimed that the Gnostic sects flourishing during the lifetime of Justin Martyr accepted and used the Fourth Gospel as the work of the apostle John. The evidence from Hippolytus seems quite clear that Basilides and Valentinus before the middle

of the second century used this Gospel without question. As it was an armory of attack for their orthodox opponents, the fact that they did not deny its authority seems conclusive against every attempt to prove a later origin than the apostolic age. Were it forged or altered to sustain orthodoxy, these heretics would have so asserted. Furthermore the development of heresies (or even differences of opinion) requires time. Since these Gnostics used the Gospel of John without question as well as their opponents, at no time during the development of this difference could a spurious Gospel have been palmed off as written by John. In view of this it is impossible to date the Gospel in the second century. Those who will not accept it as genuine still claim as late a date as A. D. 110 or 115, but with no positive evidence to support this view, and without being able to find any one who could have written such a work. But suppose it were written (that is, forged) in A. D. 115. There were probably thousands of Christians then living who had known the apostle John. How could a forgery at that time have obtained universal acceptance? In Ephesus, a great commercial city, where John had been living, some one would have detected the fraud. Only when we can believe that the Christians of that age were as credulous in their faith as the modern opponents of this Gospel are credulous in their unbelief, can we regard such a date for the Gospel as in the slightest degree probable. Prof. Ezra Abbot calls attention to some of the closing words of the Fourth Gospel ("and we know that his testimony is true") as containing an "attestation to the truth and genuineness of the Gospel." Such an attestation would never have been appended to a forged document.

B. Internal Evidence.—Here we are confronted even more directly with the alternative, truth or fraud. The moral tone of the Gospel is such that a forgery seems a psychological monstrosity. Yet the author so describes himself, without any immodesty or self-assertion, as to convey everywhere the impression that he was "the beloved disciple." The objections raised from the assumed contradictions to the synoptic narratives have been repeatedly answered.

The positive internal evidence is derived (1) from the style, which points to the author as a Hebrew Jew (not a Hellenist) who was yet familiar with the Greek language from long residence in a city where that language was spoken. The simple structure also points to an aged man. There is no one who so well suits these indications as the apostle John.

(2) That the author had lived in Palestine is also evident from many local allusions, and from the familiarity with Jewish usages. It has been objected (by Matthew Arnold among others) that he refers to these matters as a foreigner might do. But the Gospel, it is claimed by all, was written after the destruction of Jerusalem, when Jewish usage was comparatively unknown in Asia Minor, and explanation was required. The knowledge of Jewish affairs in the time of Christ, evinced by the author, is strikingly minute.

(3) The evidence that the author was an eye-witness of many of the events he records is obvious even to a careless reader of the Gospel. He refers to persons, what each one said, as the synoptists do not. Well-nigh every chapter contains some mark that suggests the presence of the author. Not only so, but he speaks of himself as present, claims especially to tell what he has seen. "Here we are driven to the alternative: either the writer was a true witness of what he relates, or he was a false witness who wrote down a deliberate lie" (Schaff).

(4) The writer intimates again and again that he was one of the Twelve. He tells what the others said, naming one and another. He modestly conceals his own name, but in so doing all the more conclusively reveals his own person. It can scarcely be denied that the author meant to convey the impression that he was the apostle John. Moreover, the explanations he in-

serts, the tone of authority he sometimes assumes, go to show that the author knew himself to be (without proving it) one who was recognized as entitled to speak in this way. The probability that any one could have thus successfully personated the apostle in a literary forgery is very small; that any one in the first quarter of the second century could have done it would seem impossible save to those who have prejudged the case.

The argument from internal evidence may be closed by a citation from Prea, T. W. Dwight (Godet's *Commentary on the Gospel of John*, Amer. ed., pp. 511, 512): "There is no doubt that the author of this Gospel penetrated in his thought into the centre of the Christian system, as it has been understood by the church. The question of the authorship becomes, therefore, one of gravest importance. If the author was that most intimate disciple of Jesus of whom the book speaks so frequently, he gained his conception of Christ and the new faith from the Lord himself, and could not be mistaken. His book is the flower and consummation of the apostolic thought. It is in the truest and highest sense inspired of God. The attempt to deny the system is a hopeless one, so soon as this Gospel is established on a firm foundation. In view of this fact, it may well seem divinely ordered that the book should stand in the world as it has ever done, bearing within itself its own evidence. The writer of it, in addressing the readers for whom his first Epistle was intended, says that he writes that which he has seen and heard, in order that they may have fellowship, as he himself has, with the Father and with his Son Jesus Christ. It is a wonderful fact in the history of the centuries which have passed since he wrote, that those who have been persuaded by his story to believe and who have been conscious, as the result of their faith, that they had fellowship with God, have had an abiding confidence that he told of what he had heard and seen, and that it is those who have rejected the doctrine and the peculiar life, who have questioned the reality of the author's experience as the disciple whom Jesus loved. The past may give us confidence in the future; and we may safely predict that, until the inner life of the author ceases to bear this witness, he and his Gospel will be among the unshaken pillars of the church."

7. The Acts of the Apostles.—That this book was written by Luke, the companion of Paul, is suggested by internal evidence, and has been supported by external evidence from the earliest times. But the Tübingen school assumed to find in it irreconcilable differences with the four Epistles of Paul they accepted as genuine. This was necessary for their theory. But many of their arguments rest upon false exegesis, and few scholars now accept their extreme conclusions.

Still in the BRITANNICA there are suggestions made casting doubt upon the historical verity of the narrative. Here, as in the case of the Gospels, a "patch-work" theory of the origin of the book has been accepted by many critics. Some parts, *e. g.*, the sections where "we" is used, were written by Luke, but the book has been edited by a later hand in the second century. It contains a basis of truth, but is not all of it historical.

But the clumsiness of this theory is apparent even to Renan. If the integrity of the book be accepted, the whole of it must be ascribed to Luke. The date would seem to be not much later than A. D. 63, at which time the narrative ends, somewhat abruptly. The positive proofs of the authenticity of the entire narrative are very strong. No other historical book of the New Testament touches upon so many points where verification from other sources is possible. The titles applied to magistrates in the different cities, the topographical allusions, the hints of local usage, the itineraries—all these in hundreds of instances have been proven accurate, even when imperfect knowledge had previously indicated that the author had made a mistake. (In Schaff's *History of the Christian Church*,

Vol. I., pp. 732-736, fourteen of these confirmatory facts are discussed.)

Objections have been raised to the reports of the discourses recorded in this book. But a careful comparison of the speeches of Peter and Paul respectively with the writing of these apostles confirms the accuracy of the author of the Acts. Indeed the investigations have gone further: it has been shown that the different discourses attributed to Paul give evidence in style of the presence and absence of Luke, of the circumstances connected with their delivery as stated in the Acts. Objection has been made to the substance of these discourses, as indicating a "purpose" in the author who records them. This is an echo of the Tübingen theory. The entire narrative has such marks of candor that it seems psychologically impossible for the author to have distorted the language of the apostles to serve his own theological or literary purpose. "Examine and compare the secular historians from Herodotus to Macaulay, and the church historians from Eusebius to Neander, and Luke need not fear a comparison. No history of thirty years has ever been written so truthful and impartial, so important and interesting, so healthy in tone and hopeful in spirit, so aggressive and yet so genial, so cheering and inspiring, so replete with lessons of wisdom and encouragement for work in spreading the gospel of truth and peace, and yet withal so simple and modest, as the Acts of the Apostles. It is the best as well as the first manual of church history" (Schaff, *ibid.*, p. 739).

8. *Comparison with the Literature of the sub-Apostolic Age.*—Accepting as proven the genuineness of the twenty-seven books constituting the New Testament, we may call attention to the facts respecting the Christian literature of the succeeding age. The additions to this literature recently discovered have already been referred to. One and all of the Christian writings of the generation succeeding the apostles fall immeasurably below the New Testament literature. That some of the former were highly esteemed for a time in the Christian Church is well known, but they were never exalted to a level with the New Testament by any formal act or by general consent. So soon as controversy arose and the question of authoritative writings was considered, the canon of the New Testament was formed, and with little difficulty (see article CANON). But the fact on which emphasis must be put is this: that there is an obvious descent from the New Testament to the apostolic fathers, that no one in the first half of the second century appears as an author capable of writing any of the books of the New Testament. While each age of the church rightly reviews the whole question of the origin and authority of the New Testament books, added to the historical evidence there is this obvious difference in the literature to give internal attestation. The proof of the existence of the sun is its shining; the New Testament shines by its own light.

II. *The Preservation of the New Testament Text.*—This study is called "textual criticism," in distinction from the "higher criticism." Both are necessary, but they differ in their aim. The higher criticism discusses the origin of the books, the lower (or textual) criticism seeks only to discover a pure and entire text. Hence it deals only with positive evidence, allows no conjectural emendation, and never impugns the authority of a book, questioning only whether the very words have been preserved uncorrupted. As is well known the sources for determining the exact words of the New Testament are vastly better than in the case of any other book. The very extent of our authorities has multiplied minor variations; yet despite all this, the number of various readings is not proportionately so great as in the works of some classical authors of which few manuscripts exist.

The subject of New Testament textual criticism has been treated by Prof. W. Robertson Smith in the *BRITANNICA* (article BIBLE); but during the years

since that volume was published there has been a remarkable advance in this science. A few old manuscripts have been discovered (notably *Codex Rossanensis*), but the main progress has been in the recognition of correct principles. The discovery of Aleph by Tischendorf and the publication of B (*Vaticanus*) at Rome virtually revolutionized the entire estimate of manuscript authority. When Prof. W. Robertson Smith wrote, the effect of the use of these two manuscripts had not yet been fully manifest. The publication of the Greek Testament of Westcott and Hort and of the Revised English version of the New Testament (in 1881) mark the great advance. We may add that the *Prolegomena* to Tischendorf's Greek Testament have been edited by Prof. C. R. Gregory (now of Leipzig), the first part appearing in 1884. The Revised version conveys to the general reader the results obtained by the textual critics who have published the learned works just named. The principles and results may be briefly stated.

The Principles of Textual Criticism.—It has long been seen that the ancient authorities represent three groups of evidence: one from Alexandria, the second from the Western Church, and the third coming to us from Constantinople. The first seems to be the purest, the second is full of minor variations (in both Greek and Latin), but very valuable as indicating the origin of various readings. The third (called Byzantine, Constantinopolitan, and, in its older forms, Antiochian and Syrian) seems to have undergone more changes, owing to the attempts at harmonizing, smoothing, and polishing the text. The modern school of textual critics agree in giving more weight to the oldest manuscripts, and also in attempting a classification (or genealogy) of the various forms of the text. On this theory of evidence the immense number of later cursive manuscripts loses its weight. It is further agreed that each variation must be separately discussed, and that only when the authorities are nearly of the same weight should internal grounds be considered.

But Westcott and Hort have developed a fuller theory. They accept four groups, one named by them "neutral," representing the earliest form of transcribed text accessible to us. The chief authority in this group they claim is the *Codex Vaticanus* (B). They also accept the view that the Syrian text is later than the others, having undergone a revision in the third century. Hence that it is of little value when not agreeing with any of the others, but very useful in enabling us to choose between variations in the pre-Syrian texts. Practically their theory makes B outweigh all other authorities, and their Greek Testament rarely omits to notice the readings of B, even when they are not placed in the text. The views of Westcott and Hort have been strongly opposed, and the two weak points (a neutral group, and a Syrian revision) have been objected to by those who accept in the main the practical results of their labors. On the other hand Tischendorf, while presenting a text nearly agreeing with Westcott and Hort, is too apt to follow Aleph (his own discovery), and in the Gospels to adopt readings that differ from the parallel passages. Yet Tregelles, Tischendorf, Westcott and Hort, with most modern scholars, are in substantial agreement as to the defects of the received text and the weight of the older authorities.

The Revised Version does not follow any one of these editors. The questions of text were discussed in both the English and American companies, only so far as they could affect the English rendering. No attempt was made to revise the Greek text as such; but the Revised New Testament, as may readily be seen, accepts in the main the judgment of the textual critics named above. It is probably nearer to Tregelles than to Tischendorf, and nearer to Westcott and Hort, though often dissenting from the latter. More remains to be done; yet there can be no question

that there is now greater agreement among experts in this department than ever before. It is quite significant that recent German scholars have recognized the great value of the text of Westcott and Hort. The so-called conservative school of critics, who uphold the Syrian text, often urging that it has been endeared to so many generations of Christian people, must necessarily fight a losing battle. The modern textual critics are not attempting to do anything else than to restore the *ipsissimum verbum* of the word of God.

Conclusion.—The great progress in textual criticism, far from weakening our confidence in the New Testament, confirms it. (1) The positive evidence of the care bestowed upon the text and its substantial purity show that we can trust it as we can no other ancient literature. (2) The number of variations has helped, not hindered, the establishment of a correct text on adequate evidence. (3) The spirit in which textual criticism has been conducted is in sharp contrast with the wild theories of the "higher criticism." The former has been investigated in a purely scientific, yet reverent, method. (4) The Christian public has not yet accepted the results as embodied in the Revised New Testament. But this should not be regarded as discouraging. It was several centuries before English Biblical scholars dared to question the accuracy of the so-called Received Text (Stephens, 1550).

A long process of education as to the basis of the correct text will be required for the general Christian public. That the truth will ultimately win we cannot doubt, especially in view of the present movement toward popular study of the Bible. (M. B. R.)

NEWTON, JOHN, engineer and general, was born at Norfolk, Va., Aug. 24, 1823. He graduated at West Point in 1842 and entered the U. S. engineers. He was engaged chiefly in the construction of fortifications on the Atlantic and Gulf coasts until the outbreak of the civil war. In 1861 he was chief engineer of the departments of Pennsylvania and the Shenandoah until August, when he was made brigadier-general of volunteers and commanded the defenses of Washington. In McClellan's Peninsular campaign Gen. Newton was engaged at Gaines' Mills and Glendale, and afterwards at South Mountain and Antietam. At Fredericksburg, Dec. 13, 1862, he commanded a division, and in March, 1863, was promoted major-general. During the battle of Chancellorsville he stormed Marye Heights, May 3, 1863. At Gettysburg he succeeded to the command of the First corps, July 2, 1863, which he held until March, 1864, when he was transferred to Gen. Sherman's command. He took part in the Atlanta campaign, and afterwards held commands in Florida until 1866, when on the reduction of the army he returned to the engineer corps with the rank of lieutenant-colonel. He became colonel in 1879 and chief of engineers in 1884. Among the important works conducted by him were the removal of the obstructions at Hell Gate and other points on East River, the improvement of Hudson River, and of the channel between Staten Island and New Jersey (See **HELL GATE IMPROVEMENTS**). The final explosion at Flood Rock took place Oct. 10, 1885, and thereafter Gen. Newton was engaged in improvements of the channels around New York until his retirement on Aug. 27, 1886. A year later he was appointed commissioner of public works in New York city.

NEW YORK. This State, by its population and wealth, still justifies its claim to the title of the "Empire State." The last federal census shows, that having a population of 5,082,871, it surpassed Pennsylvania (the second State) by 799,980, and Ohio (the third State) by 1,884,809. It is entitled to 34 members of the U. S. House of Representatives. Together with Vermont and Connecticut it forms the second judicial circuit of the United States; and it is itself divided into southern, northern, and eastern judicial districts of the same court. There is a U. S.

marshal and a district attorney for each judicial district.

The first governors entered upon their office on July 1st following their election; but since 1823 the date has been Jan. 1. The term of office was two years down to 1879, since which date the term has been three years. The lieutenant-governors have been chosen at the same elections with the governors, and their terms of office have been the same as those of the governors.

Every alternate year the following State officers are elected by the people: comptroller, treasurer, attorney-general, secretary of state, and State engineer and surveyor. The secretary of state keeps the State archives, and is custodian of the great seal of the State, which (by recent enactment, 1883) has been carefully defined.

Finances.—The report of the State treasurer for 1888 showed that there was a balance of \$3,378,540.36 in the treasury, Jan. 1, 1888. The following table shows the receipts and disbursements for the fiscal year ending Oct. 1, 1887:

	Receipts.	Payments.
General fund.....	\$9,526,251.91	\$8,599,886.10
Common school fund.....	298,084.80	254,519.16
College land scrip fund...	21,439.07	5,569,827.49
Literature fund.....	313,766.32	310,554.51
Military record fund.....	2,881.73	344,023.85
U. S. deposit fund.....	358,727.80	19,327.63
Free school fund.....	3,717,749.68	1,574.71
Canal fund.....	3,590,523.80	3,671,735.53
Woman's monument fund.	42.00	
Total.....	\$17,829,467.11	\$16,771,448.98

There was received from the earnings of the State prisons during the year, \$1,111,823.59; State tax, \$5,805,400.78; tax on organization of corporations, \$201,663.99; corporation tax, \$1,239,864.16.

The comptroller valued the investments at the close of the fiscal year as follows: common school fund, \$3,930,657.39; U. S. deposit fund, \$4,017,220.71; literature fund, \$234,201.30; college land scrip fund, \$474,409.12; canal debt sinking fund, \$4,061,188.84. Total, \$12,767,677.36. Recent laws have authorized the investment of the money of various State funds in the public securities of the villages, towns, cities, and counties of this State. The wider range of investments thus sanctioned has made it practicable to secure substantially better rates of interest than could otherwise have been obtained. At the same time the use of these moneys in the discriminating purchase of local securities has inured to the benefit of thriving and solvent cities and villages. For 1888 the State tax is \$9,075,046.08, the rate being 2½ mills, and the valuation \$3,361,128,177, the tax to be devoted as follows: school purposes, \$3,697,240.99; canals, including canal debt, \$2,352,789.73; general purposes, \$3,025,015.36. Total, \$9,075,046.08. The direct school tax for 1887 produced \$3,708,384.69. The total expenditure from the State treasury for educational purposes was \$4,152,874.65. The total expenditure, State and local, for the maintenance of schools was \$14,461,774.94. Setting aside the general fund debt for Indian annuities, the principal of which amounts to but \$122,694.87, the gross State debt upon Sept. 30, 1887, was \$7,444,310, of which sum \$800,000 is the amount outstanding of the debt created to provide for the payment of the Niagara Reservation awards in 1885, which mature at the rate of \$100,000 per annum. The remaining \$6,644,310 is the canal debt, the last of which matures in October, 1893, and which has been reduced during the fiscal year by \$1,660,200. The receipts

from taxes upon corporations have been somewhat reduced by smaller revenues from insurance companies. A new law, imposing a tax of 5 per cent. upon the gross receipts for admission to race-tracks, brings about \$25,000 into the treasury, which amount is disbursed by the State Agricultural Society in the form of prizes for improving the breeds of cattle, sheep, and horses at the various county fairs throughout the State. The interest derived from State funds largely exceeds \$200,000. The prosperity indicated in State affairs and the reduction of the indebtedness to so insignificant a point have not been attained by any sacrifice of substantial interests, or by unduly withholding effort in any direction. On the contrary the past four years comprise a period of peculiar and wise liberality in certain respects. The gross amount appropriated from the general fund during those years for land purchases and for construction of buildings exceeds \$8,500,000. This sum is the more notable as construction appropriations for the new capitol have been less lately than in former years, the amount for the four years in question being \$2,254,000. Of the remainder \$1,500,000 were expended in the purchase of the Niagara Park Reservation. There remain, therefore, \$4,500,000 appropriated in four years to purchase land or for construction for charitable, penal, military, educational and general purposes—canal construction and purchases not being included in this enumeration. Among the more important recent appropriations are: \$300,000 for a new asylum for insane criminals; \$190,000 for the Hudson River State Hospital (popularly known as the Poughkeepsie Asylum); \$190,000 for the asylum just projected at Ogdensburg; \$120,000 to rebuild the female department of the State Industrial School at Rochester; \$300,000 for State Prison repairs; and \$173,000 for additions to the Buffalo Asylum. Expenditures of this sort are used to better advantage than was true twenty or more years ago. Certain charitable institutions then constructed represented an outlay of from \$2000 to \$3500 for each inmate who could be properly accommodated in them. Recently similar institutions and buildings have been projected or erected at a cost of from \$320 to \$800 for each inmate, the provision made in these latter instances being more than equal to that furnished by the earlier institutions or edifices.

Assessment.—Since 1883 the assessment of real estate has increased from \$2,557,218,240 to \$3,025,229,788 in 1887, or \$468,011,548. Since 1883 the assessment of personal estate has increased from \$315,039,085 to \$335,898,389 in 1887, or \$20,859,304. The valuation of taxable property in 1867 was \$1,664,107,725; the gross valuation in 1887 was \$3,361,128,177—increase in 20 years, \$1,697,020,452. The valuation of taxable personal property in 1867 was \$436,404,633; the valuation in 1887 was \$335,898,389—decrease in 20 years, \$100,506,244. The valuation of taxable real property in 1867 was \$1,237,703,092; the valuation in 1887 was \$3,025,229,788—increase in 20 years, \$1,787,526,696. The State tax levied for all purposes in 1867 was \$12,647,218.71; in 1887 was \$9,075,046.08—decrease State tax in 20 years, \$3,572,172.63. The total amount of State taxes paid by the taxable property from 1867 to 1887, both inclusive, is about \$224,000,000; the total amount paid by personal property, \$37,000,000—taxes paid by real estate in 20 years, \$187,000,000. Average yearly State tax paid by the personal property in 20 years 16.52 per cent. Average yearly State tax paid by the real estate in 20 years 83.48 per cent.

Canals.—These important public works of the State during the year 1887 had accommodated a tonnage over 5,553,805. For 1884 the tonnage was 5,009,488; 1885, 4,731,784; for 1886 it was 5,293,982. These figures show that the canal system of the State still retains its usefulness. The tonnage for 1887 was composed as follows: Forest products, 1,529,809; agricultural products, 1,590,509; manufactures, 212,216; merchandise, 378,734; other articles, 1,842,537. Of this total,

3,968,767 tons went east; and 1,585,038 tons went west. The total tons carried by the several canals are as follows: Erie, 3,840,513; Champlain, 1,229,335; Black River, 111,847; Cayuga and Seneca, 195,933; Oswego, 176,177. The Legislature of 1887 appropriated \$550,000 to double the capacity of the locks by making each one as long again as it is at present. A similar appropriation was passed in 1888. Six locks on the Erie, near Syracuse, and two locks on the Oswego have been completed, and nearly all the rest are under contract. The original Erie Canal was completed in 1825, with a capacity for boats carrying 100 tons. Between 1836 and 1862 the prism was deepened so as to allow the passage of boats carrying 240 tons. The following canals, lateral to the Erie, were completed at the respective dates given: Cayuga and Seneca, 1828; Oswego, 1828; Chemung, 1831; Crooked Lake, 1833; Chenango, 1836; Black River, 1849; Oneida Lake, 1856; Genesee Valley, 1856. Some of the lateral canals are now abandoned.

Railroads.—The railroads of New York are under the supervision of a board of Railroad Commissioners, created by a law of 1882. The commissioners are appointed by the Governor and confirmed by the Senate. Much of the care and responsibility devolving upon this board has been removed by the appointment of U. S. Railroad Commissioners, under the Inter-State Commerce law. The State board of New York has paid particular attention to accidents. It finds that the principal cause of death and injury to passengers was getting on or off trains in motion, and was the result of their own want of caution. Employes most frequently met death by walking on the track. Experiments were made with patent couplers so as to ensure the safety of brakemen. The Legislature has not seen fit to pass the recommendations of the board in favor of crossings either above or below grade. Bridges have been closely inspected by the board; and attention has been called to the desirability of a uniform code of rules and signals. The elevated railroads of New York have voluntarily reduced their fares to 5 cents. On and after Nov. 1, 1888, it is required that all cars shall be heated with steam from the engine, and that stoves shall be no longer allowed.

The total number of miles of railroad track in New York is 12,035; locomotives, 3972; passenger cars, 4486; freight cars, 148,120; passengers carried, 81,463,709; passengers carried, reduced to a one-mile uniformity, 1,839,734,634. Total stock and debts, \$59,535,294; earnings, \$17,801,464; net earnings, \$4,242,279.

Banks.—The total amount on deposit Jan. 1, 1888, was reported as follows: Savings banks, \$590,458,751; banks of discount and deposit, \$193,324,267; trust companies, \$200,087,230.17; safe deposit companies, \$4,214,504.97. Total, \$988,084,753.14. One hundred and twenty-five savings banks were in existence Jan. 1, 1888, of which 7 were inactive. The total amount of resources of the saving banks of the State on the morning of Jan. 1, 1888, was \$590,458,751; Jan. 1, 1887, \$568,286,867; showing a net increase for the year of \$22,171,884. The increase during the year 1886 was \$33,750,234, and during the year 1885 it was \$28,609,137. On Jan. 1, 1878, the total amount of resources of the savings banks of the State was \$346,726,202, showing a net increase in ten years of \$243,732,549. The total estimated value of real estate held by savings banks of the State Jan. 1, 1888, was \$7,736,103. Of this amount \$6,730,439 represented the aggregate estimated value of bank buildings. The remaining amount, \$1,005,664, is the estimated value of real estate which had been acquired under foreclosure proceedings. On Jan. 1, 1888, the savings banks held \$5,776,048 in cash, and had \$33,630,607 deposited with State and national banks and trust companies incorporated under the laws of this State, making a total of \$39,406,650. On Jan. 1, 1887, it was \$36,632,120, indicating an increase of \$2,774,530. The deposits

held by the savings banks of the State on Jan. 1, 1888, amounted to \$505,078,751. On Jan. 1, 1887, they were \$482,486,730, showing an increase during the year of \$22,531,021, which sum includes \$16,731,002 of accumulated interest which was credited to depositors, leaving a net increase of deposits during the year of \$5,800,019. During the year 1887 the savings banks received \$179,021,049 from depositors, and paid to them \$173,070,683. A constant effort is making to enlarge the scope of investments for savings institutions. In 1887 a law was passed changing the legal status of building and loan associations and their mode of doing business. Among the amendments is one which allows such associations to do a savings bank business upon proper guarantees to the superintendent of the banking department. The number of banks of deposit and discount operated under the State laws is greater at the present time than it has been at any period subsequent to March 9, 1865, the date of the passage by the Legislature of the act enabling the conversion of State banks into national banks. Since Oct. 1, 1886, the unprecedented number of 16 new State banks has been organized and entered upon active business. On Oct. 1, 1887, the total of loans and discounts in State banks was \$115,042,599, out of the total resources, \$190,954,547. Among the liabilities were: aggregate capital, \$23,330,700; surplus, \$7,484,780; undivided profits, \$6,831,848; due to depositors, \$129,035,151. During 1887 the aggregate resources of the banks increased \$11,707,273; the increase in deposits was \$8,618,499; in loans and discounts, \$4,502,888, and in capital, \$1,235,000; the increase in surplus fund was \$839,188, and in undivided profits, \$788,173; the increase in cash items was \$6,332,801; the amount due from directors increased \$721,528; overdrafts, \$11,244; amount due from trust companies, State, national, and private banks and brokers, \$936,421, and U. S. legal-tender notes and circulating notes of national banks, \$488,876; the increase in bonds and mortgages was \$59,857, and in amount due to trust companies, State, national, and private banks and brokers, \$129,433; in miscellaneous liabilities, not classified, there was a net increase of \$232,994, and in loss and expense, \$13,368. During 1887 the net decrease in specie was \$869,968, and in stocks and bonds, \$408,898; the decrease in real estate was \$17,492. The amount due to the treasurer of the State of New York decreased \$21,674, and the amount due individuals and corporations other than banks and depositors, \$114,333. The net increase in the capital stock of banks, banking associations, and individual bankers was \$1,235,000. Of this amount \$870,000 was capital of new associations; \$400,000 resulted from the increase of the capital stock of the Bank of the State of New York from \$800,000 to \$1,200,000.

Insurance.—A law of 1887 reduced the number of poor co-operative and assessment life and casualty companies, and thus improved the quality of those that remained. It was also required that all fire policies written in the State shall hereafter be of a uniform style and printed in large type. For 1887 the net increase in life companies was 81,372 in policies, and \$252,081,384 in insurance. The number of such companies is 29, having assets, \$595,679,478; reserve, \$516,966,750; surplus, \$72,427,666. The number of fidelity and casualty companies is 10; assets, \$7,738,512; reserve, \$2,516,933; surplus, \$1,162,130. The number of co-operative companies is 171; assets, \$10,829,468, and total liabilities, \$4,654,823. There are 166 fire companies; assets, \$297,159,925; surplus, \$57,559,780. The number of marine companies is 16, with assets, \$22,286,114; surplus, \$14,250,457. A law of 1884 has now become operative requiring that the standard for the valuation of life policies and obligations shall be the actuary, or combined experience table of mortality, with interest at 4 per cent. per annum. Companies of other States are treated with the same measure that they render to New York companies in their respective

States. Assessment associations are now required to file their preliminary papers with the superintendent of the insurance department. A comparison of the business done in 1887 shows that the fire and marine companies fell away nearly \$1,400,000. The fire premiums received were \$18,425,955.69; fire losses paid, \$13,419,011.99; fire losses incurred, \$13,937,470.98. The estimated amount of expenses for the transaction of this business is \$5,527,786.72, which, if added to the incurred losses, makes a total of \$19,465,257.70, showing as compared with the premium receipts an apparent loss of \$1,039,302.01.

Prisons.—Three prisons are in operation: Sing Sing, having 1425 convicts in the year 1887; Auburn, 1111; and Dannemora, 760. Female convicts are sent to the several county penitentiaries. Under the contract system (by which the labor of every convict brought to the State an average of 40 cents per day) the prisons had more than sustained themselves in the years between 1881 and 1886. But since the passage of the law abolishing contract labor there has been a deficit—that for 1887 having been \$60,049, and that for 1888 being still greater. A commission appointed in 1886 to investigate and recommend a substitute for contract labor gave nothing practical in its report. In the meantime the labor agitators had demanded still further concessions, and the State account system (the successor of the contract system) was also abolished. Then it was enacted, at the extra session of the Legislature of 1888, that no machinery whatever should be used in the prisons, and that all the output should be of articles and materials for use in the several institutions of the State. This has resulted in the idleness of thousands of the convicts.

Labor Matters.—In 1883 a bureau of the statistics of labor was established under a commissioner who is charged with the duty of collecting and presenting to the Legislature statistical details as to strikes and all other phases of labor, together with the cause of the same. The later reports of the commissioner show that strikes have diminished in number. In 1886 there was created a board of three commissioners of mediation and arbitration to hear and consider appeals from local boards, and to investigate such cases. The board may subpoena witnesses, but it has no power to decide a dispute. Still it is claimed that the board has exercised a deterrent influence upon elements that otherwise would have made much more of a disturbance; and to its action is attributed the decreased number of strikes. In fact, many of the difficulties that arose were amicably settled between the employers and the employed after a brief hearing before the board.

The civil service is in charge of a board of three commissioners. Elaborate reports have been made, but it must be confessed that the reform cannot be carried on until the board is made absolutely independent of the Governor, at whose will each member retains his office.

Sanitary Affairs.—A State Board of Health has been in existence since 1880. Great progress has been made in examining the drainage and sewerage of unhealthy localities; and also in applying scientific principles to the choice of water supplies. The advances of cholera and yellow fever are closely watched by the board. Many specimens of beer and adulterated food and drugs have been analyzed and reported as evidences for prosecution before the law. The department relating to vital statistics has been greatly improved and every case of virulent or contagious disease has been examined with care. It is recommended that the Quarantine station, in New York harbor, be demolished, and that the cottage plan be substituted.

Charitable Institutions.—The institutions subject to the visitation of the State Board of Charities are as follows: 1. Those established and conducted by the State; 2. Those provided for and supported by counties and cities; and, 3. Those under the direction and management of incorporated benevolent organizations.

The first comprises hospitals and asylums for the insane, institutions for the blind, deaf and dumb, disabled soldiers and sailors, idiotic and feeble-minded, and houses of refuge and reformatories; the second, county and city poor-houses and alms-houses, with their infirmary and insane departments; and the third, orphan asylums and homes for the friendless, and special and general hospitals and dispensaries. The administration of out-door medical and other poor relief devolves upon the local officers of the poor of the various counties, cities, and towns, and the expense of this mode of relief is levied and raised by tax assessed upon these localities. The appraised value of the property held for charitable and correctional purposes, Oct. 1, 1887, was \$53,742,535.58 as against \$52,138,192.45, as appraised Oct. 1, 1886, viz.: By the State, \$11,187,649.80; by counties, \$2,751,894.86; by cities, \$4,348,500; by incorporated benevolent associations, \$35,454,490.92. Their reported indebtedness then was \$3,191,097.97 as against \$3,161,994.81, their indebtedness Oct. 1, 1886. The reported total receipts for charitable and correctional purposes in the State, for the fiscal year ending Sept. 30, 1887, were \$13,635,305.95, as against \$13,362,659.61, the receipts for the previous year being an increase of \$272,646.34, derived from the following sources: From the State, \$1,412,283.95; from counties, \$1,843,588.18; from cities, \$3,292,769.50; from individuals for the support and care of inmates, \$751,295.49; from contributions, donations, and legacies, \$1,558,934.72; from the income on investments, \$483,745.09; from all other sources, \$4,292,689.02. The reported total expenditures for charitable and correctional purposes in the State for the year ending Sept. 30, 1887, were \$12,574,074.67, as against \$12,027,990.01, the expenditures for 1886, or an increase of \$546,084.66. The number of beneficiaries in the care of the various charitable and reformatory institutions of the State, Oct. 1, 1887, was 63,816.

Education.—The educational interests of the State are in charge of the Board of Regents of the University, which has been in existence more than a century. The regents are authorized to incorporate colleges and academies, and have established uniform conditions on which such incorporation is granted. They inspect the academies of the State, prescribe rules for rendering their returns, apportion the moneys annually distributed among them, and report to the Legislature the statistical returns of colleges and academies, with such other information and recommendations as they may deem proper. Since 1844 they have been trustees, *ex-officio*, of the State Library, and since 1845 trustees of the State Museum of Natural History. They appoint the librarians and assistants of the State library, and the staff of the museum. They appoint the executive committee of the State Normal School at Albany, in concurrence with the superintendent of Public Instruction, who is chairman by virtue of his office. They are authorized to confer annually the degree of M. D. upon four persons nominated by each of the State Medical Societies, and may confer any degree above that of A. M. at their discretion. They are also authorized to appoint boards of medical examiners, and on their recommendation to confer the degree of M. D. Under the rules for admission to the bar they hold examinations and give certificates on subjects required, as preliminary to legal studies. The superintendent of Public Instruction has the oversight of the public schools. He also appoints State pupils to the institutions for the instruction of the deaf and dumb and the blind, and visits and inquires into the condition and management of these institutions. He apports among the counties the number of pupils in the State Normal School to which each is entitled. He has charge of all the Indian schools in the State; employs local agents to superintend them and visit them, and directs concerning the erection and repairs of their school-houses, and determines the branches of

instruction to be pursued in the schools. Normal schools are located in the following places: Albany, Brockport, Buffalo, Cortland, Fredonia, Genesee, New Paltz, Oswego, Potsdam, Oneonta. Laws have recently been passed enlarging the powers of the superintendent, and also requiring much more strict examinations before diplomas are issued. Graduates of colleges and kindred institutions are allowed diplomas without severe examination. The superintendent has completed an extensive work containing designs for cheap school-houses; and the book has been adopted by the commissioners of the National Bureau of Education. The income for public schools in 1887 was \$16,433,128. Of this amount there was expended: For teachers' wages, \$9,306,425; school-houses and sites, \$2,394,004; libraries and apparatus, \$400,000. The number of school districts is 12,072; teachers, 22,708; children between 5 and 21 years of age, 1,763,115; children attending school, 1,037,812; log school-houses, 55; frame school-houses, 10,128; brick school-houses, 1420; stone school-houses, 363. Total number of school-houses, 11,966.

Militia.—The military code provides that the "aggregate force" of the National Guards "in times of peace, fully armed, uniformed and equipped, shall not be less than 10,000 and not over 15,000 enlisted men." In 1887 the force consisted of 726 officers and 11,909 enlisted men, aggregating 12,635. The aggregate now approximates 13,000 officers and enlisted men. The inspector-general reported that there were present at the annual inspection and muster 10,444 officers and enlisted men. There are 15 regiments, 1 battalion and 44 separate companies of infantry, and 5 batteries of artillery, organized as 4 brigades. Armories and arsenals have been erected in the following places: Buffalo, Rochester, New York, Utica, Syracuse, Auburn, Oswego, Watertown, Brooklyn, Newburgh, Kingston, Binghamton, Troy, Flushing, Oneonta, Elmira, Walton. The following armories are now to be erected, under recent acts of the Legislature: Saratoga Springs, Mount Vernon, Hoosick Falls, Albany. The Remington rifle is still in use; but it is likely to be superseded with rifles of a smaller calibre, such as are used by the U. S. army. A State camp of instruction has been established at Peekskill, in which nearly half of the militia are instructed every year. Recent reports show that, in the civil war, the State of New York furnished one-sixth of all the troops comprising the Union army. During that war the State furnished 20 major-generals and 97 brigadier-generals, and 65 New Yorkers were brevetted major-generals, and 220 brigadier-generals of volunteers, and 115 received the U. S. medal of honor for bravery and distinguished services in the field. In the numbers brevetted only those who did not obtain the full rank are included.

Judiciary.—In 1846 the present Supreme Court was constituted to exercise the powers of the Supreme Court, the Court of Chancery, and the Circuit Court, as exercised at that time. This court has general jurisdiction in law and equity. There are 8 judicial districts, each one of which has 5 justices, who are elective. The district comprising New York city is entitled to 2 additional justices. The salary is from \$6000 to \$8500, with an allowance of \$1200 for expenses. General and special terms of this court are held. The court of last resort is known as the Court of Appeals. This consists of 7 judges, elected by the whole people of the State, one of whom shall be chief-justice. The salary is \$10,000, with \$500 additional for the chief-judge. The term of office in this court and the Supreme Court is 14 years, with disqualification at the age of 70. The Court of Appeals has full power over all decisions of the Supreme Court. A quorum is 5 judges, and 4 must concur in order to pronounce a judgment. The Legislature may advance any case from the Supreme Court directly to the Court of Appeals.

Indians.—There are 9 reservations controlled by the State and occupied by Indians, of whom there are

4707. Efforts have been made periodically by interested parties outside to have the State divide the lands in severalty among the Indians, the outsiders lying in wait to secure the property. This has not been done, but a commission has been appointed to examine into the best method of disposing of the reservations and of caring for the Indians generally.

Census.—The Constitution of the State requires a census every ten years, which shall be taken midway between the decennial censuses of the United States. The last State census was taken in 1875—population, 4,698,958. The U. S. census of 1880 gave 5,082,871. No census was taken in 1885, because the governor refused to sign a bill relating to the census presented to him by the Legislature of that year. The governor called the Legislature together in extraordinary session to pass another bill. The Legislature gave him the same bill, which he once more refused to sign, and no bill has been presented to him since that date. The probability is that there will be no State census till 1895. A new census would give the cities of New York, Brooklyn, and Buffalo a much larger representation in the Legislature, and the opposition to any census is led by the rural districts, which fear a reduced representation. The Senatorial districts still number 32, and the Assembly (or popular branch) districts number 120. If the Senatorial and Assembly districts were as small as they are in the States of New England, the Legislature would have about 1200 or 1500 members, instead of the 160 established by the constitution.

Boundaries.—Slight controversies relative to the outlines of the State led the Legislature of 1867 to direct the regents of the university to examine and ascertain the true location of its boundaries. A law of 1875 empowered the regents to act in accordance with the resolution, and also (in connection with the authorities of Pennsylvania and New Jersey) to replace any monuments that had been removed. In 1880 the regents were authorized to select three of their number to confer with commissioners empowered to act for the States named. Under the provisions of this law the boundary line with New Jersey was completed in 1882, and that with Pennsylvania in 1885.

Cities and Counties.—There are 30 cities in the State, as follows: Albany, Amsterdam, Auburn, Binghamton, Brooklyn, Buffalo, Cohoes, Dunkirk, Elmira, Hornellsville, Hudson, Ithaca, Jamestown, Kingston, Lockport, Long Island City, Middletown, Newburgh, New York, Ogdensburg, Oswego, Poughkeepsie, Rochester, Rome, Schenectady, Syracuse, Troy, Utica, Watertown, Yonkers. The city of Amsterdam was incorporated by the Legislature in 1887, and the cities of Hornellsville, Ithaca, and Middletown in 1888. All of the cities, with the exception of Hornellsville and Middletown, have a population of over 10,000. The counties still number 60; but there is a movement to create Lincoln county out of portions of several counties to the south and west of Rochester, and Susquehanna county near the headwaters of the river of that name to the west of Cooperstown. The county of the largest area is St. Lawrence, 2880 square miles; and the county of the smallest area is Richmond (Staten Island, in New York harbor), 59 square miles.

Centennial Celebrations.—Appropriate notice was taken of the several battles and the leading civic events of the war of the American Revolution that took place within the boundaries of the State. The centenary of the adoption of the Constitution of the State was celebrated at Kingston, where the first State government was formed, on July 30, 1877. The original Senate house is still in existence. A celebration of the battle of Oriskany (wherein the American general, Nicholas Herkimer, stopped the British advance of St. Leger and the Six Nation Indians to meet Burgoyne near Albany) took place upon the battle-ground near Utica, Aug. 6, 1877, and a monument was un-

veiled. On Oct. 17 of the same year the centennial of the battle of Saratoga (*q. v.*) took place on the battle-ground, and a monument has been erected upon the spot. The one-hundredth anniversary of the battle of Bemus Heights was celebrated Sept. 19th. A monument to mark the massacre was unveiled at Cherry Valley, Aug. 15, 1877. During the year 1879 the centennials of the advances and victories of Sullivan's expedition against the Seneca Indians were celebrated at Elmira, Waterloo, Geneseo, and Aurora. At the centennial of the promulgation of the Federal Constitution in Philadelphia, Sept. 17, 1887, New York was represented officially, and it will give especial attention to the centennial, in 1889, of the inauguration of George Washington as the first President of the United States. The 30th of April in that year has already been made a legal holiday. The centennial of the adoption of the Constitution of the United States by the State of New York was celebrated, at Poughkeepsie, July 26, 1888.

After the completion of the Senate chamber of the new capitol at Albany in 1881 (see ALBANY) the Senate staircase was completed and progress made upon the tower, but for several years no appropriations were made owing to a political quarrel between the governor and the Legislature. In 1888 \$275,000 were appropriated to take down the stone ceiling of the Assembly chamber (which had become unsafe owing to faulty construction) and to replace it with a ceiling of iron and wood; \$140,000 were also appropriated to finish the rooms set apart for the State library. The cost of the building to 1888 is \$18,000,000. The old capitol and State library were removed in 1883-4, and the Capitol Park has been laid out in harmony with the Academy Park adjoining.

Recently strict laws forbidding the manufacture or sale of oleomargarine have been enacted. Safeguards have been thrown about deer, fish, and other game in the Adirondacks and Catskills. Concessions have been made to the laboring men in various ways, including shorter hours on State work and the requirement that (for such work) stone must be cut where it is placed in position. A new law forbids the sale of liquors at or near county-fairs. Hanging is superseded by death from electricity, in capital cases, after Jan. 1, 1889.

(F. G. M.)

NEW YORK CITY. The province of New York was divided into 12 counties immediately upon its final conquest by the English in 1683. One of the 12 was New York. The original area of this county was much larger than the 39 square miles credited to it by the State census of 1875. A recent law has made the boundaries of the city of New York co-extensive with those of the county, and still more recent additions north of the Harlem River (known as "the annexed district") make the present area 41½ square miles. The State census of 1875 made the population 1,041,886; that of the United States in 1880, 1,206,299. No State census was taken in 1885; but a fair estimate gives the population in 1888 about 1,500,000. According to the census of 1880, 727,629 of the inhabitants were American born, and 478,670 of foreign birth. Of these, 198,595 were from Ireland, 29,767 from England, 8683 from Scotland, and 929 from Wales. Germany contributed 153,482; Italy, 12,233; France, 9910; Russia, 4551; Spain, 669. There were 17,937 New-Jersey-born New Yorkers; 11,055 from Pennsylvania; 10,589 from Massachusetts. Voters registered Oct., 1888, 286,547.

Government.—The present charter is a law of 1882, known as the "Consolidation Act." For a long time the mayor had almost absolute power of appointment, but later his power was very much restricted. A committee of the Legislature, in 1884, made a thorough examination of the government of the city, and recommended that the power and responsibility of the mayor should be increased; but the recommendation was

headed only so far as to give him power to appoint independently of the board of aldermen. As an outcome of the investigation of the Broadway street railroad franchise a law was enacted, in 1886, that the president of the board of aldermen (made elective in 1884) should be elected for two years, instead of for one year; and in 1887 it was enacted that the aldermen should number 25, exclusive of the president, and that they should hold office for one year. The board of police commissioners consists of 4 members, 2 of whom belong to each of the great political parties. It was organized as a non-partisan board, but as a matter of fact, from its very constitution, it is partisan. The patronage of the department is divided between the commissioners, and a large part of their business has been in the past to satisfy the claims of the two political parties whom they represent. The comptroller, the chief financial officer, was made elective in 1884; and the sheriff is likewise elective. The department of public works is administered by a single head appointed by the mayor, and removable for cause; and the department of charities and correction, under 3 commissioners, is constituted in the same way. The board of education consists of 21 commissioners, one-third of whom go out of office every year. The elections are held in November along with the general elections for State officers. For election expenses over \$200,000 are appropriated annually by the city.

Courts.—The amended judiciary article of the State constitution provides: "The Superior Court of the City of New York, the Court of Common Pleas for the City and County of New York are continued, with the powers and jurisdiction they now severally have, and such further civil and criminal jurisdiction as may be conferred by law." These courts were reorganized in pursuance of this article, under various legislative enactments, and by the laws of 1873 were termed "Superior City Courts," and were vested with original jurisdiction, at law and in equity, concurrent and co-extensive with the Supreme Court, of all civil actions, and of all special proceedings of a civil nature. Appeals are taken directly from these courts to the Court of Appeals of the State. The Court of Common Pleas of the City and County of New York is the oldest judicial tribunal in the State. It was continued under the constitution of 1846. The three judges in office when the amended judiciary article was adopted were continued, and the election of three additional judges was directed. The Superior Court of the City of New York was established by an act passed in 1828. It was the principal commercial court. Equity jurisdiction was conferred upon it by the judiciary act of 1847. Three justices were added in 1849, law and equity jurisdiction given, and cases were transferred to it from the Supreme Court.

The fire department consists of 84 steam fire-engines, 2 water-towers, 32 hook-and-ladder trucks, a life-saving corps, 1080 miles of fire-alarm telegraph, 980 alarm-boxes, 260 horses, and 1000 men. It costs \$1,700,000 a year. There are 73 companies, making 12 battalions, each under a chief of battalion (see FIRE). The police department has 35 precincts and station-houses, 75 patrol-wagons, 6 courts, and 3200 men (each getting \$800 to \$1200 a year). The head-quarters is at 300 Mulberry street, where is kept the "Rogues' Gallery" or photographs and records of notorious criminals.

Distances.—Battery to City-hall, $\frac{1}{4}$ mile; to Canal street, $1\frac{1}{2}$ mile; to Fourth street, 2 miles. Above Third street the blocks between the streets bearing numbers are 20 to a mile, and the blocks between the avenues are 6 to a mile.

Municipal Buildings.—Although having a spacious City-hall and court-house, in the City-hall park, New York pays over \$100,000 annually as rental for other offices. A new municipal building is projected, which will also be the terminus of the Brooklyn Bridge and the several railroads converging toward that point.

Finances.—The municipal debt in 1888 is

\$144,995,641. The assessed value of real estate in 1887 was \$1,254,491,849, a gain of \$50,550,784 in one year. Nearly half of this gain was above Eighty-sixth street. The total increase for six years, including 1887, was \$277,756,650. The assessed value of personal property in 1887 was \$246,508,151, an increase of about \$36,000,000. The total valuation in 1887 was \$1,500,000,000, an increase of \$400,000,000 in ten years. The city budget of 1888 was \$33,800,000, or \$2,000,000 greater than in 1887; and the rate of taxation was \$2.20 per \$100, as against \$2.16 in 1887. The following table shows the total amounts allowed for 1887 and 1888, and the appropriations, respectively exceeding \$1,000,000:

Objects and Purposes.	1887.	1888.
State taxes.....	\$4,258,527.93	\$4,064,179.24
Interest on city debt.....	7,391,814.39	7,116,171.54
Redemption of city debt.....	975,779.25	1,773,884.01
Public works.....	2,759,720.00	3,180,309.00
Park department.....	840,750.00	1,014,650.00
Charities and correction.....	1,498,300.00	2,343,372.00
Police department.....	4,235,867.06	4,415,255.66
Street-cleaning department.....	1,050,000.00	1,259,459.00
Fire department.....	1,804,765.00	1,976,492.00
Board of education.....	3,994,088.00	4,303,167.00
Salaries, judiciary.....	1,014,160.00	1,055,540.00
Asylums, etc.....	1,426,076.80	1,142,952.44
Totals.....	\$34,343,022.55	\$37,051,053.93
Less general fund.....	2,500,000.00	3,251,053.93
Total.....	\$31,843,022.55	\$33,800,000.00

Port-Officers.—The governor and the Legislature appoint certain officers to care for the port of New York. They consist of the health-officer, a captain, the commissioners of quarantine, the port-warden, and the harbor-masters. A law of 1883 abolished the fees of the captain and the harbor-masters; and a law of 1888 abolished the fees of the health-officer, which had occasionally reached \$100,000 in a single year. In place of the fees salaries were substituted. The State Board of Health has some control over this department, more especially in regard to the prevention of the importing and the spread of contagious diseases.

Steamships and Railroads.—The Cunard line has recently added to its fleet the Etruria, which has made the fastest time between Queenstown and New York—6 days, 1 hour, and 55 minutes. The Anchor line has added the City of Rome, the largest passenger steamer afloat. Her length is 560 feet and her breadth 52 feet. Her engines are of 8000 indicated horse-power, and are capable of being worked up to 15,000 horse-power. She has accommodations for 480 first-class passengers. To the Inman line has been added the City of New York, with longitudinal compartments and twin engines which are expected to secure great speed.

In 1883 what is known as the West Shore Railroad was constructed along the western bank of the Hudson River from Weehawken to Albany, and thence westward to Buffalo. The road is now under a long lease to the N. Y. Central Railroad. This road gives direct access from Washington and Philadelphia to Saratoga and the Adirondacks. The Baltimore and Ohio Railroad will have a terminus at Staten Island; and it promises quicker time to Philadelphia and Washington.

Street and Elevated Railroads.—There are over 40 lines of horse-cars in the city, with the uniform fare of 5 cents. The omnibuses which formerly crowded the streets have been removed, and there is but one line of stages, which runs up Fifth avenue to Seventy-second street. There are four elevated roads, viz., the Second, Third, Sixth, and Ninth avenue. All of them extend the length of the city, starting from South Ferry, which is at the extreme lower end. There are also branch roads to Brooklyn Bridge, the Grand Central depot, and other points. The speed of the trains is about 15 miles an hour. The fare on all the elevated

roads is 5 cents, with no extra charges for transfers to the branch lines. The reduction from 10 cents was made voluntarily.

Rapid Transit.—The resources of the elevated railroads are being taxed to their utmost, and relief is sought through another elevated railroad in Fifth avenue, the cable railroads already partially in operation in the northern districts, and more particularly by new roads under the surface. Of the latter there are three distinct plans. The first is the Arcade charter to construct an underground road through Broadway. The second is to build a road under Elin street, to the eastward of Broadway; and the third, that of the City Railway Company through the blocks to the westward of Broadway.

Bridges and Tunnels.—The Brooklyn Bridge (see BRIDGES, Fig. 90) has been completed at a cost of \$15,500,000; but the methods of its administration are not satisfactory. The length is 5989 feet, and it is 89 feet wide. It is suspended from 4 steel-wire cables, each 16 inches in diameter. In the centre is an elevated promenade, on each side of which is a railroad track for passenger-cars propelled by a stationary engine. Outside of the railroad track, on each side, are the roadways for vehicles. From the under side of the bridge, in the centre, to the water, is 135 feet. Ordinary vessels can easily pass beneath. Very large sailing-vessels have to lower their topmasts to go under. The fare for foot passengers is one cent, or if tickets are bought, one fifth of a cent. The single fare on the cars is 3 cents, or 10 tickets for 25 cents. A new bridge has been constructed across the Harlem River also (just above the High Bridge), near Two Hundredth street, to connect the upper districts. The tunnel under the North River has not yet been completed.

Parks and Streets.—The Central Park now covers 362 acres. Riverside Park, handsomely laid out, occupies the high bank of the Hudson, from Seventy-second to One Hundred and Thirtieth street, 3 miles long, and averaging 500 feet wide, with 178 acres of land, much of which has been improved. A driveway, cut into 4 broad sections by curbing ribbons of lawns and trees, sweeps over the hills and along the edge of the bluff, affording views of the Hudson River, Weehawken, Guttenberg, Edgewater, the Palisades, and upper Manhattan. On an elevation near the north end of the park is the brick tomb in which Gen. Grant's body was temporarily laid, Aug. 8, 1885. Morningside Park, a long drawn and nearly unimproved public ground of 47 acres, extends from One Hundred and Tenth street to One Hundred and Twenty-third street, near Tenth avenue, and has a costly and far-viewing driveway. It lies on the east side of the ridge which separates Harlem plains from the Riverside Park and Hudson River. In the "annexed district" parks known as "Pelham" and "Bronx River" have been laid out but not yet improved. The new streets and avenues of the city are laid out with the greatest regularity, and they are spaced according to the distances already noted.

Statues and Monuments.—The latest additions may be noted briefly. The obelisk which stood originally before the Temple of the Sun at Heliopolis, and was removed by Tiberius to Alexandria, was presented in 1877 by the Khedive of Egypt to the city of New York. It was successfully transported by Lieut.-Com. Henry H. Gorringe, U. S. N., the entire cost of the removal and erection being borne by the late William H. Vanderbilt. The bronze statue of the Indian Hunter and The Pilgrim, a picturesquely posed and attired heroic bronze statue, both by J. Q. A. Ward, stand in Central Park. Bartholdi's statue of Liberty Enlightening the World stands on Bedloe's Island, in the harbor. It is a female figure made of copper, 151 feet 1 inch high, standing on a pedestal 154 feet 10 inches high, and was presented by the French people to the people of the United States. In the upraised right hand is a torch, lighted by electricity, and in the

left hand is the Constitution. The copper is about one-fifth of an inch thick. The pedestal was built by popular subscriptions, and, with the statue, cost \$1,000,000.

Fine Arts.—The Metropolitan Museum of Art stands in Central Park, near Fifth avenue and Eighty-third street. The first movement towards founding the museum was made in 1869, and for some years its collections were kept in rented buildings. The present fire-proof brick and granite modern Gothic building, 218 feet by 95, was dedicated in 1880. New structures are building in connection. In the west-entrance hall are many fine pieces of statuary—Beer's medallion of Michael Angelo, the Apollo Belvedere, Hiram Powers's California, George Washington, Alexander I. of Russia, Roncanelli's Rose of Sharon, Albano's Thief from Dante's Inferno, Mozeir's Rispah, Fischer's Goethe, McDonald's Gen. Hancock, Schwanthaler's Dancing Girl, Marochetti's Washington, Houdon's Franklin, Connelly's Thetis, and many fine works by Barye, Barbedienne, Thorwaldsen, Reinhart, Canova, Launt Thompson, and others. On the southwest stairway is a collection of 43 water colors by William T. Richards, of New England coast and White Mountain scenes. The great hall contains many pieces of the famous Cesnola collection, from Cyprus, and various other interesting collections of rare objects of art. In the galleries are the collections of gold jewelry and Greek and Phœnician glass from the Cesnola treasure-trove; and also the Japanese, Egyptian, and Oriental porcelain and antiquities. In the western galleries are many of Kensett's exquisite landscapes, Gifford's and Durand's master-pieces, Frère's Oriental scenes, Couture's Decadence of Rome, Moignan's Outrage at Anagni, Madrazo's portrait of Robert L. Stuart, Bonnat's portrait of John Taylor Johnston, Meyer Von Bremen's genre pictures, Granet's Benedictines, Hellquist's great Swedish historical scene, Wylie's Death of a Vendean chief, William M. Hunt's Boy and Butterfly, Marr's Mystery of Life; landscapes by Cropsey, Inness, and Breton; Boughton's famous Judgment of Wouter Van Twiller, Schreyer's Arab scenes. The east gallery is devoted to pictures by the old masters—Baroccio, Albani, Titian, Correggio, Caravaggio, Tintoretto, Tiepolo, Sassoferrato, Bordone, Andrea del Sarto, Ghirlandajo, Rembrandt, Rubens, Jordaens, Hals, Van Dyck, Cuyp, Wouverman, Ostade, Teniers, Terburg, Breughel, Ruysdael, Steen, Velazquez, Murillo, Copley, Stuart, Trumbull, Jarvis, Eddy, Lely, Poussin. Many pictures in this remarkable collection have romantic histories, extending over centuries. Rosa Bonheur's Horse Fair, purchased at the Stewart sale for \$59,000, was presented by Cornelius Vanderbilt. The magnificent collection of paintings bequeathed to the museum by the late Catherine L. Wolf is in an annex building erected for its reception. The Lenox Library's Picture Gallery, at Fifth avenue and Seventy-first street, has about 150 fine paintings, including Munkacsy's Blind Milton dictating Paradise Lost to his Daughters, Turner's A Scene on the French Coast and Fingal's Cave, Horace Vernet's Siege of Saragossa, Gainsborough's A Romantic Woody Landscape, Andrea del Sarto's Tobit and the Angel, Delaroche's The Field of Battle, Church's Cotopaxi, Thomas Cole's Expulsion from Paradise, Bierstadt's Yosemite. There are portraits by Leslie, Stuart, Trumbull, Inman, Peale, Copley, Daniel Huntington, S. F. B. Morse, Healy, Pine, and others. The statuary includes Crawford's Sleeping Shepherd Boy and Children in the Wood, Rauch's Victory, Powers's La Penserosa, Ball's Abraham Lincoln, Sir John Steele's Sir Walter Scott, Trentanore's Napoleon.

Underground Wires.—A law of the State created a board of subway commissioners to take charge of placing underground the telegraph, telephone, and electric-lighting wires which had been heretofore strung overhead. The first commission having failed

to carry out its purpose, a law of 1887 reconstructed the commission with larger powers. The new board perfected plans which were designed to supply accommodations, on fair and impartial terms, to all companies and others duly authorized to make use of the same, affording the greatest possible convenience for placing, removing, repairing, altering, and connecting said conductors, combined with the least possible interference with the other uses to which the public streets are subject. Up to Jan. 1, 1888, 20,000 feet of trench had been excavated for telegraph and telephone service, and 900,000 feet of single ducts had been constructed, each duct averaging 80 wires. This represented about 14,000 miles of wire. Additional wires have been laid for electric light and power service. More than 1000 unsightly poles have been removed from the streets.

Aqueduct.—The inadequacy of the water supply of New York brought from Croton River over the High Bridge led to a law of 1883 creating an aqueduct commission to be appointed by the mayor. The commission was enlarged by a law of 1886. In 1887 a committee of the Senate examined into certain allegations of fraud and defective construction, and a third law was passed making the commission consist of the mayor, the comptroller, and the superintendent of public works, together with 4 citizens of the city to be appointed by the mayor. In 1884 it was decided that the aqueduct should have a conduit 14 feet in diameter. The work was begun in 1884, and it has since been decided to extend the terminus to Quaker Dam. The aqueduct runs under the Harlem River for safety in case of war or social disturbance. The length of the aqueduct will be 33½ miles, nearly all of which is completed. The cost thus far is \$10,000,000, and the total cost will approach \$20,000,000.

New Buildings.—The Produce Exchange, at the foot of Broadway, is built upon 15,000 piles and cost over \$3,000,000. The building is 307 by 150 feet in area and 116 feet high. The main hall is 220 feet by 144 feet and 60 feet high. The Mercantile Exchange has a new brick and granite building at Hudson and Harrison streets. The Cotton Exchange has a building of yellow brick at Hanover Square, south of Wall street. The College of Physicians and Surgeons has new and extensive buildings at Tenth avenue and Sixtieth streets, the gift of William H. Vanderbilt and his family. The reconstructed building of the Equitable Life Insurance Company in Broadway is considered the finest structure in the world for business purposes. Other buildings recently constructed are the Potter, the Mills, the Drexel, the Morse, the Stewart, and Temple Court.

Churches.—The Episcopalians now have 76 churches in the city; the Catholics about 60; the Methodists, 76; the Presbyterians, 55; the Baptists, 43; the Reformed (Dutch), 24; the Congregationalists, 8; the Universalists, 4; the Unitarians, 2. St. Patrick's cathedral, probably the most magnificent church in the United States, was projected in 1850 by Archbishop Hughes and the plans drawn by James Renwick. The corner-stone was laid in 1858; and on May 25, 1879, the cathedral was dedicated by Cardinal McCloskey. It has cost over \$2,000,000. It is in thirteenth-century decorated Gothic, the material being fine white marble. It is a Latin cross 306 feet long and 120 feet wide (140 at transepts) and 108 feet high, with a noble clerestory upheld on long lines of clustered marble columns and carrying a lofty and richly ornamented ceiling. On each side of the front gable, which is 156 feet high, the carved and pinnacled spires are to be carried to a height of 328 feet.

Theatres.—Among the places of amusement lately built is the Metropolitan Opera House at Broadway and Thirty-eighth street. It is capable of seating 6000 persons, the dimensions being 200 by 260 feet. The Casino, at Broadway and Thirty-ninth street, is a Moorish structure set apart for comic operas. The

new Broadway Theatre is also among the most attractive buildings of the city.

Club Houses.—The new Union League Club House, at Fifth avenue and Thirty-ninth street, cost \$400,000. The Athletic Club building, at Sixth avenue and Fifty-fifth street, is the most splendidly appointed building of its kind. (F. G. M.)

NEW YORK CITY, UNIVERSITY OF. This institution of learning owes its origin to a desire that arose in the beginning of the second quarter of this

century in certain merchants, bankers, and professional men of New York to secure—the language of a conference of nine gentlemen held December 16, 1829, is here quoted—"the establishment of a university in the city of New York on a liberal and extensive scale." In answer to the call of this conference a public meeting was held Jan. 6, 1830, in the rooms of the Historical Society, by which a standing committee on subscriptions was organized. On the following Oct. 15th the subscribers of money for the new foundation sought incorporation and chose a council to represent them. The incorporation of "the subscribers and shareholders" was granted by the Legislature April 18, 1831, under the title of "The University of the City of New York." The charter then granted provided that, besides thirty-two shareholders, the council should include the mayor and four members of the common council of the city of New York; that every year one-fourth of the council should go out of office, their successors to be elected by the whole body of shareholders, and that no one religious sect should ever have a majority of the board or council. The history of this country was then not far enough written to show these three things: 1. That to expect any care of higher education by public officials is to be deluded, unless the foundation is to be wholly controlled by the State, a control undesirable in the American republic; 2. That to plan a university as a joint-stock company to yield material dividends is to disfigure charity; 3. That to ask citizens in general to endow a foundation and yet to forbid to those citizens who open their purses the controlling voice is to dam up benefactions.

These three truths became manifest to all the friends of the university, and in 1883 three amendments to the charter were secured: (1) Abolishing the connection of the city government with the council; (2) Constituting the council the sole shareholders and corporation, giving to this body the election of a new class of eight members every year to succeed the class whose terms expire; and (3) expunging the denominational test by allowing members of council to be chosen without regard to their church affiliations.

The university thus assumes a position in harmony with the American idea, that higher education is to be offered by voluntary corporations as a loan to the youth of the country, to be repaid by them as educated citi-

zens and members of the liberal professions. The council of the university, as now constituted, is about equally divided between members selected from the alumni and from the whole body of citizens.

The plan of the university in the minds of its founders was broad and far-seeing. Hon. Albert Gallatin, president of the council in 1831, said in a public meeting, Oct. 20, 1830, as to the chief objects of the university: "One is to complete the studies commenced in the colleges, . . . another is to diffuse knowledge." The early statutes contemplated a department of arts and science, corresponding to the faculty of philosophy in a German university, a department of medicine and a department of law. The first department it was intended should exist in two divisions, the first to accomplish such objects as were named by Mr. Gallatin, the second to correspond to the well-known American "college."

The following is the statute as to the two divisions of the department of arts and science. The first "shall comprise professorships for instruction in the higher branches of literature and science, which shall be increased according to the progress of discovery, the wants of the community, and the financial means of the university. The second shall embrace what is usually deemed a full course of classical, philosophical, and mathematical instruction, and also a complete course of English literature." This statute, which contemplated what is now known as the work of "the graduate division," or "university work proper" in arts and science, was a half century ahead of the demand for such work in America, which is only now beginning to be made and to be responded to.

Nevertheless, university work proper, so far as it aims "to diffuse knowledge," has been achieved by professors of the university from the first. Samuel F. B. Morse, while a professor, conceived the recording telegraph, and in an address in 1853 named as its birthplace the present Philomathean Hall.

Prof. John W. Draper here first applied photography to the representation of the human countenance. Among other deceased professors eminent for their labors for the public were Henry P. Tappan, Tayler Lewis, George Bush, John C. Draper, and Henry Draper.

It is probable that the chief work of the faculty of arts and science in time to come will be in accomplishing the two objects pointed out by Albert Gallatin, namely: the instruction of graduate students, and the diffusion of knowledge.

In 1886 a graduate division was formally opened, which enrolled the first year twelve resident students and the second year thirty-one, besides several non-resident students. In answer to demands upon this division instruction in new fields has been begun, as, for example, comparative religion and pedagogics.

But the main effort of the faculty of arts and science has been expended from the beginning in carrying on undergraduate instruction, such as ordinarily leads to the bachelor's degree. A college has flourished which has graduated a class each year, beginning with 1832. Its standard of admission meets fully the recommendations of the State regents. Election is offered between the "scientific" course leading to the degree of bachelor of science, and the "classical," leading to bachelor of arts, and also between alternative studies in limited measure.

But every student, in order to take the bachelor's degree, must have pursued extended study in each of the three fields into which learning is divided, viz.: (1) language and literature; (2) mathematics and natural science; (3) philosophy and history. The least amount of class work assigned any of the three fields is four hundred hours in the four years' course. Fourteen professors and instructors take part in the work for undergraduates. The number of undergraduate students is at the present time 130.

The year is divided into three terms of thirteen weeks

each, including certain recesses. But in certain years the third term is shortened to twelve weeks. The tuition is free in the ordinary undergraduate course, and there are certain prizes and fellowships. There are no halls, students being expected to reside at their own homes or in approved families. Besides the graduate division, and the college proper, the department of arts and science includes in its plan whatever technical or professional schools, outside of law, medicine, or theology, the university may establish. At present there exist a school of civil engineering, a school of chemistry and assaying, and a school of pedagogy. The degree of civil engineer is given to such students as have taken the degree of bachelor of science, and have pursued the special engineering course for four years, the last year to follow the attainment of the bachelor degree. No degree is given for special work in chemistry. The school of pedagogy offers instruction in the philosophy of education to teachers of higher attainments and experience. This school has been recently founded. Other professional or technical schools are in contemplation.

The work of the faculty of arts and science is carried on in the building on Washington Square, East, extending from Washington Place to Waverley Place. This building, erected between 1832 and 1835, is conspicuous even among the many later edifices of New York city. It contains well-furnished, though not large, laboratories of physics and of chemistry, a geological cabinet, and a library. Great advantage is derived from the nearness of the Astor Library.

The department of medicine, commonly known as the University Medical College, is the second department of the university in age, but the first in the number of its professors and students. It was organized in 1841, under a faculty of six professors, of whom the best known are Dr. Valentine Mott and Dr. John W. Draper. The building was on Broadway, near Bond, and not far from the main university edifice. In 1851 a larger edifice was erected on Fourteenth street, adjacent to the Academy of Music. Upon the burning of this, in 1876, the faculty removed, after a temporary stay in the New York Hospital, to East Twenty-sixth street, fronting the Bellevue Hospital Square. A temporary building was used until 1879, when the present main edifice was erected. To this the west wing was soon added, and in 1887 the east wing, which is "The Loomis Laboratory." The main building contains the lecture-room and the amphitheatre, each seating 500 students, together with the professors' private rooms and the dissecting-room. The west wing contains eight section-rooms, or small lecture-rooms. In these the material available to the university, through its dispensary and through the department of the commissioners of charities and corrections, is brought under the observation of each student, and thoroughly utilized in the system of "section-teaching" devised by this faculty and peculiar to this school. The college dispensary treats over 9000 patients annually. The material for clinical lectures from Bellevue Hospital, and other hospitals and dispensaries, with which the lecturers are connected, is so great that the faculty in 1885 resolved to provide special facilities for advanced students in the way of instruction in diagnosis and treatment. The graduating class is divided into sections of twenty-five each, which receive separate instruction for one or two hours daily throughout the term, under the ten principal professors. In 1886 an unknown friend of the university, by the gift of \$100,000, secured to the department of medicine a laboratory-building, attaching to his gift two conditions: first, that the name of the donor should not be made public; and second, that the building should be known as "The Loomis Laboratory of the Medical Department of the University of the City of New York." The building, five stories fire-proof, is furnished with every valuable accessory for its purposes. Laboratories of materia medica, physics, chemistry, physi-

ology, biology, and pathology are found in succession by one ascending from the first to the fifth floors.

For the degree of doctor of medicine three years of study are required, including two full winter sessions of lectures, the second in this college, with the passing of written examinations under seven professors. There are three sessions of study: The preliminary, in September; the winter session, October to March; the spring session, March to May. The attendance of students has reached 649 in 1888. The total number of graduates exceeds 5000. The professors and lecturers number 60. Nearly 100 students are enrolled from countries other than the United States. Liberal provision is made for the aid of meritorious students.

The department of law in the university, commonly entitled "The University Law School," was fully planned in 1835 by the Hon. Benjamin F. Butler, Attorney-General of the United States, and his plan was adopted by the council. The position of senior law professor was offered to Mr. Butler and accepted, to take effect in 1837. This plan and the correspondence relating thereto were published in 1835. But the execution of the plan was arrested, and it was not till 1858 that the faculty of law was organized. Since that date instruction has been carried on without intermission. The annual average enrolment of students has been about fifty. The number in 1888 is one hundred. The course for the degree of bachelor of laws is completed in two years, terminated by examinations both oral and written.

In addition to the three professors there are seven lecturers chosen from among the eminent members of the New York bar, who deliver each a course upon a special field of legal learning. There is a special prize given to the junior passing the best examination, and prizes to seniors for pre-eminence in the oral examination and in the written.

The law library was founded in 1863, by John Taylor Johnston, and has received some large additions. Its collections are supplemented by those of the neighboring Astor Library. The lecture- and library-rooms of the law school are in the main university building.

The chancellors of the university have been James Mathews, D. D., Theodore Frelinghuysen, LL. D., Isaac Ferris, D. D., LL. D., Howard Crosby, D. D., LL. D., John Hall, D. D., LL. D. Since 1885 the executive work has been devolved upon a vice-chancellor, Henry Mitchell MacCracken, D. D., LL. D.

NEZ PERCÉS, or SAHAPTINS, a tribe of American Indians, who also call themselves Numepo. The origin of the name Nez Percé (Pierced Nose) is unknown, and there is no proof of their ever having had a custom to justify it. But, like other tribes of the North-west, they practised flattening of the head of children to some extent. Lewis and Clarke in 1803 found them on the Clearwater and Lewis Rivers, and a treaty of peace then made was faithfully observed until after the admission of Oregon as a State. In 1832 Capt. Bonneville found them friendly, and in 1836 Rev. Marcus Whitman and Rev. Lyman Spaulding, being sent out by the American Board of Commissioners for Foreign Missions, established a mission among them. They were then reckoned at 4000 souls. Whitman made special effort to promote agriculture, and Mrs. Spaulding conducted a successful school. Considerable improvement has been made in their condition, and after the American Board withdrew its aid the work went on. But in the spring of 1847 trouble arose from a severe epidemic of measles, introduced by a band of white immigrants. In September Dr. Whitman was murdered by the Cayuses. The mission, which had been mainly sustained by his labors, was destroyed. Yet in 1855, when the Indians of Oregon, alarmed at the inroads of the whites, made an insurrection, the Nez Percés, who had been deprived of much of the land they claimed, remained faithful to their treaty. They saved the life of Gov. Stevens and assisted the troops under Col. Sreptoe.

They were assigned a new reservation on the Lapwai River in Idaho, but those that settled here were rudely disturbed in 1859 by gold-seekers and for a time thoroughly demoralized. The Presbyterians revived the mission in Oregon and again had success in training the Indians in religion and peaceful industry (See **INDIANS, AMERICAN**). Others of the tribe refused to accept the treaties which reduced their reservations, and their remarkable history is given under **INDIAN TERRITORY**.

NIAGARA. This river flows from Lake Erie to Lake Ontario, a distance of 36 miles, in which it has a total fall of 336 feet, 52 being in the rapids above the magnificent cataract which has given it fame. The American Fall is 155 feet high and 1100 feet wide; the Horseshoe Fall 165 feet high and about 2000 feet wide. These are separated by Goat Island, which contains 62 acres. The total width of the river, including the island, is 4750 feet. The water passing over the falls every hour is estimated at 100,000,000 tons. Both the American and Horseshoe Falls are rapidly wearing away in the centre. The tendency to this in the Horseshoe Fall has been apparent for many years, but to-day the centre is in the form of a V, with the apex many rods up the stream. The American Fall has not shown such a tendency until quite recently, but now there is a well-defined V in the line, as it is seen from Luna Island. Those who have watched the recession of the falls believe that soon nearly all the water will pass through an inner channel far away from the vintor. There is also danger that the Canadian side of Goat Island may be washed away. Much of that side of the island, which is toward the former Terrapin Tower, has disappeared within a few years, and the Legislature of the State has been asked to appropriate money for the sinking of wooden cribs to prevent further erosion.

The Falls of Niagara are one hour's ride from Buffalo, twelve from New York, fourteen from Chicago. The principal village on the river is Niagara Falls, N. Y. Two miles below is Suspension Bridge. Opposite this what was formerly known as Clifton is now Niagara Falls, in the Province of Ontario. Fifteen miles to the north, at the mouth of the river, is the town of Niagara, Ontario. On the American side there is a distance of three miles between the falls and the whirlpool, but there is easy communication by horse-cars. On both sides of the river the immediate vicinity of the falls is free to all visitors.

Niagara Reservation.—The Legislature of New York in 1883 authorized the Governor to appoint five persons to be known as "The Commissioners of the State Reservation at Niagara," who were empowered to select and locate such lands as might be proper and necessary to be reserved for the purpose of preserving the scenery of the Falls of Niagara and of restoring such scenery to its natural condition. The compensation to be paid by the State to the respective property-owners, having been determined by appraisers appointed by the courts, the Legislature, in 1885, appropriated the sum of \$1,433,429.50 for the payment of the several awards. The act also provided that the lands shall be kept open and free of access without fee, charge or expense to any person for entering upon or passing to or over any part thereof. Subsequently the control and management of these lands was given to commissioners, who have power to lay out, manage, and maintain the reservation. They serve without pay, but are reimbursed for actual expenses incurred in the performance of official duties. Vacancies in the board are filled by the Governor. They are authorized to appoint a secretary and treasurer of the board. They are required to make an annual report of their proceedings, with such recommendations and suggestions as they see fit.

"The New York State Park at Niagara Falls"

Bird's-eye View of Niagara Falls and Vicinity.

(the official title) extends along the river-front from the upper Suspension Bridge to a point nearly a mile above the falls. It also includes what was formerly known as Prospect Park, at the very edge of the American falls, and Goat Island with its group of smaller islands. The total area in the park is 115 acres. It was opened to the public July 15, 1885. While access to the grounds is free, there are small charges for using the inclined railway and the elevators, for visiting the cave of the winds, and for riding on the steamer Maid of the Mist. In the upper part of Prospect Park there has been established a reception house, a public lavatory, a bureau of advice for excursionists, including arrangements for picnics with shelters, and the office of administration. The taking of provisions upon any other part of the reservation is forbidden. The disfiguring objects have been removed from Upper Prospect Park. All along the edge of the crags a space has been prepared for people to stand upon, from twenty to thirty feet wide, and extending from the brink of the falls to the high ground back of the old wooden balcony, from all of which a fine view is had of the nearer fall, the river above it, the islands, the Canadian falls, and the Ontario reservation. The surface of this standing space has been reduced to a slope with an inclination toward the falls of about 1 in 16, which allows visitors at a distance to look over the heads of those nearer the more attractive point. A balcony has been built to enlarge the available space on the projection of rock south of the wall of the inclined railroad. A new

safety cable has been placed upon the inclined railway. The electric lights have been removed from Prospect Park, and access is allowed to neither the park nor the island after dark.

Similar improvements are also to be reported upon the Canadian side of the falls. Government Commissioners surveyed and outlined the lands proposed to be taken, the area of which was about the same as that upon the American side, but the amount allowed by the arbitrators was \$978,000, or considerably less than the amount paid by the State of New York. There was so much opposition to this plan that the amount was finally reduced to \$402,000, or \$100,000 in excess of the valuation of the government. The grounds finally taken extend southward from the Clifton House for nearly two miles and include the Cedar Islands, to which an admission is charged. The Clifton House remains, but the old museum and a long line of unsightly buildings will be removed.

Bridges.—The Niagara Railway Suspension Bridge is described in the *Encyclopædia Britannica*, under BRIDGES, § 80. It was built by John A. Roebling, being commenced in 1852. The first railroad train passed over it in March, 1855. In 1886 the four stone towers which supported its cables were replaced with steel towers. The Upper Suspension Bridge, closer to the Falls, was built in 1868. It is a light, graceful structure, 1268 feet long and 200 feet above the river, which is there 190 feet deep. Originally intended for foot-passengers only, it was afterwards allowed to be used by single carriages. In 1887 it was widened to a

Cantilever Bridge over the Gorge at Niagara Falls.

double track; the old cables were replaced with larger ones; iron trusses took the place of wood and the towers of heavy-framed timbers gave way to towers of steel. All these changes were made without interfering with the traffic.

The still more remarkable cantilever bridge was commenced on April 5, 1883, and opened for travel on December 20 of that year. This was the earliest bridge completed upon the cantilever plan in the United States; the new bridge over the Hudson River at Poughkeepsie, the bridge over the Firth of Forth in Scotland, with a clear span of 1000 feet, and the bridge over the Fraser River, in Canada, are later examples of the same design. The bridge at Niagara Falls has a double-track railroad, and can carry upon each track at the same time a freight train of the heaviest kind, extending the entire length of the bridge, headed by two "consolidation" engines, and can withstand a side pressure of 30 pounds per square foot, which pressure is produced by wind having a velocity of 75 miles per hour. Under the above loads the structure is strained to only one-fifth of its ultimate strength. The total length of the bridge proper is 895 feet, divided into 2 cantilevers of 375 feet on the Canadian side and 395 on the American side, supported on steel towers rising from the water's edge. A fixed span of 125 feet is suspended from and connects the river arms of cantilevers; the clear span across the river is 500 feet, being the longest double-track truss span ever built. The excavations were carried down until solid rock was reached, when blocks of "béton coignet" (q. v.) 20 feet wide, 45 feet long, and 10 feet thick, were put in. These form one solid mass that will withstand a pressure almost equal to the best Quincy granite, and will so distribute the load of 1600 tons that comes upon each pair of steel columns that it will produce a pressure of but 25 pounds per square inch on the natural formation. Upon the béton blocks, 4 in number, was built masonry of the most substantial character, carried up 50 feet above the surface of the water. On these foundations the steel towers rest, rising 130 feet above the masonry, and upon these are set the steel superstructures. The material was subjected to the most rigid inspection and tests from the ore until it entered the completed structure. For erection at the bridge site temporary scaffoldings, which used some 600,000 feet of timber, were built from the bluff on either side out to the edge of the water, on a level with the top of the bluff. Upon these the shore arms of the cantilever were erected, one end resting on the steel towers and the other upon masonry on the bluff. The shore ends are anchored to this masonry, so that it will take an uplifting force of 400 tons at each end to displace it. This constitutes the counterweight to balance the unequal loading on the river arm, and as this load, under the most unfavorable conditions, can never equal 200 tons, the provision is ample. After the structure was completed from the shore to the steel towers came the difficult portion of the work—to span the 500 feet across and 245 feet above a roaring river whose forces no earthly power can stay, and no temporary structure can survive a moment. Here the skill of the engineer came in to baffle nature. The design of the cantilever was such that, after the shore arm was completed and anchored, the river arm was built out, one panel or section at a time, by means of great travelling derricks, being self-sustaining as it progressed. After one panel of 25 feet was built and had its bracing adjusted, the travelling derricks were moved forward and another panel erected. Thus the work progressed, section by section, until the ends of the cantilever were reached, when there still remained a gap of 125 feet to close. Into this was swung and suspended from the cantilever arms an ordinary truss bridge, forming the connecting link and completing the structure. Compensation for expansion and contraction was provided for by an ingenious arrangement between the ends of the cantilever and fixed span,

allowing the ends to move freely as the temperature changed, while yet preserving perfect rigidity against the side pressure from the wind. There were no guys for this purpose, as in the Suspension Bridge, but the structure was completed within itself. Neither was there any of that wave motion noticed on a suspension bridge as a train moves over. (F. G. M.)

NICCOLINI, GIOVANNI BATTISTA (1782-1861), an Italian poet, was born at the Bagni di S. Giuliano, Oct. 31, 1782. He was educated at the University of Pisa, and enjoyed the friendship of Ugo Foscolo. Several of Niccolini's tragedies were founded in Greek themes, as *Polissena*, *Medea*, *Edipo*, and he also translated from Æschylus the *Seven against Thebes* and the *Agamemnon*. His *Matilda* was an imitation of Home's *Douglas*. Under the government of Elisa Bonaparte he was made professor of history and mythology. His lectures and prose writings were notable contributions to Italian literature. On the downfall of Napoleon he published an allegorical tragedy, *Nabucco*. Still greater success had his *Antonio Foscarini* (1827), and his revolutionary drama, *Giovanni di Procida* (1830). *Ludovico il Moro*, written about the same time, was not allowed to appear until 1847, but his *Arnaldo da Brescia*, in which he gave expression to the ardent desire of the people of Italy for religious and intellectual liberty, was printed secretly at Marseilles, in 1843. *Filippo Strozzi* (1847) contained a representation of the fallen yet not hopeless state of Italy. Among the works of his later years is the lyrical drama, *Murio e i Cimbri*. He died at Florence, Sept. 20, 1861.

NICHOL, JOHN PRINGLE (1804-1859), a Scotch astronomer, was born at Brechin, Jan. 13, 1804. He was the son of a bookseller, and studied for the ministry, but after being licensed to preach became a popular lecturer on astronomy, and was professor of practical astronomy in the University of Glasgow. He died at Rothesay, Sept. 19, 1859. Among his works are *The Architecture of the Heavens* (1838); *Contemplations of the Solar System* (1844); *The Stellar Universe* (1848); *The Planetary System* (1851); *Cyclopædia of the Physical Sciences* (1857).

His son, JOHN NICHOL, was born at Montrose, Sept. 8, 1833. He graduated at the University of Glasgow in 1855, and at Oxford in 1859. He was made professor of English literature in the University of Glasgow in 1861. He has been a popular lecturer on literature, and has contributed to the leading British views and to the *Encyclopædia Britannica*. Some of his essays were collected under the title *Fragments of Criticism* (1860). He has also published *Hannibal*, a drama (1872), *Byron* in the "English Men of Letters" series (1880); *Robert Burns* (1882). His article on *American Literature* in the *Encyclopædia Britannica* has been published separately.

NICHOLSON, ALFRED OSBORN POPE (1808-1876), Senator, was born in Williamson co., Tenn., Aug. 31, 1808. He graduated at the University of North Carolina in 1827, and after studying medicine for two years turned to law. He was admitted to the bar at Columbia, Tenn., in 1833, and was elected to Congress, where he served three terms. In 1840 he was appointed U. S. Senator on the death of Felix Grundy, and in 1843 was elected to the State Senate. In 1845 he removed to Nashville, where he edited the *Union*. In 1850 he was appointed a chancellor but held the office only one year. In 1853 he became editor of the *Union* at Washington, D. C., and soon after was chosen public printer. Returning to Columbia, in 1857 he was elected to the U. S. Senate, but retired on the secession of Tennessee in June, 1861. On account of his sympathy with the Southern Confederacy he was sent south of the Union lines, and on his return was imprisoned at Nashville. In 1870 he was a member of the State Constitutional Convention, and was also elected to the State Supreme Court, of

which he became chief-justice. He died at Columbia, Tenn., March, 1876.

NICKEL. The production of this metal in the United States is given under METALS, and its use in U. S. coins is shown under MINT. The former shows a sudden great decline in production in 1883.

This was due to the large shipments of rich nickel ores from the mines of New Caledonia, an island east of Australia, belonging to France and used as a penal colony. In 1867 M. Garnier in making a geological exploration of this island found serpentine rock with light green veins. Samples from these on being carefully examined in France proved to contain a new mineral, hydro-silicate of nickel and magnesia, which was named Garnierite in honor of the discoverer. Not until 1874 was the mineral found in large quantities. Then a vein about four feet thick was found in Mont Doré on the south side of the island, and afterwards other veins with still richer ore, said to contain about 15 per cent. of the metal. Yet the ore shipped to France in 1875 yielded only about 6 per cent. In the next year the shipments were said to be of three grades; the richest yielding 18 to 20 per cent., the second rate 12 to 15 per cent., and the poorest 6 to 8 per cent. But by far the largest amount was of the last grade. In 1883 the exports were 9024 metric tons of ore which yielded 824 tons of nickel, or about 9.13 per cent. Garnierite is found in small quantities over the whole island, but only in paying quantities in the north-west. The district believed to be richest, Bourindi, is not yet worked. This is owing to the difficulties of access, of climate, and of labor. Water is everywhere scarce. The natives can be used only for transportation and incidental work, and easily succumb to disease, so that the hospitals are kept full and the rate of mortality is high. The French convicts are worthless as miners; the Chinese are found the best, though they require constant watching. From the Palta district in Mont Doré the ore in sacks of sixty-six pounds is carried successively on pack-horses, horse-cars, steam-railroads and scows, a distance of over 1000 miles before it reaches the steamers which take it to the island of Noumea. There it is smelted into a regulus of 60 or 70 per cent. nickel, granulated and then shipped to England. Latterly the mines at Thio have been more worked. These extend over 6000 acres, the veins vary from three to seven feet in thickness, and the average ore yields 10 per cent. The transportation from Thio is much less arduous than from the Palta district, there being more conveyance by water.

The Nickel Company of Paris now controls the production in New Caledonia, and the richness of these mines has compelled those in other countries almost entirely to suspend operations. While garnierite yields on an average nearly 10 per cent. of metallic nickel, pyrrhotite, from which nickel is obtained in Lancaster co., Pa., yields only 1.5 to 2 per cent. Although ores of nickel have been found in some other States, none have been profitably worked, or seem likely to be so. The duty on nickel imported into the United States is 30 cents a pound, but on its alloy with copper 20 cents, and foreign producers have found it practicable to make an alloy as pure as ordinary commercial nickel, and yet have it admitted at the latter rate. The price of nickel for some years has been two shillings (50 cents) a pound in London. This price is believed to be forced by the Nickel Company with a view to crushing out competition and then advancing the price. Yet in 1886 the company offered to make contracts for ten years at this rate. The American production, which in 1884 had sunk to 64,550 pounds, rose again in 1885 to 245,504 pounds, valued at \$169,398, and in 1886 was 182,345 pounds, valued at \$109,407. There were also in 1886 contributions of ore and matte amounting to 32,647 pounds, and valued at \$17,750. The price has sunk from

\$2.60 per pound in 1876 to 60 cents in 1886. The imports of nickel and its alloys in 1868 were valued at \$118,058; they afterwards decreased until in 1876 only 156 pounds, valued at \$10, were imported. Then they rose steadily, reaching in 1882 the maximum of 200,728 pounds, valued at \$143,660. In 1886 they were 159,760 pounds, valued at \$89,003.

The German Empire in 1873 adopted nickel alloy for some of its minor coins. This greatly increased the demand for the metal, and its price went up to 16 shillings, and for some years averaged 12 shillings a pound. When the supply finally had to be obtained from the French company, the German government, in 1883, gave up the use of the metal, and thus helped to cause a great fall in its price. The consumption previous to that time was estimated to be as follows: England, 500 metric tons; Germany, 300; United States, 200; France, 100; total, 1100 tons. The production in New Caledonia for the three years 1882-84 was 2400 metric tons. Finding this in excess of the demand, the Nickel Company suspended work in March, 1885, until the stock on hand should be reduced.

The French government has been considering the substitution of nickel for copper coins. The United States continue to make 5-cent and 3-cent pieces of nickel alloy. The coinage of 1885 and 1886 was as follows:

	2-cent.	5-cent.	Nickel consumed, Troy wt.
1885	4790	1,476,490	58,616
1886	4223	3,330,290	166,729

The mint at Berlin, Germany, in 1886, made nickel coinage for the Egyptian government, amounting to 12,510,210 pieces, valued at \$216,432. Nickel-plating increases slowly, and there is decided increase in the use of nickel alloys, such as white casting metal, nickel-bronze, silveroid, and other alloys which combine cheapness with hardness, durability, and good color. (J. P. L.)

NICOL, ERSKINE, a British painter, was born at Leith, Scotland, July, 1825. He was apprenticed to a house-painter, but studied at the Trustees' Academy and became a teacher of drawing. He spent some years in Dublin, where he became familiar with Irish character. He removed to London in 1862 and was made an associate of the Royal Academy in 1866. Among his pictures are Notice to Quit (1862), Waiting for the Train (1864), Both Puzzled (1866), A Disputed Boundary (1869), Steady, Johnny, Steady (1873), Paying the Rent (1876), Storm at Sea (1876), His Legal Adviser (1877), Unwillingly to School (1877), The Missing Boat (1878). His works exhibit great power of expression, both pathetic and comic.

NICOLLET, JEAN NICOLAS (1786-1843), explorer, was born at Cluses, Savoy, July 24, 1786. Having studied under the astronomer Laplace, he became secretary and librarian of the Observatory at Paris in 1817. Emigrating to the United States in 1832, he explored the Southern States, the Mississippi River, and its western affluents. He made important collections in natural history and Indian ethnology. He was sent on a second exploring tour by the War Department, Lieut. John C. Fremont being his assistant. He died at Washington, Sept. 11, 1843. His publications were chiefly on mathematical subjects.

NIGHT-HAWK, a name formerly given to the common goatsucker of Europe, *Caprimulgus europæus*, now more frequently called the nightjar, fern-owl, etc. Night-hawk has, however, become the usual name in the United States of another bird of the same family, *Caprimulgidae*, but different genus and species, namely, *Chordeiles popetue*. It is related to the Whippoorwill (*Anarctomus vociferus*) and to the chuckwill's-widow (*A. Carolinensis*), but is quite distinct from both of these birds. It may be recognized by its long, thin, pointed wings, forked tail, extremely

diminutive beak, and very wide gaping mouth not garnished with bristles. The plumage is of variegated dark colors, with a white throat-bar and white spots on the wings and tail in the male, these white marks being buff in the female. The night-hawk is found over nearly all of North America, and is commonly seen towards evening circling high in the air in pursuit of insects with a bold and buoyant flight, occasionally uttering a characteristic note. It nests on the ground and lays two dark mottled eggs. The bird is 9 or 10 inches long and nearly two feet in extent of wings. There are other species and varieties of *Chordeiles* which receive the name of night-hawk. (E. C.)

Night-Hawk.
From Coues' Check List of North American Birds.

NIGHT-HERON is the name of several different kinds of herons belonging to the family *Ardeidae*, and to the genera *Nycticorax* and *Nyctherodius*, found in most temperate and tropical countries and somewhat

Night-Heron.
From Coues' Check List of North American Birds.

nocturnal or crepuscular in their habits. The common species of Europe is *N. nycticorax* or *N. grisea*; and from this the night-heron of the United States is scarcely specifically distinct. The latter is abundant in many parts of the United States, and in some is known as the qua-bird or squawk, from its hoarse, guttural cries. It breeds on trees in swamps in large heronries, sometimes of hundreds of pairs, and lays 2 or 3 greenish eggs. The adult birds are dark glossy green on the head and back, elsewhere mostly bluish-gray or lavender, with 2 or 3 long white slender plumes springing from the back of the head. The bill is stout and the legs comparatively short. The length is about two feet, the extent 4½ feet. The yellow-crowned night-heron is *Nyctherodius violaceus*, quite distinct from the former and a more southerly bird, seldom seen even in the Middle States. It is of the same size as the former and similar in habits, but the coloration is peculiar. (E. C.)

NIGHTINGALE, FLORENCE, renowned for her services to the sick and wounded, was born at Florence, Italy, May 4, 1820. Her father, William E. Shore, a banker of Sheffield, had assumed the name Nightingale on inheriting the estate of Peter Nightingale. She was carefully educated and early showed special fondness and aptitude for nursing the sick. In 1849 she went to Germany to obtain the usual training of deaconesses in Pastor Fliedner's school at Kaiserwerth. Her description of this school published in 1850 helped

to make it widely known in England. She then took charge of an infirmary for governesses in London, but the revelation of the sufferings of the English army in the Crimea in 1854 called her to her most important work. At the request of the Secretary of War she went as superintendent of a band of female volunteer nurses, and opened a hospital at Scutari. The immediate success of her volunteer movement broke down the barriers raised by the jealousy of army officers. She was made superintendent of all the hospitals on the Bosphorus and subsequently in the Crimea. Over all the difficulties of her self-imposed task her genius triumphed and brought order out of confusion, but her health finally gave way. Returning to England in 1856, she received the thanks of the nation. Besides other marks of honor a fund of £50,000 was raised which, at her request, was devoted to founding a school of nurses under her direction. In 1862 she was commissioned by the government to examine and report upon the sanitary state of the army in India. Though precluded by the state of her health from active work, she still observes with interest the labors of others in her chosen field. She has published several handbooks, among which are *Notes on Nursing* (1850); *Notes on Hospitals* (1859); *Notes on Lying-in Institutions* (1871); and *Life or Death in India* (1874).

NILILISM. See BAKUNIN.

NILES, HEZEKIAH (1777-1839), journalist, was born in Chester co., Pa., Oct. 10, 1777. He became a printer and was partner in a publishing firm at Wilmington, Del., in 1800. He afterwards edited a paper at Baltimore and in 1811 he founded there the weekly *Niles' Register*, which he edited until 1836. The historical information contained in it was considered so valuable that the *Register* from 1812 to 1827 was republished in 32 volumes, and a continuation was afterwards made to June, 1849, making in all 76 volumes. Niles also published *Principles and Acts of the Revolution* (1822). He died at Wilmington, Del., April 2, 1839.

NILSSON, CHRISTINE, a Swedish vocalist, was born at Hussaby, Aug. 3, 1843, of a peasant family. Her father had charge of the music at the village church, and she early displayed great musical ability. Her violin-playing and singing at a village fair attracted Count Thorerhjelm, and by his aid she received a complete education at Stockholm under Berwald and at Paris under Massé and Wartel. She made her début in *Traviata* Oct. 27, 1864. She afterwards appeared in the *Magic Flute*, in *Martha*, *Don Juan*, and other operas. In 1867 she visited London and was received with great applause, appearing in *Traviata* and afterwards as Marguerite in Gounod's *Faust*. In 1868 she took part in the Handel celebration at the Crystal Palace. She came to America in September, 1870, but did not appear in opera until the following year, when she achieved a remarkable success. In July, 1872, she was married in London to Auguste Rouzaud, a French merchant. She afterwards appeared for a short season at St. Petersburg and in 1873 returned to the United States. Her husband died in 1882, and she afterwards resumed her concerts. Her voice is noted for its purity, sweetness, and flexibility. She is an excellent actress both in tragic and in comic parts.

NILSSON, SWEN (1787-1883), a Swedish naturalist and archæologist, was born near Landskrona, March 8, 1787. He was educated at the University of Lund, and there became in 1812 instructor in natural history and afterwards overseer of the Zoological Museum. In 1828 he was placed in charge of the Museum of the Academy of Sciences at Stockholm, and after arranging this he returned in 1831 to Lund, where he was professor of zoölogy until 1856. He died there, Nov. 30, 1883. His principal works are *Ornithologia Suecica* (2 vols., 1817-21); *Skandinavisk Fauna* (4 vols., 1820-55), the illustrations to the latter being published separately. Other works were devoted to the mollusks,

fish, and fossils of Sweden. His most important archaeological work is *Skandinaviska Nordens Urminnare* (4 vols., 1838-43).

NINA, LORENZO (1812-1885), an Italian cardinal, was born at Recanati, May 12, 1812. He was educated at his native village and at Rome, obtaining the degree of doctor of theology. In 1835 he was ordained priest, and held various offices in the congregation of the council. Cardinal Amat made him his auditor, and Pope Pius IX. employed him on various delicate missions. He was then made assessor of the holy office, and in 1869 was a member of the commission to prepare for the council of the Vatican. He was also prothonotary-apostolic and consul of the congregation of rites. He was made cardinal-deacon May 12, 1877. Pope Leo XIII. made him under-secretary of state in August, 1878. He became at the same time prefect of the palace and administrator of the property of the Holy See. He conducted important negotiations with Russia, with Germany, and with Belgium. He died at Rome, July 25, 1885.

NISARD, JEAN MARIE NAPOLÉON DESIRE (1806-1888), a French author, was born at Châtillon-sur-Seine, March 20, 1806. He studied at Sainte-Barbe, and became a journalist. In 1830 he was employed in the department of instruction. In his first important work, *Les Poètes latins de la décadence* (1834), he drew a comparison between Lucan and Victor Hugo, which led to an animated controversy with Jules Janin on romanticism and classicism. Nisard was master of conferences in French literature at the Normal School from 1835 to 1843, and meantime held various positions under the ministry until 1842, when he was elected to the chamber of deputies as a conservative. In 1843 he became professor of Latin eloquence in the Collège de France, and in 1852 he was appointed general inspector of superior instruction, and also succeeded Villemain as professor of French eloquence at the Sorbonne. In 1855 he ventured to assert that the actions of rulers are not to be judged by the rules of morality applying to private station. The consequent disturbances of the students in his room gave occasion for a public trial. In 1857 he was made director of the higher Normal School, which was then reorganized. He retired from this post in 1867, when he was made senator, though he continued to be a member of the imperial council of instruction. He had been admitted to the French Academy in 1850. He died March 25, 1888. Among his publications are *Histoire de la littérature française* (4 vols., 1844-61; 6th ed., 1876); *Etudes sur la Renaissance* (1855); *Mélanges d'histoire et de littérature* (1868); *Les Quatre grands Historiens romains* (1874).

His brother, **MARIE EDOUARD CHARLES NISARD**, born at Châtillon-sur-Seine, Jan. 10, 1808, has done considerable literary work. From 1831 to 1848 he held a position in the household of King Louis Philippe and was connected with various journals. He was afterwards employed in the ministry of the interior. Among his publications are *Le Triumvirat littéraire au XVIe. Siècle*, namely, Scaliger, Lipsius, and Casaubon (1853); *Histoire des livres populaires* (1854); *Les Gladiateurs de la république des lettres* (1860); *Des Chansons populaires* (1866); *Le langage populaire ou patois de Paris* (1873). He has also edited various memoirs and historical documents.

NISBET, CHARLES. See DICKINSON COLLEGE.

NITROGLYCERINE. See EXPLOSIVES.

NOAH, MORDECAI MANUEL (1785-1851), journalist, was born at Philadelphia, July 14, 1785. He studied law and practised at Charleston, S. C. In 1811 he was made U. S. consul at Riga, Russia, and in 1813 was transferred to Tunis. On his return to America he settled at New York, where he founded and edited several newspapers, one of them being the first Sunday newspaper published there (1834). His earnest devotion to the welfare of his co-religionists was shown in 1820 in his endeavor to establish a Jewish colony on

Grand Island, in Niagara River, but the project failed. He was elected sheriff of New York, and was appointed surveyor of the port and judge of the court of sessions. He died at New York, May 22, 1851. He published *Travels in England, France, Spain, and the Barbary States* (1819); *A Translation of the Book of Jasher* (1840); *Gleanings from a Gathered Harvest* (1845), and some dramas.

NOÉ, AMÉDÉE DE, a French caricaturist, generally known by his assumed name **CHAM** (i. e., Ham, son of Noah), was the son of the Comte de Noé, and was born at Paris, Jan. 26, 1819. He early showed inclination for painting, and he received instruction from Paul Delaroche and Charlet. In 1842 his caricatures began to appear in almanacs and various periodicals. Soon they achieved great success, and were furnished chiefly to *Charivari*, but afterwards were collected in several volumes. They exhibited the ridiculous side of public events and the social life of France down nearly to 1860. After this date he published only a few vaudevilles.

NOEL, BAPTIST WRIOTHESLEY (1799-1873), an English clergyman, was born at Leightmont, Scotland, July 10, 1799. He was a brother of the first earl of Gainsborough. He graduated at Trinity College, Cambridge, in 1826, and became noted as a preacher. He was one of the queen's chaplains, and preached at St. John's, London. In 1849 he withdrew from the Established Church and became a Baptist. He was active in benevolent work among the poor. He died at London, Jan. 20, 1873. He published several volumes of sermons, some treatises on baptism and on the union of church and state.

NÖLDEKE, THEODOR (1836-1875), a German Orientalist, was born at Harburg, March 2, 1836. He graduated at Göttingen in 1861, having studied under Ewald, and afterwards went to Vienna, Leyden, and Berlin. In 1864 he was made professor-extraordinary at Kiel, and in 1868 professor-ordinary. In 1872 he was called to a professorship in the newly founded University of Strasburg. He died Jan. 20, 1875. He published *Geschichte des Korans* (1860); *Des Leben Mohammeds* (1863); *Ueber die Amalekiter* (1864); *Die Alttestamentliche Literatur* (1868); *Untersuchungen zur Kritik des Alten Testaments* (1869); and *Die Inschrift des Königs Mesa von Moab* (1870). He contributed to the *ENCYCLOPEDIA BRITANNICA* on Oriental subjects.

NOMENCLATURE, GEOGRAPHICAL. The greatly varied spelling given by different writers to geographical names renders it often difficult to discover the relationship between the various spellings or to be sure whether or not two unlike words refer to the same place. The same difficulty exists in regard to biographical names. Hitherto there has been no standard of spelling in biography and geography, most travellers seeking to give to the words as pronounced by natives of foreign countries the nearest parallel sounds in the alphabet of their own language, but usually hearing and interpreting differently, so that considerable variations exist in the spelling of these names, except where long usage has given them a fixed form. Familiar examples are the two spellings Otahcite and Tahiti, which are certainly not at once recognizable as variants of the same name. The same may be said of Hawaii and Owhyhee, which would naturally be taken as names of quite different places, not as different spellings of the same name. Many instances might be given in which, though the difference is less, the lack of familiarity is more calculated to produce confusion. Numerous examples of the same kind could be drawn from the annals of biography. If we take the name of the great Mongol conqueror of the thirteenth century, it is to find it spelled by the French Djenguis or Djenguyz, by the Germans Dschengis, by the English more simply Jengis or Jengiz, and by certain writers Chingis, Tchenguyz, and in various other methods, this distinguished barbarian being so fortunate as to

have more than twenty different spellings to his name, besides others which are manifest errors. Similar discrepancies exist in the spellings of many other names, of which we may instance the Russian poet, Pooshkin or Pushkin in English, Pouchkine or Pouchekine in French, and Puschkin in German, and his fellow-poet, Derzhavin, Derjavine, or Derschawin. A more recent example is the Russian novelist, Toorgeneff or Turgenieff.

The above examples will suffice to show the great need of a revision of method in the spelling of foreign names, and the adoption of some clearly defined system of orthography, for the use of English writers at least, if not a general system for the use of all the writers of civilized communities. Although this necessity has been long recognized, no steps of an authoritative character have been taken by biographers to produce a uniform spelling of proper names, and no generally accepted ones by geographers. Dr. Joseph Thomas says, speaking of biographical names, that there are only three courses that can possibly be pursued: "(1) To blunder over, or pronounce such names at random; (2) to endeavor to pronounce all names, foreign and English alike, according to English methods of orthography; (3) to adopt the system of pronunciation now generally recognized by the more highly educated classes in England, America, and continental Europe; that is, to pronounce all names, as nearly as possible, as they are pronounced by the well-educated people of the country to which they belong, with the exception of such names as have acquired an established English pronunciation." The third method, which he adopts as the only rational one, does not present as many difficulties in spelling as might be imagined, and could in his opinion be generally adopted with very little difficulty. All suggestions in regard to biographical spelling, however, have been personal only, and none of them carry the weight which would attach to a body of fixed rules adopted by a recognized congress of biographers.

In regard to geographical orthography, the Royal Geographical Society of England, feeling that some method of producing uniformity in spelling was seriously demanded, adopted in 1886 the following rules, which are the same as those which were previously in use in the orthography of the Admiralty charts. The high standing of the society gives its utterances and recommendations much weight, and we append its adopted rules. These rules apply only to those names which are not written in Roman characters in the countries to which they belong. In Spain, Portugal, Holland, and other countries which use Roman characters the native spelling will be preserved; nor will in any case a change be made in the spelling of names which long usage has rendered familiar to English readers. The true sound of the word, as locally pronounced, is to be taken in all cases as the basis of the spelling, but the finer inflections of sound and accent are not required to be preserved, a reasonable approximation to the sound being all that is deemed desirable.

As a general rule of orthography, vowels are to receive the Italian, consonants the English sound. No accent is to be used but the acute, and this only where it is demanded by a particular stress upon some syllable of the word. Every letter is to be sounded, and where two vowels come together each should be sounded, though sometimes so quickly as to seem but one sound, as in *ai*, *au*, and *ei*. Hindu names will be accepted as they are spelt in *Hunter's Gazetteer*. The sounds of the several letters of the alphabet are as follows:

A as in *father*.

E as in *benefit* or *eh*.

I as in *machine* or English *e*. Thus *Fiji*, not *Feejee*, is the correct spelling.

O as in *mole*.

U as in *mute*.

All vowels are shortened in sound by doubling the following consonant. The vowel is to be doubled only when there is a distinct repetition of the sound, as in *Nuulua*.

Ai corresponds to English *i*, as in *ice*.

Au corresponds to English *ow*, as in *how*.

Ao is slightly different from *au*, as in *Macao*.

Ei has the sound of the two Italian vowels, but is frequently slurred and resembles *ey* in *they*. Example, *Beirut*.

The consonant sounds are as follows:

B, D, L, M, N, P, R, S, T, V, W, and Z as in English.

C is to be always soft, but usually should be replaced by S, which it so closely resembles.

Ch always soft, as in *church*.

F as English *f*. Ph should not be used for *f*. Write *Huifong*, not *Haiphong*.

G is always hard. Soft *g* is given by *j*.

H is to be always pronounced when given.

J as English *j*. Dj should never be used for *j*.

K as English *k*. This letter should always be used for hard *c*. Example: *Koreu*, not *Corea*.

Kh is the Oriental guttural, as in *Khan*.

Gh is another guttural, as in Turkish *dugh*, or *ghazi*.

Ng has two sounds; one as in English *finger*, the other as in English *singer*.

Q should never be used.

Qu is given as *Kw*. Example: *Kwangtung*.

Y is always a consonant, as in *yard*. It should never be used as a terminal, but be replaced by *i* or *e*.

To what extent these useful rules will be adopted is a matter to be settled by time. They may come into general use or may serve as a basis for more fully considered rules, to be chosen by some future congress of societies. At all events they mark an important step toward a highly desirable reform and may arouse those who have suffered from the annoyance of indiscriminate spelling to some decided measures of improvement in this direction. Probably the final system of geographical and biographical orthography will be one that can be applied with little or no variation by all the enlightened nations of modern time and will help towards that general linguistic conformity which is so desirable.

Another subject of importance may be noted in this connection—the superabundant nomenclature of zoological, botanical, geological, and other sciences. The species of animals and plants have been renamed so frequently by different observers that the superabundant lists of synonyms are confusing and often misleading, and it is highly desirable that some authoritative body should adopt a fixed rule of biological nomenclature which will reduce the names to a single accepted one for each species. This is being gradually done by the labors of specialists throughout the world, while varieties which have been classed as species are also being dropped, but the task is a difficult one and many years will be needed for its full accomplishment. A similar difficulty exists in the science of geology, in which the same formation bears different names in different parts of the earth, and there is a great need of a revision and simplification of the nomenclature. Important steps in this direction were taken at the London meeting of the International Geological Association in 1888, which it is to be hoped may go far to remedy the existing confusion. (C. M.)

NORDENSKJÖLD, NILS ADOLF ERIK, BARON, a Swedish Arctic explorer, was born at Helsingfors, Finland, Nov. 18, 1832. His father, Nils, was a distinguished mineralogist and took him early on exploring tours in the Ural Mountains. The son after graduating at Helsingfors, in 1857, went to Stockholm, where he was appointed professor of mineralogy. He assisted in Arctic expeditions in 1859 and 1861, and organized others in 1864 and 1868. In the last of these, conducted in a steamer, he reached on Sept. 19, 1868, a point in 81° 42' N. lat. He also thoroughly explored Spitzbergen, and on his return made known its geology, mineralogy, botany, and zoölogy. In 1870 he visited Greenland, where he found the three largest meteorites yet known. In 1872 he set out again for Spitzbergen, where he spent the winter, and in the

following spring, with a single companion, went north to the Seven Islands. His subsequent voyages and his success in accomplishing the North-East passage have been recounted under ARCTIC EXPLORATION. The results of this expedition have been published in several volumes and translated from Swedish into other languages. Besides other honors Nordenskjöld was raised to the peerage. In 1883 he again sailed for Greenland and conducted an expedition farther into the interior than had ever been done before.

NORDHOFF, CHARLES, journalist, was born at Erwitte, Prussia, Aug. 31, 1830. At an early age he was brought to the United States by his parents, who settled at Cincinnati. In 1844 he went to Philadelphia and entered the navy. He sailed around the world and served on merchant vessels until 1853, when he became a printer. In 1857 he entered upon literary work in New York, and he was connected with the *Evening Post* from 1861 to 1871, when he went to California. After a visit to Hawaii in 1873 he removed to Washington, where he has since been a special correspondent of the *New York Herald*. His publications include *Man-of-War Life* (1855); *Whaling and Fishing* (1856); *Cape Cod and all Along Shore* (1868); *Politics for Young Americans* (1875); *The Communitistic Societies of the United States* (1875); *The Cotton States in 1875* (1876); *God and the Future Life* (1881).

NORFOLK, a city of Virginia, in Norfolk co., is on the Elizabeth River, 8 miles from Hampton Roads, and 33 miles from the Atlantic Ocean. It has an excellent and capacious harbor. There are 2 railroads, 3 canals, and several lines of steamers connecting it with New York and other cities. Norfolk has a custom-house, a city-hall, court-house and jail, 2 national and several other banks, 28 churches, good public schools and several academies, 4 daily and 6 weekly newspapers. The city has a good water supply, is lighted with gas, and has a paid fire department. Norfolk was settled in 1705, and was made a city in 1845. It was burnt by the British in 1776. At the opening of the civil war in 1861 the U. S. navy-yard at Gosport, in the vicinity, attracted attention. It contained 12 large vessels, brought thither for repairs. When the place was threatened with capture by Virginia troops the U. S. commander deemed it necessary to destroy the vessels and the works of the navy-yard. Most of them were burnt, but the Merrimac, which had been scuttled and sunk, was raised by the Confederates and made an iron-clad. For its famous fight with the Monitor, see IRON-CLADS. Norfolk was soon after abandoned by the Confederates and remained in possession of the Union troops till the close of the war. Its commercial prosperity is now reviving.

NORMAL SCHOOLS. Normal schools are institutions for the training of teachers for the common schools. The first school of the kind was established at Rheims, in France, in 1681, by the Abbé Jean Baptist de la Salle, whose character and work have been set forth under BROTHERS OF THE CHRISTIAN SCHOOLS. But although France is entitled to the honor of having first instituted the system of normal training, Germany deserves the credit of having adopted, extended, and perfected it. The benevolent Hermann Francke (1663-1727. See sketch in the ENCYCLOPÆDIA BRITANNICA) turned his attention to the subject of popular education in the city of Hamburg. He bent all his energies toward the establishment of a teachers' seminary, in which he finally succeeded at Halle, in Prussia, about 1704; and from this institution well-qualified teachers were soon spread over all the north of Germany.

The kingdom of Prussia took the lead in the establishment of normal schools. The first normal school—in Germany called a *Pädagogium* or teachers' seminary—supported by the state was established at Stettin, in Pomerania, in 1735; the second at Potsdam, in Brandenburg, in 1748; the third at Breslau, in Silesia,

in 1765; and from the middle of the eighteenth century teachers' seminaries gradually spread all over Germany. Some of them are private institutions; but the government exercises the right of supervision over them. A brief description of the celebrated normal school of Potsdam will best explain the normal system as it exists in the different countries of Europe, for with slight deviations nearly all the European schools were modelled after it. The Potsdam Normal School and its annexed model-school or school of practice are placed under a director or principal, subordinate to the royal school-board of the province of Brandenburg, at Berlin, and to the minister of public instruction. The last-named authority lays down the principles to be followed in this school, exacts an account of all important matters, such as the examination of the masters, and any change in the fundamental plan of the studies; and receives every year, through the medium of the royal school-board, a detailed report prepared by the director of the school. The school-board is charged with the special inspection of the normal school; it must watch its progress, and from time to time send commissioners to make inquiries on the spot. It examines and approves the plan of studies presented every half year, and decides upon all questions submitted to the consistory. The director superintends the whole establishment, observes and directs the master and servants, makes reports to the superior authorities, and carries on the correspondence.

The number of pupil-teachers is fixed at from 70 to 80, and to instruct these there are 6 masters, besides the director. The conditions for admission are somewhat rigid. The candidates must be in good health, and free from all bodily infirmity; they must be 17 years old, and belong to the Evangelical religion; they must produce certificates of birth and baptism, school-certificates, and certificates of good conduct. The examination for admission is partly written and partly oral. The oral examination is confined to religion, grammar, reading, logical exercises, and arithmetic. They are examined also in singing, the piano-forte, and the violin. When a candidate passes a successful examination he is bound to sign the following engagement to the director, with the consent of his father or guardian: "I, the undersigned, M—N—, by these presents, bind myself conformably with the ordinance of the royal minister of public instruction and ecclesiastical and medical affairs to place myself during three years, after my leaving the normal school, at the disposal of the king's government, and consequently not to subscribe anything contrary to this engagement; or in such case to refund to the normal school the expenses incurred by the state for my instruction."

In the first year formal instruction predominates; in the second material instruction, and in the third practical instruction. Formal instruction consists of studies calculated to open the mind, and to inculcate on the pupils good methods in every branch, and the feeling of what is the true vocation of a primary teacher; material instruction, or more positive instruction, occupies the second year, in which the pupils go through the special studies of every solid kind, much of which they may never be called upon to teach; practical instruction, or instruction in the art of teaching, occupies the third year. In the last year the pupils are obliged to give ten well-prepared lessons a week in the model school, or school of practice. At the expiration of the three years' course the pupil-teachers are compelled to pass a rigid examination, not only in the subjects they have studied but also in the methods of teaching them.

Normal schools in Prussia are divided into public or private, superior or chief seminaries, and secondary or small seminaries. By a chief seminary was originally understood such seminaries as were completely organized according to the requirements of the laws. After-

wards they were distinguished by the fact that a special commission of examination was appointed for them, to which commission the head-teacher and the director belonged. But by a later regulation a commission for this purpose was appointed to the small, and even the private, as well as to the superior seminaries.

In 1794 a normal school was established at Paris by the national convention; but the institution was projected on a scale beyond the preparation of its earliest pupils. The instruction was mainly by lectures, delivered by such eminent scholars as Lagrange, Laplace, Sicard, Laharpe, and others, and was far above the comprehension of the immature students of the school. It was, therefore, abandoned in 1795. After the reorganization of the university, in 1806, the expediency of reviving the normal school was felt, and it was reorganized accordingly, in 1808. The number of pupils provided for by the new plan was 300; but from 1810 to 1826 there were never more than 58 in actual attendance. According to the plan of instruction, lectures were to be attended elsewhere, and interrogations and study to take place within the school under the charge of the elder pupils. The recitations of the pupils to each other were called conferences; a name which is still pre-served, being applied to the lessons given by the teachers, who are called masters of conferences. The duration of the course of instruction was at first limited to two years, but subsequently extended to three. The school was a second time suppressed in 1822, and in 1826 an institution termed a preparatory school was substituted for it, which in its turn was abolished and the old normal school revived by a decree of the lieutenant-general of the kingdom, Aug. 6, 1830. A report was made by M. Cousin, Secretary of the Council of Public Instruction, in October, 1830, the recommendations of which were substantially adopted. The school then commenced a career of usefulness which has been increasing ever since.

The officers, in 1837, were the director, who did not reside at the school nor take part in the instruction; the director of studies, the resident head of the establishment; eight masters of conferences for the section of letters; six masters of conferences for the section of sciences, and one for the drawing department; two "preparers;" a sub-director, charged with the general superintendence of the pupils; and two assistants, called superintending masters. The masters of conferences have, in general, duties equivalent to those of professors in colleges. The qualifications for admission are high, and the course of instruction during the three years' course much in advance of the ordinary normal school. The Paris Normal School resembles a college with a normal department attached to it.

In 1811 the Count de Lezai Marnesia founded a normal school for primary teachers at Strasburg. The course of instruction embraced four years, and included as wide and thorough a range of studies as is now required in the best normal schools of France. According to a report of M. Guizot to the king, in 1833, it appears that the state of primary education in the two departments constituting the Academy of Strasburg was far in advance of any other section of France. Good schools were more numerous, fewer communes were destitute of schools, and the slow, defective method of individual instruction had given place to more lively and simultaneous methods of class instruction. "In all respects the superiority of the schools is striking, and the conviction of the people is as general that this superiority is mainly due to the existence of this normal school."

The establishment of 2 normal schools for the departments of Moselle and Meuse, in 1820, was followed by the same results—the establishment of schools in communes before destitute and the improvement of schools already in operation, by the introduction of better methods. At the close of 1829 there were

13 normal schools in operation in different sections of France. In the three years immediately following, 34 new normal schools were established. The establishment and extension of the normal system in France and, it may be said, in Europe and America are mainly due to the exertions of Cousin and Guizot. Their investigations and writings attracted the attention of educators and statesmen in every civilized country of the world. Such was the success of these two eminent men that in 1849 there were 93 normal schools in France, including 10 institutes belonging to the Brothers of the Christian Schools, and 3 for female teachers under the auspices of an Association of Christian Education on a similar plan. After the re-establishment of the Empire by Napoleon III., obstacles were thrown in the way of the successful operation of the normal schools, and as a matter of course there followed a marked decline in their efficiency. But since the establishment of the Republic in 1871 they have been not only restored to their former good condition but have been greatly improved.

The monitorial system of teaching introduced into England by Dr. Andrew Bell (1753–1832) and Joseph Lancaster (1778–1838) was the germ of the present excellent normal system of Great Britain and Ireland. The lives and educational labors of these men have been presented under their names in the *ENCYCLOPÆDIA BRITANNICA*, to which the reader is referred. But even Bell and Lancaster had been anticipated in the monitorial or mutual help plan of teaching; for Pietro della Valle (*Il Pellegrino*), whose *Travels* in Turkey, Egypt, Persia, and India were translated into English in 1665, mentions, among the customs which he noticed in the East, the practice of children teaching one another. In 1780, according to Count Laborde, in his *Plan d'Education pour les enfans pauvres*, the mutual instruction system was, to some extent, tried by the Chevalier Paulet in France.

The monitorial system became for a time exceedingly popular in Great Britain and the United States; but it had one fatal defect: the boys and girls were too immature to avail themselves of the normal methods of the masters. Germany was the first country to abandon the system of mutual help and to press forward the establishment of normal schools. The Bell and Lancaster system, with all its faults, accomplished one great good: it opened the eyes of the British and American educators to the necessity of educating and training teachers in schools specially established for that purpose.

In 1808 the British and Foreign School Society established in London a model school and teachers' class for the "training of schoolmasters." In the beginning, its plan was very simple: it admitted a certain number of persons every year to observe, learn, and practise the methods of classification and instruction pursued there. Its accommodations as a normal school were insufficient, even on the plan of observation and practice pursued, until 1842, when a new building was completed at an expense of £21,433. In the meantime the National Society, which was more closely connected with the Church of England, was pursuing a similar plan in its model school at Westminster; and the necessity of training well-qualified teachers by means of a special course of instruction and practice was ably discussed, and the mode and results of such training as exhibited on the Continent, and especially in Prussia, were ably advocated in parliament, pamphlets, reviews, and the daily press. Lord Brougham, in his whole public life an eloquent advocate of popular education, remarked in a speech in the House of Lords in 1835, "These seminaries for training masters are an invaluable gift to mankind and lead to the indefinite improvement of education. It is this above all things we ought to labor to introduce into our system. . . .

Place normal schools—seminaries for training teachers—in a few such places as London, York, Liverpool, Durham, and Exeter, and you will yearly qualify 500

persons fitted for diffusing a perfect system of instruction all over the country."

Owing to difficulties arising out of religious questions, the advocates of the normal system were unable to establish a system of national education which would provide for the training of schoolmasters. The National Society, however, erected a training college for 74 masters of schools in Chelsea, which was completed in 1842, at an expense of £23,651. At Battersea a training school was established by government officials to supply schools of industry for pauper children and reformatory schools for juvenile criminals, with properly qualified teachers, and at the same time to give an example of normal education, comprising the formation of character, the development of the intelligence, appropriate technical instruction, and the acquisition of method and practical skill in conducting an elementary school. After the methods and results had received the repeated and emphatic commendation of the Queen's inspectors, the founders transferred the institution to the management of the National Society.

The success of these experiments dissipated the prejudices against normal schools as a foreign institution, and inspired general confidence in their tendencies. The different religious denominations, which had opposed the plan of the Committee of Council in 1839, now came forward to found training colleges for teachers of schools in their several connections. In 1852 there were 34 normal schools or training colleges in England and Wales, erected at an expense of £350,000, of which the government contributed about one-half. According to the latest reports there are at present 44 of these training colleges in England and Wales.

In Scotland the first attempt to train teachers in the principles and practice of their art was made by the Education Committee of the Church of Scotland in 1826 by placing a few teachers, appointed to their schools in the Highlands, for a short course of observation, instruction, and practice in one of their best-conducted schools in Edinburgh. This plan was enlarged and improved in 1838; and in 1846 a building was erected for a normal school in Castle Place, at an expense of £10,000. In the meantime Mr. Stow, in 1836, commenced at Glasgow a similar enterprise at his own risk to train teachers on a system of instruction somewhat peculiar. The disruption of the Church of Scotland and the organization of the Free Church led to the establishment of two other normal schools, one at Edinburgh, in 1849, and the other at Glasgow, in 1852, at an aggregate expense of £20,000.

The Commissioners of National Education in Ireland have always encouraged monitorial teaching. They never contemplated, however, conducting a large school solely by monitorial assistance; nor did they ever permit their monitors to forget that they were pupils. The first regular monitors in the service of the board were those in the model schools of Dublin, as far back as March, 1833. These monitors were simply pupil-teachers receiving normal instruction in the theory and practice of teaching. There is one great normal school in Dublin, with model schools or schools of practice attached. There is also a normal agricultural school at Glasnevin. Besides these, and in connection with them, there are several model schools in different parts of the country.

The first suggestion of a normal school in the United States occurs in the *Massachusetts Magazine* for 1789, supposed to have been written by Elisha Ticknor, in which he recommends the abolition of town grammar schools and the establishment of a grammar school in each county, in which should be taught English grammar, Latin, Greek, rhetoric, geography, mathematics, etc., in order to fit young gentlemen for college and school-keeping. He also recommended an able preceptor who, with a board of overseers, should annually examine young gentlemen designed for schoolmasters.

The first normal school established in the United States, avowedly for the instruction of those who desired to become teachers, was the school at Concord, Vt., instituted in 1823 by the Rev. Samuel Read Hall. For seven years he delivered a series of lectures on school-keeping and school government; and to illustrate his theories he established a model school for practice. This pioneer of American Normal Schools continued to labor in this special field until 1840—a teacher of teachers—at Concord, from 1823 to 1830; and at Andover, Mass., as principal of the Teachers' Seminary, from 1830 to 1835; and at Plymouth, N. H., from 1837 to 1840.

The first formal effort to establish a normal school in Massachusetts was made by James G. Carter, in Lancaster, in 1827, to realize the plan of such an institution which he had presented in his *Essays on Popular Education*, first published in the *Boston Patriot* in 1824-5, and afterwards issued in pamphlet form in 1826. The town of Lancaster appropriated a portion of land and the use of an academy building to aid him in carrying out the enterprise. He memorialized the Legislature for aid for a seminary for particular instruction in the science of education. The governor in his message recommended the establishment of a normal school, and a select committee made a favorable report. But the movement was in advance of public opinion as represented in the Legislature, and failed for the time being. Mr. Carter, however, continued his private normal school and turned out many excellent teachers for the district schools of New England.

In 1838, in a communication made by Hon. Horace Mann, secretary of the board of education, to the Legislature of Massachusetts, it was stated that private munificence had placed at his disposal the sum of \$10,000 to be expended under the direction of the board for qualifying teachers for the common schools, on condition that the Legislature would place in the hands of the board an equal sum to be expended for the same purpose. Resolutions were passed accepting the proposition and authorizing the governor to draw his warrant for \$10,000 for the purpose specified. Mr. Mann, who had previously made himself familiar with the workings of the normal system in Europe, took a most active part in the establishment of the State normal schools.

After mature deliberation the board decided to establish three normal schools, one for the north-eastern, one for the south-eastern, and one for the western part of the State. Accordingly one was opened on the 3d of July, 1839, at Lexington; but the school outgrew its accommodations and was removed to West Newton in the same county, in 1844, and afterwards to Framingham in 1853. The second normal school was opened at Barré, Sept. 4, 1839. This school has since been removed to Westfield on account of the insufficiency of the accommodations at Barré. The third normal school was opened at Bridgewater on the 9th of September, 1840, and has never changed its location. The school at Framingham is appropriated exclusively to females; and those at Bridgewater and Westfield admit both sexes.

As most of the normal schools of the United States have been modelled, to a great extent, on the plan of the Massachusetts State normal schools, just as the latter were, as far as feasible, modelled on the plan of the Prussian schools, a statement of the course of study adopted for the three new schools will give a fair idea of the breadth and scope of the instruction.

The Course of Study.—The studies first attended to in the State normal schools are those which the law requires to be taught in the district schools, namely: orthography, reading, writing, English grammar, geography, and arithmetic. When these are mastered those of a higher order are progressively taken. For those who remain longer than one year the following course was arranged:

(1) Orthography, reading, grammar, composition,

rhetoric, and logic. (2) Writing and drawing. (3) Arithmetic (mental and written), algebra, geometry, book-keeping, navigation, and surveying. (4) Geography (ancient and modern), with chronology, statistics, and general history. (5) Human physiology and hygiene or the laws of health. (6) Mental philosophy. (7) Music. (8) Constitutional history of Massachusetts and of the United States. (9) Natural philosophy and astronomy. (10) Natural history. (11) The principles of piety and morality common to all sects of Christians. (12) The science and art of teaching with reference to all the above-named studies. Religious exercises: A portion of the Scriptures is required to be read daily in every State normal school.

In addition to the three State normal schools already mentioned another was established in 1854 at Salem; another, in 1870, at Cambridge; and another, in 1874, at Worcester. Besides these there is a city normal school in Boston, instituted in 1852.

Among the earliest and most earnest advocates of legislative provision for the professional training of teachers stands the name of Gov. De Witt Clinton. In his message to the Legislature of New York, in 1825, he recommended to their consideration the education of competent teachers; and again in the next year he said: "I therefore recommend a seminary for the education of teachers in those useful branches of knowledge which are proper to engraft on elementary attainments." In his message of 1828 he again urged the subject on the attention of the Legislature. Through the efforts of John C. Spencer and Gen. John A. Dix, the Board of Regents of the University of New York, in May, 1834, were authorized to apply a part of the income to the literature fund to the education of common-school teachers. Again, in 1836, the State Superintendent, Gen. Dix, adverted to the fact that in the adoption of this system the Legislature has merely provided for the more complete execution of a design long contemplated so far as respects the employment of the academies for normal school purposes. He stated in his report that "the propriety of founding separate institutions upon the model of the seminaries for teachers in Prussia was for several years a subject of public discussion in this State."

The Committee on Colleges, Academies, and Common Schools made a report to the Legislature of New York, in 1844, in which it was recommended to establish a normal school in Albany. By means of a sub-committee the committee had examined the normal schools of Massachusetts and inquired into their operations in other countries. The recommendation of the committee was adopted by an almost unanimous vote, and \$9600 was appropriated for the first year and \$10,000 annually for five years thereafter in appropriations for the support of the school. The city of Albany tendered the use of a suitable building, free of rent, and the school was organized and commenced the business of instruction December, 1844. Since the establishment of the first normal school at Albany the following State normal schools have been instituted: One at Oswego in 1861, one at Brockport in 1867, one at Fredonia in 1868, one at Cortland and one at Potsdam in 1869, one at Geneseo and one at Buffalo in 1871. There is also a training school in connection with the high-school at Syracuse. In addition to these nine normal schools the city of New York supports at an annual expense of \$100,000 a normal college for the education of female teachers, which is, perhaps, the largest and best equipped institution of the kind in the United States. It has a large school of practice attached to it, and the grounds and buildings are estimated to be worth at least a million of dollars. The college was established in 1870, mainly owing to the efforts of Mr. William Wood, who, as commissioner, in his visits to the common schools, saw the necessity of educating teachers for their highly important work.

From Massachusetts and New York the normal

system has gradually spread all over the United States, until there were, in 1886, 117 public normal schools, with 1115 instructors and 31,801 students. Ninety-six of these are supported by the States and 21 by the cities. There were also, in 1886, 36 private normal schools, with 279 instructors and 8524 students. These schools are distributed among the States and Territories as follows:

States.	Public.	Private.	States.	Public.	Private.
Alabama.....	6	2	Nebraska.....	2	1
Arkansas.....	1	1	New Hampshire...	2	0
California.....	3	2	New Jersey.....	3	1

Barnard's *Journal of Education*; Dr. James Phillips Kay's *Report to the British Parliament on the "Prussian System of Teachers' Seminaries;"* Guizot's *Report, as Minister of Public Instruction in France, on the Normal Schools of Prussia;* the *Report of the Prussian System to the Massachusetts Board by Dr. Julius, of Hamburg;* Horace Mann's *Report to the Massachusetts Legislature on the Establishment of Normal Schools;* the Messages of Gov. De Witt Clinton recommending the Normal System; A. D. Bache's *Report on the Normal Schools of France and Germany;* the *Reports of U. S. Commissioner of Education.* (T. H.)

NORRISTOWN, a borough of Pennsylvania, county-seat of Montgomery co., is on the east bank of the Schuylkill River, 16 miles N. W. of Philadelphia, with which it is connected by the Reading and Schuylkill Valley Railroads. It is a handsome town, built on hills. It has a fine marble court-house, opera-house, public library, jail, 2 national banks, 1 other bank, 15 churches, Treemount Seminary, and several public schools. The industrial works comprise rolling-mills, foundries, cotton- and woollen-mills, glass-works, tack-factory, flour-mills, etc. Two daily and 5 weekly newspapers are published here. The State Asylum for the Insane for the Eastern District is located here. On the west side of the river is the borough of Bridgeport, with which Norristown is connected by three bridges. Population of Norristown in 1880 was 13,063; of Bridgeport, 1802.

NORTH ADAMS, a manufacturing village of Berkshire co., Mass., is on the Hoosac River, at the west end of the Hoosac Tunnel, 36 miles E. of Albany. This tunnel, perforated through the Hoosac Mountains, is 5 miles long and is owned by the State. It is used jointly by 5 railroads, which pass through North Adams and connect it with Troy and Albany on the west and Boston and other cities on the east. North Adams has 8 hotels, 2 national and 2 other banks, 3 weekly newspapers, 9 churches, graded schools and academies. The industries comprise 1 foundry, 4 woollen- and 7 cotton-mills, 8 shoe-factories, 2 printcloth-factories, and other manufactures. The village is picturesque in situation, being surrounded by high hills and beautiful scenery. It has gas- and water-

works. Its property is valued at \$5,500,000: its public debt is \$80,000, and the yearly expenses \$119,000. Its population in 1880 was 10,191, but a local census in 1886 gave 14,250.

NORTHAMPTON, a city of Massachusetts, shire-town of Hampshire co., is on the W. bank of the Connecticut River, 17 miles N. of Springfield and 80 miles W. of Boston. Three railroads pass through it, and there is also a street railway to Florence. The city has excellent water-works, electric lights, and a fire department. There are 3 national and 3 savings banks; 10 churches and 2 newspaper offices. A stream affords abundant water-power which is utilized in manufacturing paper, silk, and cotton goods. Other manufactures are cutlery, sewing-machines, brushes, etc. Besides the State Lunatic Asylum Northampton contains the Clarke institute for deaf-mutes, the John Clarke library with 20,000 volumes, the Smith Charities, and Smith College (q. v.), an institution for the higher education of women.

NORTH CAROLINA. There has been no official

census taken since 1880. See Vol. XVII. p. 558 (p. 572 Am. Rep.).

The population of the State in 1888 is probably 1,800,000. There is but little emigration from the State. The immigration, mainly from the Northern and North-western States, more than balances the losses. Some of the cities and towns have increased rapidly in numbers and wealth. The following table shows the growth of the most prominent:

	1888.	1880.
Raleigh.....	15,800	9,285
Wilmington.....	23,000	17,350
Charlotte.....	12,000	7,054
Asheville.....	10,000	2,616
Winston and Salem.....	10,000	4,194
Durham.....	7,500	2,041
Fayetteville.....	6,000	3,485
Goldsboro.....	6,000	3,286
Greensboro.....	6,000	2,005
Reidsville.....	5,000	1,316
Henderson.....	5,000	1,421

The public charitable and penal institutions of the State are in good condition and well managed. There are three asylums for the insane—one at Raleigh, one at Morganton, both for whites only, and one at Goldsboro for the colored. That at Raleigh, Eugene Grissom, M. D., LL. D., superintendent, has 290 patients. It cost \$250,000. The Western North Carolina Asylum cost \$450,000 and has 420 patients; superintendent, Dr. P. L. Murphy. The Eastern North Carolina Asylum, Dr. J. M. Miller, superintendent, for the colored only, cost \$78,000. It now contains 196 patients. The total number of insane in the State, including harmless incurables, is estimated at about 3000. The asylums for the blind, deaf, and dumb are at Raleigh, one for the white and the other for the colored, both under Mr. W. J. Young, superintendent. The former has 76 deaf and dumb, and 59 blind; the latter 30 deaf and dumb, and 23 blind. The buildings cost about \$100,000. The penitentiary is unfinished. It has 1471 convicts, of whom 184 are within the walls, the remainder on outside works, mainly constructing railroads. The State aids the Oxford Orphan Asylum by annual grant of \$10,000. It has 240 orphans and is under the charge of the Masonic fraternity.

In addition to a building purchased for the agricultural department, which contains its museum and State chemical laboratory, the State has recently erected a structure for the public library and Supreme Court rooms, and also a mansion for the use of the governor.

The Western North Carolina Insane Asylum and

the Eastern North Carolina Insane Asylum have also recently been completed. The State University has likewise added about \$40,000 of new structures, consisting of laboratories and a capacious auditorium. The United States has since 1880 completed new courts and post-offices at Raleigh and Greensboro, and others at Wilmington, Asheville, and Charlotte are to be commenced at once.

Finances.—The valuation of real property in the State for taxation is \$126,883,382; personal property, \$75,561,351; total, \$202,444,733, an increase over 1880 of \$46,344,551. The rate of taxation is 20 cents on the \$100 value for State purposes, other than educational. The total amount of taxes for the State on property, licenses, etc., is \$560,369. Total amount for the counties is \$920,077. In addition to this \$605,203 is raised for school purposes.

The compromise offered by the State in regard to the public debt has been accepted by most of its recognized creditors and has reduced the acknowledged debt to \$6,404,511. The interest of \$2,795,000 of this is provided for by dividends of the railroad stock, for which bonds were issued, leaving \$3,609,511 bearing 4 per cent. interest to be paid by taxation. This does not include a large amount (about \$20,000,000) of "special tax bonds," which have been repudiated by constitutional amendment as fraudulent. The capital of the national banks of the State is \$2,312,280, and they issue only \$795,710 of circulating notes. The individual deposits are \$2,928,300.

Manufactures.—In the absence of official returns only partial statistics can be given of the progress of the State in manufactures. The latest estimates show 80 cotton-factories, operating 4671 looms and 199,433 spindles. They have more than doubled since the census of 1880. The tobacco-factories have largely increased also. A considerable number of establishments for the manufacture of furniture, spokes, handles, and other wood-work have sprung up. There are hopeful indications that the extensive water-power of the State and other advantages for manufacturing are to be utilized. The forests of oak, cherry, walnut, white and spruce pine, and poplar, in the mountain section, are being cut by lumbermen from the North and North-west, and largely exported. A topographic survey has been made by the U. S. Geological Survey, and it is ascertained that deposits of valuable minerals and ores exist in large quantities. The mountain-sides are admirably adapted to the growth of fruits and the grasses. Nearly 7000 square miles of rich territory, heretofore almost unknown, now invite emigration.

Agriculture.—The principal farming products of the State in 1887 were as follows: Indian corn, 35,830,000 bushels; wheat, 5,094,000; oats, 8,504,000; tobacco (in 1886), 31,559,000 pounds; cotton, 1,066,000 acres; production about 420,000 bales, estimated. Of live-stock there were: Horses, 149,708; mules, 89,945; milch-cows, 243,715; oxen and other cattle, 419,383; sheep, 427,560; swine, 1,266,438. There has been much improvement in the way of introduction of fine breeds of cattle and horses, the establishment of stock-and dairy-farms, the purchase of labor-saving machinery, the increase of acres devoted to grasses, the adoption of the intensive system of farming, and the use of home-made fertilizers. Much of this improvement has been caused by intelligent work of the agricultural department, including the fertilizer control and experiment station, which by analysis of fertilizers and dissemination of information concerning their constituents, and by furnishing formulas for home-made manures, have done much towards enlightening the people. An experiment-farm has recently been opened, and extensive experiments promoted. The importance of the work of the agricultural department may be inferred from the fact that prior to its establishment there were 125 brands of fertilizers sold in the State, of which 80 have been driven out on account of their inferiority, and the remainder greatly improved. The

cost of fertilizers in 1887 was 25 per cent. less than in 1880, while the quality improved 14 per cent. The phosphate-beds of the State have been explored and mapped, and, though inferior to those of South Carolina, will hereafter be a source of wealth. The marls of the State have been analyzed and their use increased. The establishment of fertilizer-factories has been stimulated, there now being nine. The pyrites-deposits of the State have been explored and samples analyzed. Analyses for the board of health have been made of drinking-water and other substances, and noxious ingredients ascertained.

An exploration of the coal-fields of the State has been made under authority of the board, and a report published by Dr. H. M. Chance. A report was likewise published in *Mining in North Carolina*, by Dr. George B. Hanna. Under the direction of Lieut. Winslow, U. S. N., the oyster-beds in the extensive sounds and inlets of the coast have been explored and mapped, and a comprehensive report of the same published. Under Mr. S. G. Worth, Fish Commissioner, hatcheries have been operated for increasing the supply of shad, herring, rock, and other fish in North Carolina waters. Under Mr. J. L. Patrick, Commissioner of Emigration, valuable publications have been made and distributed for the purpose of making known the resources of the State. Other publications under authority of the board are: *A Description of the Minerals and Mineral Deposits of North Carolina*, by F. A. Genth and W. C. Kerr, the latter being the late State geologist; hand-books and bulletins, containing miscellaneous information about the State, published in 1883 and 1886; *Annual Reports and Bulletins* of the agricultural experimentation, from 1877 to 1887; *Report on the Ores of North Carolina*, by W. C. Kerr and G. B. Hanna, 1887, being chapter II. of Kerr's *Geology of North Carolina*, vol. II., now in progress of publication, under the editorial supervision of Prof. Joseph A. Holmes. It may here be noted that since the death of Prof. Kerr the State geological work has been discontinued.

The activity of the farming class is shown by the increase of county and district agricultural societies, and by the rapid spread of the society called the Farmers' Alliance. There are 1198 organizations, with about 50,000 members. L. L. Polk is president of the Inter-State Farmers' Association. The grangers have also an organization, W. R. Williams being master.

By act of the General Assembly of 1887 a bureau of labor statistics has been created. The commissioner, Mr. W. U. Jones, has made a report, giving valuable but incomplete information on the subject.

Climate.—Much attention has been recently directed to parts of North Carolina as health-resorts. The territory on both flanks of the Blue Ridge, and the sand-hills in the southern middle section, are considered favorable for the cure of pulmonary diseases, and are much resorted to for the purpose. The mountains and the sea-coast are likewise attracting many summer visitors on account of the beautiful scenery and pleasant climate of the former, and sea-breezes and surf-bathing of the latter.

Railroads.—A marked impetus has since 1880 been given to the development of the State by branch railroads, connecting with the main lines. These main lines are: 1. The Richmond and Danville system, running through the State by way of Greensboro and Charlotte, from north to south, and by way of Salisbury and Asheville into Tennessee. 2. The Atlantic Coast Line system, bisecting the eastern half of the State, by way of Weldon and Wilmington. 3. The Seaboard Air Line system, running from Norfolk by way of Raleigh, and now building an extension to Atlanta. The first has recently added to its system 11 branches, aggregating 308 miles finished, and is constructing 130 more. The Atlantic Coast Line has finished 227 miles of branch roads, and is building 55 in

addition. The Seaboard Air Line has finished 166 miles. Other important new lines are the Cape Fear and Yadkin Valley, extending from a point on the Norfolk and Western Railroad, west of the Blue Ridge, to Wilmington, of which 130 miles are completed; the Charleston, Cumberland Gap, and Cincinnati Railroad, of which about 75 miles will be in the mountain and Piedmont district of North Carolina; the Carolina, Knoxville, and Cumberland Gap Railroad, of which there will be about 60 miles in the mountain regions. The total mileage of finished railroads may be stated at 2450, with 550 in process of construction. Other lines in addition are projected, with fair prospects of success.

Education.—The public school system is still embarrassed by the loss of the school-fund during the civil war, and by the poverty of the people. The constitution of the State does not permit taxes for general purposes higher than \$2 on the poll, and 66½ cents on the \$100 value of property. As the valuation of property is low, it is impossible at present to provide by taxation for keeping the schools open for the proper length of time. The total amount of money collected for 1887 from this source chiefly was \$647,407. The school-property is valued at \$634,356. The number of whites who attended in 1887 was 202,134; the number of colored, 123,145. The number of children of school age is 353,481 white, 212,781 colored. There are 8 normal schools for whites in different parts of the State, held during the summer for from 3 to 5 weeks each. There are 5 normal schools for the colored, lasting from 8 to 10 months. Excellent graded schools, supported by special city taxation, are in Wilmington, Goldsboro, Raleigh, Durham, Fayetteville, Winston, Salisbury, Charlotte, and Asheville. The State has devoted the public swamp-lands to the school-fund. Recent surveys show that there are from 600,000 to 700,000 acres of these lands, some of which are of great intrinsic value; but the expense of draining them is so great that they cannot be brought extensively into market until the other lands of the State greatly appreciate. The board of education is engaged now in cutting canals for drainage and building roads through these swamps.

The State University turns out annually many teachers for the schools of the State. Good service in this regard is likewise rendered by Davidson, Wake Forest, Trinity, and other denominational colleges, and by the best of the high-schools. These colleges, as well as the university, have conspicuously increased their endowments, corps of professors, and apparatus for instruction, and are constantly increasing their patronage. There are also in the State many classical schools of the highest rank, some of them drawing their patronage from distant States. Notwithstanding these aids to higher education, parts of the State are deficient in good schools. In this connection should be mentioned a strong demand for industrial education. This has culminated in the establishment of an agricultural and mechanical college, the buildings of which are now being erected at Raleigh. It is contemplated that all the students of this college shall regularly be employed at manual labor, while carrying on a course of theoretical study.

Sea-Ports.—The harbor of Wilmington, on the lower Cape Fear, has been much improved by the United States, so that now vessels drawing 18 to 20 feet can come to its wharves. This, with its early connection with the railroads of the North-west, by the completion of the Cape Fear and Yadkin Valley Railroad, will bring prosperity to this city. Some work has been done under the authority of the general government in various rivers and inlets of the State; but there is a deficiency of good harbors, which drives its products to markets beyond its borders.

North Carolina has been making steady progress in recent years, and its natural resources, its orderly population, its singularly agreeable and healthful cli-

mate, and its proximity to the great centres of population and wealth of the North Atlantic, should insure a marked advance in prosperity. (K. P. B.)

NORTH CAROLINA, UNIVERSITY OF. The constitution of North Carolina directed the establishment of a university, and a charter was accordingly granted, Dec. 11, 1789, to forty corporators, the first being Gov. Samuel Johnson. A supplemental act bestowed on the institution all arrears due to the State from receiving officers up to Jan. 1, 1783, and all escheated property. Unclaimed land-warrants granted to soldiers of the Revolution were located in Tennessee, and its General Assembly allowed to the University of North Carolina title to one-third. The trustees met at Fayetteville, Dec. 13, 1790, and chose Gen. Wm. Lenoir (1751-1839) president. In November, 1792, a committee selected New Hope Chapel Hill as the site for the university, 1280 acres there having been offered as a donation. The village was marked out and the corner-stone of the first university building laid by Gov. W. Richardson Davie, on Oct. 12, 1793. Chapel Hill is 12 miles south of Hillsborough, the county-seat of Orange, and 28 miles W. N. W. of Raleigh. Gov. Benjamin Smith in 1790 had given a warrant for 20,000 acres of land in Tennessee, which was sold about 1837 for \$14,000. In 1797 Gen. Thomas Person gave \$1025 for the completion of the "Old Chapel" or "Person Hall," and others subscribed \$7648 for the erection of buildings. A loan of \$10,000 from the General Assembly was afterwards made a gift.

At the opening of the university in 1795 David Kerr, a graduate of Trinity College, Dublin, was made professor of ancient languages, and Charles W. Harris, a graduate of Princeton College, professor of mathematics. A year later Rev. Joseph Caldwell, D. D., LL. D., succeeded the latter in his professorship and in 1804 was made president. He held that position until his death in 1835, with the exception of the years 1812-16, during which time Rev. Dr. Robert H. Chapman, of Virginia, was president. In 1809-10 sundry citizens subscribed about \$10,535 for the erection of buildings. David L. Swain, LL. D., who had been governor of the State from 1832 to 1835, then became president of the university, and remained in office till 1868. Under his direction the university had at the outbreak of the civil war nearly 500 students. It was the only Southern institution of its rank that continued its exercises throughout the war. The escheated land-warrants had after many years realized for the university about \$150,000, but this amount was lost during the civil war by the insolvency of the bank in whose stock it was invested. Other smaller sums had been received from time to time from escheats in North Carolina, arrears, confiscations, etc., amounting in all to \$134,000, which had been used for buildings and current expenses. The United States by the act of 1862 gave to the State for the establishment of a college of agriculture and the mechanic arts land-scrip for 270,000 acres. This was sold in 1867 at the market price of 50 cents per acre, but the investment of the funds proved unfortunate.

On the adoption of the State constitution of 1868, during the reconstruction period, the faculty of the university was displaced by a new corps, of which Rev. Solomon Pool was president, but no exercises were held after 1870. In 1875, in pursuance of a constitutional amendment, new trustees were elected by the General Assembly, and a new faculty was installed, with Rev. Charles Phillips, D. D., LL. D., as presiding professor. In 1876 Kemp P. Battle, LL. D., who had formerly been State treasurer, was elected president, and has since discharged the duties of that office. By his efforts about \$18,000 had been given by citizens for the revival of the university. The State also gave a certificate for \$125,000, on which 6 per cent. was paid semi-annually. Hon. B. F. Moore, of Raleigh, bequeathed in 1878 the sum of \$5000, the interest of which is to be applied to defraying the tuition of students.

Rev. Charles F. Deems, D. D., of New York, formerly a professor in the university, established in 1880 a fund to aid indigent students, and Mr. W. H. Vanderbilt increased this fund, which now amounts to \$13,000. In 1885 Miss Mary Ruffin Smith, residing near Chapel Hill, bequeathed to the university a plantation in Chatham co., called Jones' Grove, and valued at \$15,000. The rent of the property, or interest on the proceeds, if the property be sold, is to be applied by the faculty in the education of suitable students. Mrs. C. P. Spencer, daughter of Rev. Dr. James Phillips, presented to the university 1000 volumes from his library.

Government.—The university is by the State constitution entrusted to the General Assembly. That body has committed it to 80 trustees, who are usually chosen from different sections of the State. They hold office for eight years, one-fourth being chosen every two years. The governor is *ex officio* president of the board, though not necessarily a member. Ten members constitute a quorum. At the annual meeting, held in January, an executive committee of seven trustees is appointed, who hold office for one year and have all the power not expressly forbidden by the board. As these are elected on account of convenient access to the city of Raleigh, continuity of wise and efficient management is secured. The offices of secretary and treasurer are combined, and this officer now, Hon. W. L. Saunders, secretary of state, resides in Raleigh, and is a member of the executive committee.

The Faculty consists of the president, professors, and assistant professors, their votes being equal. The president is a member of the board of trustees, whose communications with the board go through him. Although his powers have never been defined by law, courtesy and custom concede to him sufficient authority.

Among the best known members of the faculty of the past have been Presidents Caldwell and Swain, Ethan A. Allen and Denison Olmsted, afterwards of Yale University, Dr. Wm. Hooper, Dr. Elisha Mitchell, who lost his life in exploring the mountain named from him, the highest peak of the Alleghanies, Rev. Dr. James and Charles Phillips, professors of mathematics, Walker Anderson, afterwards Chief-Justice of Florida, Dr. Wm. M. Green, afterwards Bishop of Mississippi, Dr. Charles F. Deems, now of the Church of the Strangers, New York, Nicholas M. Hentz, Rev. Dr. F. M. Hubbard, Wm. H. Battle, LL. D., Judge of the Supreme Court of North Carolina, B. F. Hedrick.

Under Prof. Olmsted, in 1824, was organized the geological survey of the State, believed to be the first in the Union by public authority. In 1831 Pres. Caldwell built the first astronomical observatory in this country, but its operations were discontinued after his death in 1835.

The university has been of great service to public-school education by successful inauguration of summer normal schools, now common in the South. A great impetus was thereby given to the training of teachers, and the establishment of graded schools.

Instruction.—Originally Latin, Greek, and mathematics were the studies principally attended to. This system continued uninterruptedly until January, 1854, when a school was established for the "application of science to arts," with Dr. Charles Phillips as professor of civil engineering, and Benjamin F. Hedrick as professor of agricultural chemistry.

In 1875 the university was reorganized on the basis of largely increased liberty of election and much greater proportion of scientific and linguistic studies. Three courses lead to degrees; one to that of bachelor of arts (A. B.), including both Latin and Greek; another to that of bachelor of philosophy (Ph. B.), with Latin or Greek replaced by French or German; and the third replacing both the classics with French, German, and scientific studies, leading to the degree of bachelor of science (S. B.). Besides these, students are allowed to

take an optional course, leading to no degree, but in number of hours employed equivalent to the regular courses. The classical course is "the old curriculum," but with a larger proportion of scientific studies. The degrees of doctor of philosophy (Ph. D.), master of arts (A. M.), and master of science (M. S.), are conferred upon students who have completed post-graduate studies prescribed by the faculty. The first (Ph. D.) requires the equivalent of two years' study in two departments, and the others the equivalent of one year's study in three departments. A course in law leads to the degree of bachelor of law (B. L.).

In 1881 the General Assembly appropriated \$5000 per annum, and in 1885 \$15,000 per annum in addition, so that the university had an income of \$27,500 per annum, besides tuition fees. The trustees were thus enabled to add seven more professorships. In 1887 the General Assembly concluding to establish a separate agricultural and mechanical college, took away the land-scrip fund, yielding \$7500 a year, and it became necessary to abolish three of the professorships. Its faculty now consists of fifteen professors and assistants.

A special course of three months is offered, each spring, to teachers who desire to extend their education. The general studies of special benefit to farmers, merchants, manufacturers, and other business men, have been grouped into a small course of two years, for the benefit of students who are unable to complete a full course. For students of medicine there is a short course of two years, comprising such general studies as are essential to the education of a physician, and such special studies in chemistry, botany, zoölogy, physiology, etc., as are included in the curriculum of all medical colleges. No diploma is granted.

Societies.—In connection with the university are the Dialectic and Philanthropic Literary Societies, to one of which each student is required to attach himself, unless excused for special reasons. The halls of these societies are commodious and elegantly furnished. The Elisha Mitchell Scientific Society was established in October, 1883. Its aim is to stimulate individual workers, and to enable the members to keep up with the growth of science. It is a State society, and includes among its members all scientific workers in the State. The students are allowed all the advantages of the society. A semi-annual journal is published, containing accounts of the meetings and all original papers. Over 500 pages have thus been published. This journal is exchanged for the publications of more than 100 other learned bodies and scientific societies. Occasional lectures on popular scientific subjects are delivered by resident members of the society and lecturers invited from a distance.

A Shakspeare Club was organized in November, 1886, for the critical study of Shakspeare and other dramatists.

The North Carolina Historical Society is engaged in the study of State history and the collection of documents and material for its illustration. Meetings, as a rule, are held monthly.

A Seminary of Literature and Philology has been formed for the benefit of students who feel a special interest in literary work; and to promote research along special lines with more thoroughness and individuality than is possible in the class-room. The professors in the several departments of the university, besides guiding and assisting in the regular work of the seminary, present from time to time the results of their own special labors. At each meeting reports are made concerning new publications, new theories, and methods, new achievements in every department of literary work.

The University Magazine is published six times during the year, under the auspices of the Philanthropic and Dialectic Societies.

There is a branch of the Young Men's Christian Association among the students. It has many members of spirit and activity, and its influence for good is very marked.

Museums.—Every scientific department of the university is equipped with a museum of specimens for laboratory work; and besides these working museums there is a large and valuable collection of specimens in botany, geology, mineralogy, zoölogy, and entomology, carefully arranged for exhibition in the university museum.

Libraries.—The Philanthropic and Dialectic University Libraries have been consolidated and carefully arranged in Smith Hall. The consolidated library is open daily, except Sunday, for the use of students. It contains 25,000 volumes and 5000 pamphlets, illustrating every department of literature and science.

Lectures.—In addition to the lectures presented before the Mitchell Scientific Society, the Shakspeare Club, and the Historical Society, the university sustains a course of public lectures.

Campus and Buildings.—The campus is a fine grove of old forest trees, chiefly oak and hickory, fifty acres enclosed, beautifully undulating. Adjoining are about 500 acres of woodland, belonging to the university. The buildings of the university are nine in number, affording ample accommodation in the way of dormitories, lecture-halls, laboratories, etc. (K. P. B.)

NORTHCOTE, SIR STAFFORD HENRY (1818-1887), became Earl of Iddlesleigh about two years before his death. He was born at London, Oct. 27, 1818, and was educated at Eton and Balliol College, Oxford. He was private secretary to Mr. Gladstone when the latter was president of the Board of Trade, 1843-45. He was called to the bar in 1847 and was one of the secretaries of the World's Fair at London in 1851. On the death of his father in that year he became the eighth baronet. The investigation of the civil service next occupied his attention, and in 1854, with Sir Charles E. Trevelyan, he made a report which was the basis of the subsequent reform opening all the lower offices to competitive examination. In 1855 his parliamentary career began. As a Conservative he represented Dudley until 1858, then Stamford until 1866, and then North Devon until 1885, when he took his seat in the House of Lords. He was financial secretary to the treasury, 1856-59; president of the Board of Trade under Lord Derby, 1866-67; secretary of state for India, 1867-68. The Conservatives then retiring, Lord Northcote was made governor of the Hudson Bay Company. In 1871 he was a member of the High Joint Commission on the Alabama Claims at Washington.

In March, 1874, when the Conservative party returned to power under Disraeli, Lord Northcote became chancellor of the exchequer. He had learned financial management from Mr. Gladstone and was the most successful of the Conservative leaders in this department. His administration was marked by the extinction of the sugar-duties and the establishment of an effective sinking-fund. Disraeli being elevated to the peerage, Lord Northcote became the Conservative leader in the House of Commons. He was noted for his conciliatory disposition and affable manners. While he won the favor of his opponents he did not always gratify the desire of his partisans. In 1880 the Liberals again had a majority in the House and Northcote remained leader of the opposition until 1885. When Mr. Gladstone was defeated in that year Lord Iddlesleigh, having just succeeded to his title, entered Lord Salisbury's ministry as first Lord of the Treasury. He was thrown out a few months later, but in 1886, when Lord Salisbury returned to power through the change caused by Mr. Gladstone's espousing the Irish demand for Home Rule, Lord Iddlesleigh was made secretary of state for foreign affairs. He died suddenly in London, Jan. 12, 1887. He had published several speeches on financial and political topics, and *Twenty Years of Financial Policy, 1842-61* (1862). As Lord Rector of the University of Edinburgh he delivered an interesting address on *Desultory Reading* (1836).

NORTH-WESTERN UNIVERSITY. This institution of learning, at Evanston, Ill., obtained its charter Jan. 28, 1851. Its founders, chiefly citizens of Chicago, intended to establish an institution devoted to the interests of Christian learning under the patronage of the Methodist Episcopal Church. On June 14, 1851, the trustees organized, and resolved to open a preparatory school in Chicago. Rev. Clark T. Hinman, D. D., LL. D., was elected the first president, June 23, 1853, after the trustees had decided to open an institution of higher grade. The site having been unanimously selected, a purchase was made, of 379 acres of land, for \$25,000. A town including this tract of land was organized in 1857, and called Evanston, in honor of John Evans, M. D. Subsequently, large additions were made to the land of the university.

Several amendments were made to the original charter, the most important of which enacted that "no spirituous, vinous, or fermented liquors shall be sold, under license or otherwise, within four miles of the location of said university, except for medicinal, mechanical, and sacramental purposes, under a penalty of \$25 for each offence, to be recovered before any justice of the peace of said county of Cook." The village therefore enjoys a high reputation for morality and sobriety. It was also declared that all property of the university should be exempt from taxation. Upon this point in 1873 commenced a bitter contest between the town and the management of the Northwestern University. After two unsuccessful appeals to the Supreme Court of the State a writ of error was taken to the U. S. Supreme Court. The decision of the lower court, which was unfavorable to the university, was reversed, and the property of the university was held to be exempt from taxation. By the charter the corporation is not allowed "to hold more than 2000 acres of land at any one time, unless the said corporation shall have received the same by gift, grant, or devise, and in such case it shall be required to sell or dispose of the same within ten years from the time they shall acquire such title, and on failure to do so such lands, over and above the before-named 2000 acres, shall revert to the original donor, grantor, deviser, or their heirs."

The land owned by the university was laid out for a village, with streets and house-lots; parks were reserved, lots were donated to churches, and Evanston soon became a popular place of residence. With the avails received from the sale of lots the debt of the university was paid, and a fund secured for the erection of University Hall. The university was opened to students in 1856. Dr. Hinman had died in June, 1855, and his successor, Rev. Randolph S. Foster, D. D., LL. D., was appointed president June 5, 1856. The other members of the faculty were Rev. Abel Stevens, LL. D., Henry S. Noyes, A. M., Rev. W. D. Godman, and Daniel Bonbright, LL. D. Literary, scientific, and elective courses, of four years each, were established. In the meantime a small wooden structure had been completed, and was occupied by the university. The building is still standing, having been removed from its original site, and with an addition is now occupied by the preparatory department of the university. The classes in the university were transferred to a large and commodious building of stone, costing \$110,000. About this time the university adopted as a part of its permanent policy a rule that one-fourth of all lands then held by it in the town of Evanston, and all owned in Chicago, should be reserved from sale and be leased, and the funds received from the remainder that should be sold should be converted into productive property and held as a permanent fund.

President Foster having resigned his office in 1860, Henry S. Noyes, A. M., professor of mathematics, became acting president of the university, holding the office for six years thereafter. Rev. Erastus O. Haven, D. D., LL. D., was elected president, and assumed

the duties of his office June 23, 1869. About this time important additions were made to the educational facilities of the university. The Chicago Medical College, which had been organized for ten years, became a department of the university, and during this year the university classes were opened for the admission of women. This movement was a preliminary step to the adoption, in 1873, of the Evanston College for ladies, as a part of the institution.

Dr. Haven having resigned his office, in October, 1872, Rev. Charles H. Fowler, D. D., LL. D., became its president. In June, 1873, the Union College of Law became a department of the university. At this time was created the College of Technology, or School of Applied Sciences, the students in which were given the use of the now extensive museum, drawing-room, and laboratories, in which to pursue their scientific studies and investigations. Photography and telegraphy were also taught, both in theory and practice. Subsequently, because of economical considerations, this department of the university was discontinued. Of the presidents named, Drs. Foster, Haven, and Fowler became bishops of the Methodist Episcopal Church. In 1876 Prof. Oliver Marey, LL. D., became acting president, and held this office till 1881, when Rev. Joseph Cummings, D. D., LL. D., the present incumbent, became president.

The university has been greatly prospered and its funds have been largely increased. The land purchased in Chicago for \$8000, from which an annual rental of \$8000 has been received since 1880, is now worth \$800,000. By the terms of the lease a new appraisal is to be made every ten years, and the next appraisal will be made in April, 1890. By the conditions of the lease the university will receive 7½ per cent. of the appraised value, and after the next appraisal its income will be very largely increased. The university still holds, for lease or for sale, lots in Evanston of the value of \$500,000. The property of the university is estimated to be worth about \$2,000,000. In all departments it has 100 professors and instructors, and more than 1300 students.

The following departments of the university are now organized: 1. The College of Liberal Arts, which has four regular courses of study, and opportunities for a select course. 2. The College of Medicine, Nathan S. Davis, M. D., LL. D., dean. 3. The College of Law, Henry Booth, LL. D., dean. 4. The College of Pharmacy, Oscar Oldberg, Ph. D., dean. 5. The College of Oral and Dental Surgery, John S. Marshall, M. D., dean. 6. The Dearborn Observatory, George W. Hough, director. 7. The Preparatory School, Rev. Herbert F. Fisk, D. D., principal. 8. The School of Elocution, Robert L. Cumnock, A. M., director. 9. The Conservatory of Music, Oren E. Locke, director. 10. Department of Art, Catharine Beal, B. P., director.

Located on the university grounds and closely connected with it are the Garrett Biblical Institute, Rev. Henry B. Ridgway, D. D., president; also the Swedish Theological Seminary, Rev. Albert Ericson, A. M., president; and the Danish and Norwegian Theological Seminary, Rev. N. E. Simonson, A. M., president. There is an interchange of privileges between the university and these theological schools, and each one derives all the advantages from the others that could be secured in any other relation that might exist.

The Woman's College is a large and elegant building that gives the young women the advantages of a well-regulated home. Miss Rena A. Michaels, Ph. D., is dean. There is also a college cottage, which offers special advantages to young women of limited means.

The colleges of medicine, of law, of pharmacy, and of dental and oral surgery are in Chicago, and the other departments are in Evanston.

The university has always maintained a preparatory school, graduating annually a class of 60 or more stu-

dents, with a faculty of 10 instructors. While it meets the requirements of the best colleges of the country, there is also provision for a general academic education for students who wish to prepare themselves for the study of medicine, law, teaching in the public schools, or for business.

A large and well-furnished Hall of Science, recently erected on the college campus, affords good accommodations for the departments of chemistry and physics. Practical instruction is given in the laboratories in this building in the departments of chemistry and physics.

The Dearborn Observatory, connected with the university, makes original researches in astronomical science, assists in the application of astronomy to geography, in communicating exact time, and furnishes instruction in astronomy to the students of the university. The principal instruments of the observatory are: 1. An equatorial refracting telescope, made by Alvan Clark & Sons, of Cambridge, Mass., in 1861. The instrument was the largest refractor in the world until a few years ago, and now has very few superiors. Diameter of object glass, 18½ inches. 2. A meridian circle, of the first class, constructed in 1867 by Messrs. A. Repsold & Sons, of Hamburg. This instrument has a telescope of 6 French inches aperture, and a divided circle of 40 inches diameter, read by 4 microscopes. Hough's printing and recording chronographs have been added, for making an electrical record of the time of star transits. (J. C.)

NORTON, ANDREWS (1786-1853). Unitarian minister, descended from the Puritan Rev. John Norton (q. v.), was born at Hingham, Mass., Dec. 31, 1786. He graduated at Harvard College in 1804, and was made tutor at Bowdoin College in 1809 and at Harvard in 1811. Becoming librarian in 1813 he succeeded Rev. Dr. W. E. Channing as lecturer on Biblical criticism and interpretation. In 1819 he was made Dexter professor of sacred literature, which position he resigned in 1830. He afterwards published *A Statement of Reasons for not believing the Doctrines of Trinitarians concerning the Nature of God and the Person of Christ* (1833). His important work on *The Genuineness of the Gospels* (4 vols., 1837-55), occupied most of the remainder of his life. He died at Newport, R. I., Sept. 18, 1853. He was one of the most learned Unitarians. He studied the New Testament with a critical yet reverent spirit, and opposed the extreme naturalistic interpretation. After his death his *Statement of Reasons* was republished with a memoir by Dr. W. Newell. Besides the works above mentioned he contributed important articles to the *North American Review* and other periodicals, and composed some hymns which have been widely used.

His son, CHARLES ELIOT NORTON, was born at Cambridge, Mass., Nov. 16, 1827. He graduated at Harvard College in 1846, and entered upon a mercantile life. He sailed to India in 1849 and returned by way of Europe. He afterwards made two other lengthy sojourns in Europe. He has published *Considerations of some Recent Social Theories* (1853); *Notes of Travel and Study in Italy* (1860); a translation of Dante's *Vita Nuova* (1867); and *Historical Studies of Church Building in the Middle Ages*. Besides editing his father's later works he was joint editor of the *North American Review* from 1864 to 1868, and contributed to the *Atlantic Monthly*.

NORTON, JOHN (1606-1663). Puritan divine, was born at Stortford, England, May 6, 1606. He was educated at Cambridge, was curate at Stortford, and became a Puritan. In 1635 he removed to Plymouth, Mass., where he preached during the winter and then became minister of the church at Ipswich. He took part in forming the Cambridge Platform in 1648, and in 1652 became associate minister of the church at Boston, where he was urgent in the persecution of the Quakers. After the restoration of Charles II. Norton was sent with Gov. Bradstreet to

London to assure the king of the loyalty of Massachusetts, but the result was not satisfactory to the people. Soon after his return Norton died at Boston, April 5, 1663. His most noted publication was *The Heart of New England rent by the Blasphemies of the Present Generation* (1659), a treatise against the Quakers. He also published a memoir of Rev. John Cotton (1658), and some theological treatises.

NORTON, WILLIAM EDWARD, painter, was born at Boston, June 28, 1843. He was apprenticed to a housepainter, but at the age of 18 went to sea, and after making several voyages began painting marine views in 1865. He went to Europe in 1877 and opened a studio in London. Among his works are *Whaleships Trying Out, Fog on the Grand Banks, Twilight on the Banks of Newfoundland, Nantasket Beach* in November.

NORWALK, a borough of Connecticut, and township of Fairfield co., is on Long Island Sound, 42 miles from New York city, on the New York, New Haven, and Boston Railroad, and is the terminus of the Danbury and Norwalk Railroad. It has a good harbor, 5 hotels, 5 national banks, 2 opera-houses, Masonic temple, 2 large boarding-schools, besides public schools, 10 churches, and 7 weekly newspapers. The oyster trade is extensive, and manufactures are largely carried on. Besides the largest straw-hat-factory in America, Norwalk has 7 fur-hat-factories and 3 shoe-factories. There are also 4 foundries, large iron-works, a lock-factory, several woollen- and grain-mills, and other manufacturing establishments. Norwalk was founded in 1649. Being ardently patriotic in the revolutionary war, it was burned by Gov. Tryon in 1779. In 1852 a terrible railroad accident was caused here by an open drawbridge. The township of Norwalk, about ten miles square, includes the city of South Norwalk as well as the borough of Norwalk. The latter has gas- and water-works and several parks. Many wealthy inhabitants of New York make this a summer residence, and during the winter flowers are sent in abundance to the metropolis. Population of Norwalk, 5308; South Norwalk, 3726; township, 13,956.

NORWALK, a village of Ohio, county-seat of Huron co., is on the Lake Shore and Michigan Southern Railroad, 56 miles W. S. W. of Cleveland. The Wheeling and Lake Erie Railroad also passes through the village. It is built on a sandy ridge and has well-paved, shady streets. There are 2 national banks, 14 churches, graded schools, railroad machine-shops, and manufactories of ploughs, organs, sewing-machines, shoes, tobacco, etc. The population in 1880 was 5704.

NORWICH, a city of Connecticut, the county-seat of New London co., is at the head of Thames River, 15 miles from Long Island Sound. It is on the Norwich and Worcester and the New London and Northern Railroads. It has several hotels, 6 national banks, 3 savings banks, 1 daily and 2 weekly newspapers, 24 churches, graded schools, and the Norwich Free Academy. The Thames River is formed by the confluence of three streams, which furnish abundant water-power. This has been utilized in large paper-, cotton-, and woollen-mills, and there are several foundries and works for making the machinery used in these. There are also manufactories of wood-type, files, locks, picture-cords, belts, and pistols. The city is lighted with gas and electricity, has water-works, 2 public squares, and street railways. The town was settled in 1659. In 1880 the population of the city was 15,112 and of the township 21,143.

NOTT, ABRAHAM (1767-1830), judge, was born at Saybrook, Conn., in 1767. He graduated at Yale College in 1787, and, after a brief study of theology, went to Georgia to teach school. He studied law at Camden, S. C., and was admitted to the bar in 1791. He served one term in Congress, 1799-1801, and in 1810 was elected a judge of the court of appeals. He died at Fairfield, S. C., June 19, 1830.

His son, HENRY JUNIUS NOTT (1797-1837), grad-

uated at South Carolina College in 1814, was admitted to the bar in 1818, and was professor of logic and philosophy in his *Alma Mater* for thirteen years. While returning from New York he was drowned off the coast of North Carolina, Oct. 13, 1837. He published *Noctettes of a Traveller* (2 vols., 1834).

Another son, JOSIAH CLARK NOTT (1804–1873), ethnologist, was born at Columbia, S. C., March 31, 1804. He graduated at South Carolina College in 1824, and obtained the degree of M. D. in Philadelphia in 1827. After acting as demonstrator of anatomy to Dr. Physick for two years, he began practice at Columbia, S. C. In 1835 he went to Europe, and after his return settled at Mobile. In 1857 he was made professor of anatomy in the University of Louisiana, and in 1858 established a medical college at Mobile which received an endowment from the State of Alabama. He died at Mobile, March 31, 1873. He published *Biblical and Physical History of Man* (1849); *Physical History of the Jewish Race* (1850); *Types of Mankind* (1854); and *Indigenous Races of the Earth* (1857), being assisted in the last two by G. R. Gliddon. He held the theory of a diverse origin of the several races of mankind and the inferiority of the negro.

Another son, GUSTAVUS ADOLPHUS NOTT (1810–1875), became professor of anatomy in the University of Louisiana in 1839, and materia medica and therapeutics in 1848. He was a surgeon in the Confederate army. He died at Montgomery, Ala., June 6, 1875.

NOTT, ELIPHALET (1773–1866), president of Union College, was born at Ashford, Conn., June 25, 1773. He graduated at Brown University in 1795 and became pastor of a Presbyterian church and principal of an academy at Cherry Valley, N. Y. In 1798 he removed to Albany, where he acquired celebrity as a pulpit orator. His sermon on the death of Alexander Hamilton is one of the most famous specimens of American pulpit eloquence. In 1804 he was elected president of Union College, Schenectady, N. Y., which was then a feeble institution with only 14 students; but under his judicious management it increased steadily in numbers and usefulness. In 1854 the semi-centennial anniversary of his inauguration was celebrated with great enthusiasm by over 600 graduates. Altogether more than 3700 students graduated in his presidency. Towards the end of his life he was relieved to some extent of the duties of his office. He had also been prominent in church affairs, and in 1811 was moderator of the Presbyterian General Assembly. Besides taking much interest in natural science he made several useful inventions. His noteworthy improvements in stoves caused them to be generally used instead of open hearths for heating dwellings. Philanthropic movements, and especially the temperance cause, enlisted his services. After a long life spent in active beneficence, he died at Schenectady, N. Y., Jan. 29, 1866. Among his publications are *Counsels to Young Men* (1810); *Lectures on Temperance* (1847); *Resurrection of Christ* (1872). His *Memoirs* were published by H. Van Santvoord (1876).

His brother, SAMUEL NOTT, D. D. (1754–1852), was born at Saybrook, Conn., Jan. 23, 1754. He graduated at Yale College in 1780 and became pastor of the Congregational church at Fairfield, Conn., in 1782. Here he labored for seventy years, until his death, May 26, 1852.

SAMUEL NOTT (1788–1869), son of the preceding, graduated at Union College in 1808 and at Andover Theological Seminary in 1810. Being ordained Feb. 6, 1812, he was sent as missionary to India by the American Board of Commissioners of Foreign Missions. On account of ill health he returned in 1816, and taught in New York until 1822. He afterwards held pastorates at Galway, N. Y., and Wareham, Mass. At the latter in 1849 he founded an academy which he conducted until 1858. He died at Hartford, Conn., June 1, 1869. He published *Slavery and the Remedy* (1856).

NOYES, GEORGE RAPALL (1798–1868), Biblical scholar, was born at Newburyport, Mass., March 6, 1798. He graduated at Harvard College in 1818 and studied theology at Cambridge Divinity-School. He was licensed to preach in 1822 and held pastorates at Brookfield and at Petersham, Mass. In 1840 he was made professor of Hebrew and Oriental languages and Dexter lecturer on Biblical literature. Besides many reviews and sermons he published new translations, with notes, of several books of the Old Testament. After his death his translation of the New Testament from Tischendorf's text was edited by Dr. Ezra Abbot (1868). He died at Cambridge, Mass., June 3, 1868.

NOYES, JOHN HUMPHREY (1811–1886), communist, was born at Brattleboro, Vt., Sept. 3, 1811. He graduated at Dartmouth College in 1830, studied theology at Andover and New Haven, and was licensed to preach in 1833. A year later he began to advocate "perfectionism," and his license was revoked. In 1838 he established a communistic society at Putney, Vt., and in 1847 removed it to Madison co., N. Y., where it was called the Oneida Community, for which see *ENCYCLOPEDIA BRITANNICA*. A second community was established at Wallingford, Conn. In 1882 the people of Oneida county became thoroughly roused against the immoral practices prevailing in the Community and obtained power from the Legislature to stop them. The members then renounced their obnoxious practices and formed a business corporation. Noyes published some periodicals, of which the *Oneida Circular* was the chief. He also published *The Berean, Salvation from Sin, Bible Communism, History of American Socialisms*. He died at Niagara Falls, Canada, April 13, 1886.

NUBAR PASHA, an Egyptian statesman, was born at Smyrna in January, 1825, of an Armenian Christian family. He was early taken to Europe and educated in Switzerland and France. In 1842 he went to Egypt to become secretary of Bogos-Bey, a relative, who was then minister of foreign affairs. Two years later he became secretary-interpreter to Mehemet Ali and afterwards to Ibrahim Pasha. His influence steadily increased, and Abbas Pasha, in 1850, sent him to London to support the claims of Egypt against Turkey, and also on other diplomatic missions. Under Said Pasha (1854–63), though not always in favor, he was able to construct the railroad from Suez to Cairo, in spite of great natural and financial difficulties. Ismail Pasha employed Nubar as his agent with the Sultan, and thus obtained various important concessions. His next negotiations were at Paris with reference to the Suez Canal, and on his return to Egypt he was made minister of the public works. Towards the end of 1866 he was made minister of foreign affairs, and, having gone to Constantinople, he obtained from the Sultan for his master the title of Khedive, while Egypt was made practically independent. Nubar Pasha's efforts were then directed to introducing European customs into the administration of affairs. He was driven from power in May, 1874, but was restored a year later. Again removed early in 1876, he did not return until England and France had intervened and required a complete reconstruction of the financial affairs in favor of the bondholders of Western Europe. Nubar Pasha became president of the cabinet Aug. 23, 1878, but the discontent of the native Egyptians with the new methods of taxation and administration obliged him to resign six months later and even to leave the country for a time. During the revolt of ARABI PASHA (q. v.) and the English intervention, Nubar Pasha remained quiet. At last, on Jan. 8, 1884, he was called again to the head of affairs, and his administration has been favorable to the interests of the British government, and yet more acceptable to the Egyptians than formerly.

NUISANCE. American law has closely followed the English in defining this term and prescribing the

remedy. It may be added here that the locality has much to do with the question what constitutes a nuisance. People living in populous manufacturing towns must expect more noise, smoke, and disturbance than those living elsewhere; consequently a manufactory which might be a nuisance if situated entirely among residences would not necessarily be so in such a town. The following are some instances of public nuisances: The bathing in a public river in sight of the neighboring houses; rude or riotous games or sports, involving a breach of the peace; the keeping of a disorderly or gaming house; keeping a dangerous animal, known to be such, and suffering him to go at large; exposing a person having a contagious disease in public; the bringing a horse infected with glanders into a public place; the selling tainted or unwholesome food; the leaving a corpse unburied; the storing of combustible articles in undue quantities or in improper places. Private nuisances may be either to corporeal hereditaments, *e. g.*, the building of a house so as to throw the rain-water on the adjoining tenement; or to incorporeal hereditaments, *e. g.*, obstructing a right of way, interfering with a franchise, etc.

Annoyances from odors, smoke, unhealthy exhalations, noise, etc., are in the nature of private nuisances and will be restrained by injunction at the instance of the person injured. An action for damages will also lie in such cases. (T. R.)

NULLIFICATION. This term, as used in the history of the United States, refers to the public acts of South Carolina, declaring certain acts of Congress to be in excess of the constitutional authority of that body, and therefore void of efficacy, and commanding her citizens to refrain from yielding obedience to them.

On May 19, 1828, an act of Congress was passed imposing duties upon certain commodities imported into the United States from foreign countries. Acts of a similar character, previously passed by Congress, to meet certain exigencies, financial and commercial, had not encountered resistance in any of the States. During the discussion of this act it was characterized in several of the States, notably in South Carolina, as intended distinctly for the protection of domestic manufactures. The Legislature of South Carolina had in 1825 declared "that it is an unconstitutional exercise of power on the part of Congress to lay duties to protect domestic manufactures."

The discussions attending the action of the Legislature just referred to disclose the origin of the opposition to protective legislation, in part, in its inconsistency with the views of the national Constitution that prevailed in that State, as in others of the Southern group, and, in part, in the nature and condition of the productive industry of that section, that was then regarded as excluding the development of manufactures. The production to which South Carolina looked as the basis of her economic system and to which her institutions and laws were conformed was that of cotton, the staple of the largest existing manufactures, for which the principal markets were European, and the necessities of cotton-planting appeared to those engaged in it to demand the perpetuation of legal slavery as the only form in which labor could be applied to that industry under existing climatic conditions. The cotton-planting interest considered that the industrial development of the respective groups of States, Northern and Southern, must disclose divergences of interest and policy, widening with the growth of the country, that could not be harmonized under a government unitizing these groups. Viewed from the same standpoint it seemed a necessity, not only that the domestic institutions of the cotton-producing States should be entirely free from the influence of other communities differently situated, but that the commercial intercourse between the great staple producer and the best markets of the world

should be free from conflicting interests. These prudential considerations were fully recognized in the Legislature of South Carolina and indicate the state of interests that formulated a political policy tending to deny to the government of the United States a national character and to subject it to a controlling power held in reserve not only by groups of States united in interest, but by individual States, to be exercised as their views of their own interest might suggest. The policy that thus connected itself with the cotton interest had preceded the development of that industry, having relation to other staples produced in the Southern section of the Union, and was brought into a distinct statement by the Kentucky and Virginia Resolutions of 1798 and 1799. This doctrine, as advanced by those resolutions and subsequently applied in the attempt of South Carolina to nullify the revenue laws of the United States, is considered in another place under STATES RIGHTS.

As stated in the legislative records of South Carolina, discussing the right to nullify the action of Congress, that doctrine involves several distinct propositions which will be briefly noted. The Constitution was regarded as a compact between sovereign States, and not as an organic act of the peoples of the States uniting in the Constitution of a government of the whole; certain agencies were thereby created as the common agencies of the sovereign parties to the compact, and the powers and duties of such agencies specifically defined, so as to exclude any enlargement thereof by implication, such as could be made if the fundamental intention was the production of a sovereign government; the allegiance of the citizens of the States was regarded as wholly due to their respective State governments, and capable of being claimed by the general government only through the assent of such States; the legislative, executive, and judicial departments of the government of the United States were regarded as functions depending upon the assent of the sovereign States, and could not be exercised to control the source from which their authority was derived; that any State could, consistently with the compact, retire from it whenever, in its judgment, the powers conferred were abusively exercised to the prejudice of its honor or its interests.

From the premises just stated it was concluded that as the power to promote manufactures by means of imposts on foreign goods was not among the enumerated powers specifically conferred upon Congress, it was not capable of being exercised, and the attempt to exercise it on the part of Congress was an assumption of powers that belonged to the States, and accordingly that it was competent for any one of the States to refuse to allow the execution of such laws within its territories, or, if that course was deemed desirable, to retire from the union of the States.

On Dec. 19, 1827, the Legislature of South Carolina reiterated the declaration of 1825, as above stated. This action was upon an elaborate report of a Senate committee declaring that such usurpation of authority by Congress must be resisted by the States in their sovereign character, and was not proper for submission to the judiciary of the United States.

After the passage of the act of 1828, and on Dec. 19 of that year, the Legislature of that State protested against the act on the broad ground before affirmed, and already stated, and directed such resolutions to be communicated to the governors of the respective States, to be laid before their respective Legislatures, to determine on such ulterior measures as they may think the occasion demands. Such communication took place and was responded to by Virginia and Georgia in terms approving the general views of South Carolina as to the limitations of the authority of Congress, but indicating unwillingness to sanction the attitude of hostility assumed by South Carolina towards the United States.

On Dec. 17, 1830, the Legislature of South Carolina

declared that the several acts of Congress imposing duties upon imports for the protection of domestic manufactures are deliberate and highly dangerous and oppressive violations of the Constitution, and that it is the right of any State suffering thereby, after all hope of redress is lost, to interpose in its sovereign capacity for the purpose of arresting the progress of the evils occasioned by such unconstitutional acts.

On June 14, 1832, Pres. Jackson sent a letter to citizens of Charleston, by whom he had been invited to unite with them in commemorating independence on the ensuing 4th of July. This letter was mild and conciliatory in its general tone, but contained the following sentence, that was the only expression contained in it that indicated the intended attitude of the administration. He says, speaking of the circumstances that should be weighed in the existing state of affairs: "But he should also see that high and sacred duties, which must and will at all hazards be performed, present an insuperable barrier to the success of any plan of disorganization, by whatever patriotic name it may be decorated, or whatever high feelings may be arrayed in support of it." On Dec. 17, 1831, the Legislature of South Carolina declared that the letter of Pres. Jackson was to be regarded as an official utterance, and, as such, "is an unauthorized interference in the affairs of this State; that the principles advanced in it are incompatible with the Constitution, and subversive of the rights of the State; that the threatened course of executive conduct would, if acted upon, destroy the liberties of the country, and as a threat is a dangerous precedent, highly repulsive to the feelings of a free people." The report on which this action was based distinctly assumes the ground that a State has the right to withdraw from the Union, and is the sole judge of the sufficiency of the ground for so doing, this right being stated as inherent in the compact of the States.

Congress, in 1832, repealed the act of 1828 and re-adjusted a tariff of duties, to take effect from March 3, 1833.

On Oct. 26, 1832, the Legislature of South Carolina called a convention of the State to take into consideration the acts of Congress imposing duties on foreign imports for the protection of domestic manufactures, to determine their character and means of redress; also any amendment of, or substitute for, such acts that Congress may enact; also all laws for executing and enforcing the same.

The convention met, and on Nov. 24, 1832, adopted an ordinance "to nullify certain acts of the Congress of the United States purporting to be laws laying duties and imposts on the importation of foreign commodities." After reciting that the object of these laws was for the protection of domestic manufactures, and characterizing them as oppressive and unconstitutional, it declares that the acts of 1828 and 1832 are unauthorized by the Constitution and are null and void, with all obligations, acts, and judicial proceedings intended for their enforcement. It declares unlawful any attempt to enforce the collection of such duties by any officer of the State or of the United States, and enjoins upon the Legislature the passage of acts to enforce this ordinance. It declares that there shall be no appeal from any judgment denying the validity of such acts of Congress, and that no record in any such case shall be transmitted to the appellate court, but the courts of the State shall proceed to execute any such judgment notwithstanding any such appeals, and the taking of such an appeal shall be regarded as a contempt of the court. It further requires an oath to support this ordinance to be taken by all public officers and jurors. Finally, it declares that if any attempt should be made by the federal government to coerce the State, they will hold themselves absolved from all further obligations to maintain or preserve their political connection with the people of the other States, but will organize a separate government. Upon the adop-

tion of this ordinance the convention issued an address to the several States of the Union setting forth its action and the grounds on which it was based.

On Dec. 10, 1832, Pres. Jackson issued a proclamation reciting the ordinance of South Carolina and the grounds on which it was placed, and characterizing it as an act of nullification and secession, and declared it unconstitutional. He states that as the opposition to the laws had clothed itself with State authority, an exposition of the views of the administration was appropriate. He holds that the only appeals from the action of Congress, recognized by the Constitution, are to the judiciary, the people, and the States, and that as the Constitution is the supreme law of the land no State can annul a law. He claims that the declaration that the law was intended for the protection of domestic manufactures, and therefore was unconstitutional, goes to the motives that prompted the law and not to the authority by which it was passed, and is a dangerous construction. He holds that the government of the United States is a national government, and not merely a league; that to the extent of the grant of power to Congress the States parted with their sovereignty, and the allegiance of their citizens was, to that extent, transferred to the national government. He exhorts the people of South Carolina to yield obedience to the law, and finally declares his determination "to execute the laws, to preserve the Union by all constitutional means, to arrest, if possible, by moderate and firm measures, the necessity of a resort to force." He says that he would not unnecessarily cause the shedding of blood. This masterly document, issued in the name and by the authority of the President, was prepared by his secretary of state, Edward Livingston.

On Dec. 17, 1832, the Legislature of South Carolina directed the governor, in view of the President's proclamation, to issue his proclamation to the people of the State, warning them against the "attempt of the President of the United States to seduce them from their allegiance," and exhorting them "to disregard his vain menaces," and calls upon them to protect the liberty of the State. This proclamation was issued Dec. 21, 1832. On Dec. 20, 1832, an act was passed to carry into effect the ordinance, providing judicial remedies for the recovery of goods seized or held for the payment of duties imposed by the act of Congress, and on the same day one was passed regulating the taking of the oath called for by the ordinance.

Virginia responded to the address of the convention of South Carolina, communicating her views through a commissioner sent to that State. Virginia, while holding to the general doctrines propounded and acted upon by South Carolina, did not approve of the adoption of the ordinance, and advised its repeal.

On March 2, 1833, Congress amended the act of 1832, by the Compromise act, the main feature of which was the reduction of the duties imposed by that act where such duties were in excess of 20 per cent. *ad valorem*, to that amount, by a gradual process, that should not be complete until the year 1842. This act was followed on the next day by the Force act, by which the President was authorized to remove any custom-houses, where obstruction existed to the enforcement of the revenue laws, to some convenient place where the collector must remain, and to use the military force to secure the collection of duties at such place. This act also increased the judicial authority of the courts of the United States in revenue cases.

On March 15, 1833, the convention, which had been reconvened, passed an ordinance reciting the act of March 2, 1833, and repealing the ordinance of nullification and secession, and on March 18 adopted an ordinance declaring null the act of Congress known as the Force act, which last measure was followed by an act of the Legislature to carry into effect such annulling ordinance. The repeal of the ordinance of nullification, aimed at the acts imposing duties, left those acts

free to be enforced within that State, and, accordingly, the Force act not being called into operation, the ordinance nullifying it was inoperative, and appears to have received no attention from the national government.

See *Statutes at Large of South Carolina*, vol. i., Appendix; *Elliot's Debates on Federal Constitution*, vol. iv.; Dr. C. J. Stillé on "J. R. Poinsett" in *Penna. Magazine of History* (1888), and STATES RIGHTS.

NUMISMATICS, AMERICAN. Only the coins of the United States and its pre-existing colonies will be noticed here. The early settlers of New England found the

Indians using *wampum*, or strings of beads made from shells, as a currency, and for other purposes. The General Court of Massachusetts soon recognized this money and fixed an arbitrary rate of exchange. At first six white beads, made from the sea-conch, or three purple, made from the muscle-shell, were taken as equivalent to an English penny. In a few years four white and two purple were declared to have that value. Musket balls and other articles were made legal tender for small amounts and furs and peltry for large sums. The coins brought from England or received in trade from the Dutch and the West Indies tended to flow back to Europe, and what remained in the country were insufficient for the needs of the colonists. On May 27, 1652, therefore, the General Court of Massachusetts ordered a mint to be established in Boston, and John Hull, mint-master, struck silver shillings, sixpences, and threepences. They bore the device of the pine-tree, and were of the same fineness but less in weight than the English coin of the same denomination. For thirty-six years this mint continued in operation in spite of opposition from the mother country. An attempt was made to conciliate King Charles II. by substituting the Royal Oak for the Pine-tree. Other changes were made in the device, but no alteration in the date, which remained always 1652, but two-penny pieces were coined with the date 1662. No other colony had a mint, but in 1659 Lord Baltimore caused shillings, sixpences, and groats to be coined for use in Maryland. James II. issued tin coins for circulation in America, though few seem to have found their way thither. In 1722, 1723, and 1733 copper coins were minted in England with the legend "Rosa Americana." There were also copper half-pence issued in 1773 for circulation in Virginia, and in 1774 silver shillings. Florida and Louisiana had also some colonial coins before they became part of the United States.

When the independence of the American colonies was declared the feeling of the people was manifested in the issue of coins or tokens with patriotic inscriptions. The coins sometimes were authorized by the States, sometimes emitted by traders, or even prepared in England and Germany and sent here as a speculation. Massachusetts in 1787 ventured again to establish a mint, which issued only cents. The other colonies which had a coinage were Connecticut, Vermont, New York, New Jersey, Maryland, and Kentucky. The Continental Congress on Oct. 16, 1786, passed an act for the establishing of a mint, and regulating the value and alloy of the national coin. In July, 1787, the government prescribed the device for copper coin, and under this authority the so-called "Franklin Penny" with the legend "Mind Your Business" was made by contract. The Federal Constitution, ratified in 1789, deprived the States of their former right of coining money. After the Federal government was organized under this Constitution the Mint was established at Philadelphia in 1792 (see MINT) and the regular coinage began in the next year. Copper cents and half-cents, bearing an ideal head, with loose-flowing hair, were first issued. "Washington cents," however, had been prepared as

pattern-pieces in 1791, but, being disapproved by Washington himself, did not become current. In the article on MINT are given the dates of the authorization of the various coins with their respective weights and fineness. The devices have been changed at various times.

Down till about 1837 the obverse had generally a female head, sometimes with a liberty-cap, and sometimes with a fillet bearing the word "Liberty." Afterwards was substituted a full-length seated figure with a liberty-cap on a pole and a shield with a band inscribed "Liberty." The reverse on the principal coins has the eagle, often with a shield, arrows, and olive branch, but in the minor coins the denomination of the piece encircled by a wreath. The coins issued at the branch mints at Charlotte (1830-61), Dahlonega (1838-61), New Orleans (1826-61), San Francisco (1854), and Carson City (1870) are distinguished by the initials C., D., O., S., and C. C., on the reverse.

At the establishment of the mint eagles, or ten-dollar pieces, were the highest denomination authorized. Their coinage was discontinued in 1804 and resumed in 1838 after the gold mines of the Carolinas and Georgia began to furnish a larger supply of the precious metal. The discovery of gold in still greater abundance in California caused demand for a larger coin, and the double-eagle was issued in 1850. Ingots and bars of various sizes were issued by the assayer of the State of California, and after a time a fifty-dollar piece was issued by the U. S. Assay Office in San Francisco. The same excess of gold, which required these larger denominations, called into existence also gold dollars, which were authorized in 1849. Besides the governmental issues there were octagonal and ring dollars and gold half-dollars and quarters put in circulation in California. The Mormons in Utah also had a series of gold coins with peculiar devices, and their favorite inscription, "Holiness to the Lord." The Constitution of the United States prohibited coining by the States, and it has been held that individuals may issue coins which are not similar to the national coinage. Such coins had been issued by Reed in Georgia in 1830, and by the Bechtlers in North Carolina from 1831 for several years.

As works of art the coins of the United States are little esteemed. The finest was the three-dollar piece of 1854, which was soon withdrawn as too close in value to the quarter-eagle. The rarest gold coins of the United States are: Eagles, 1798, 1838; Half-eagles, 1797, 1815, 1822, 1824, 1828; Quarter-eagles, 1796, 1797, 1798, 1806. The Double-eagle of 1849 in the U. S. Mint is the only one in existence. The rarest silver coin is the Half-dime of 1802. Of several coins of rather early date none are known to collectors although their coinage is reported by the Mint. In 1815 no cents were coined, this being the only year in which that coin was not issued. See M. W. Dickenson's *American Numismatological Manual* (Phila., 1859); and Henry Phillips, Jr.'s, *Coins of the United States* (Phila., 1881).

NUTTALL, THOMAS (1786-1859), naturalist, was born in Yorkshire, England, in 1786. By trade a printer, he came to the United States, travelled extensively in the Mississippi Valley, exploring both the Missouri and the Arkansas Rivers, and also visited the Pacific coast. Part of his observations appeared in *A Journal of Travels into the Arkansas Territory* (1821). He also published a *Manual of the Ornithology of the United States and Canada* (1834), and in his *North American Sylva* (1817) translated Michaux's work, which he subsequently enlarged (3 vols., 1842-49). From 1822 to 1834 he was professor of natural history in Harvard College, but having inherited an estate in England, returned to that country and died there, Sept. 10, 1859. See BOTANY.

O.

OAK. The highly valuable genus of trees known as *Quercus*, or the oak, is found over nearly all the northern hemisphere, except the extreme north, embracing both deciduous and evergreen species.

The oaks naturally separate into two divisions: the annual-fruited, in which the acorns mature in the autumn of the first year, and the kernel has commonly a sweet taste; and the biennial-fruited, in which the acorns do not mature till the autumn of the second year, and the kernel is always bitter. To the annual-fruited division belongs the group of white oaks, including *Quercus alba*, or the white oak, a large tree with whitish bark and edible seed; *Q. obtusiloba*, the post oak; *Q. macrocarpa*, the burr or over-cup oak; and *Q. lyrata*, the southern over-cup oak. To the same division belong the chestnut oaks, including *Q. bicolor*, the swamp white oak; *Q. prinus*, the chestnut oak; *Q. prinoides*, the dwarf chestnut or chinquapin

The white oak gives hard and durable timber, and its bark is used for tanning. The live oak yields a yellow, close-grained timber, which is of unequalled excellence as ship timber, and is highly prized everywhere. Its low habit of branching also enables it to furnish an abundance of excellent ship-knees. The black oak (*Q. tinctoria*) yields a timber second only to that of the white oak in value, while its bark contains much tannin and an abundance of coloring matter, and is much used in tanning and dyeing. Other oaks of commercial utility might be cited, but the above named are the most valuable. (C. M.)

OAKLAND, a beautiful city of California, the county-seat of Alameda co., is on the E. shore of San Francisco Bay, 4½ miles from San Francisco. It is the terminus of the Central Pacific and Southern Pacific Railroads. Two narrow-gauge railroads, the South Pacific Coast and the California and Nevada, also terminate here, and there are two local steam railroads and ferries to San Francisco. Across Oakland estuary there are two railroad draw-bridges and one for general use. The city contains a court-house, hall of records, city-hall, one national and 2 other banks, 3 daily and 6 weekly newspapers, 30 churches, 25 schools, and the State Home for the Adult Blind. It has several foundries, canning-factories, and cotton-, jute-, woollen-, iron-, and nail-mills, and manufactures of shoes, leather, pottery, carriages, agricultural implements, etc. The city is on a plateau shut in by hills and the bay, the wide streets are macadamized and trees and flowers are seen on all sides. The property of the city is valued at \$30,000,000. It has gas- and water-works and other public conveniences. It was settled in 1850 and incorporated in 1852, but only fairly began to grow in 1868, when the Central Pacific Railroad established the ferry and local railroad. No charge is made on these roads for riding within the city limits. In the centre of the city is a salt water reservoir used for flushing the sewers. In 1880 the population was 34,554.

OATS. See under AGRICULTURE, chap. v. 1.

OBSERVATORIES IN THE UNITED STATES.

The honor of founding the first astronomical observatory in America has been claimed for the University of North Carolina. In 1824 Dr. Joseph Caldwell, the president of that university, purchased in London a meridian transit instrument and a zenith telescope by Simms, a refractor by Dollond, an astronomical clock by Molyneux, a sextant by Wilkinson, a reflecting circle by Harris, and a Hadley's quadrant, and these instruments were used in the university-building till 1831, when they were placed in an "observatory" especially designed for their reception. Observations were made at this place by Dr. Caldwell, Prof. Elisha Mitchell, and Prof. James Phillips, but the records have been lost. The instruments were removed in 1835, and in 1838 the building was partially destroyed by fire, and astronomical activity was never renewed. The Hopkins Observatory of Williams College, erected in 1836, is the oldest observatory that has continued its activity to the present time, while the observatory of the Western Reserve College, Hudson, Ohio (1838), and the High School Observatory at Philadelphia (1838-1840), which became famous under Walker and Kendall, deserve especial mention in the early history of practical astronomy in this country. These were followed by the Cincinnati Observatory, in 1842, the United States Naval Observatory at Washington, in 1844, and the Harvard Observatory at Cambridge, erected about the same time. In later years we have the Washburn Observatory (1880), the McCormick Observatory (1884), and finally the Lick Observatory, with its magnificent equipment, finished in 1888.

Live Oak Grove, Bonaventure, Savannah, Ga.

oak; and the live oak, *Q. virens*, a tree of the barrens from Virginia south, whose wood is very firm and durable, and of the greatest value commercially.

The biennial-fruited oaks include, *Q. cinerea*, the upland willow oak; *Q. Phellos*, the willow oak; *Q. imbricata*, the laurel or shingle oak; *Q. aquatica*, the water oak; *Q. nigra*, the black-jack or barren oak; *Q. ilicifolia*, the black scrub oak; *Q. fulcata*, the Spanish oak; *Q. Catesbei*, the barren scrub oak; *Q. coccinea*, the scarlet oak, with variety *Q. tinctoria*, the black oak; *Q. rubra*, the red oak; and *Q. palustris*, the swamp or pin oak.

In the Pacific States there are several species of the white oak group, including *Q. Garryana*, whose wood is equal to that of the white oak for ship-building; *Q. lobata*; and *Q. Douglasii*. The chestnut oak of California, *Q. densiflora*, is an evergreen; as also is *Q. chrysolepis* and *Q. agrifolia*. The last two of these species are shrubs or trees of 30 to 40 feet high, according as they grow on the mountains or the foot-hills. There are other species of North American oaks, most of them of no economical importance, though *Q. Michauxii*, the basket or cow oak, yields timber that is excellent for wheel stocks, baskets, etc., while its large sweet acorns are eagerly eaten by cattle and other animals.

The following list contains a brief description of the most important observatories in the United States. The longitude, when obtainable, is referred to the meridian of Greenwich.

Akron, Ohio, Buchtel College Observatory, lat. $+41^{\circ} 3'$, long. $5^{\text{h}} 26^{\text{m}}$ W. Built in 1885-86; $4\frac{1}{2}$ -in. equatorial by Pike & Sons; 3-in. transit circle, with zenith telescope attachment, by Fauth; sidereal and mean time clocks, chronograph, and apparatus for dropping a time-ball and correcting a system of controlled clocks. The observatory is intended for the instruction of students and the maintenance of a time-service. Cost, about \$5000. Director, C. S. Howe.

Albany, N. Y., Dudley Observatory, lat. $+42^{\circ} 39' 49''.5$, long. $4^{\text{h}} 54^{\text{m}} 59''.2$ W. Founded by subscription in 1851; inaugurated 1856; became a department of Union University in 1873. The instruments are: a 13-in. Fitz equatorial, 8-in. Pistor & Martins meridian circle, 6.4-in. transit instrument by the same makers, 4-in. comet-seeker, clocks, chronographs, and subsidiary apparatus. With the meridian circle the *Astronomische Gesellschaft* zone, from $+1^{\circ}$ to $+5^{\circ}$ declination, has been observed by Prof. Boss. Time-signals are supplied to the city of Albany. Directors: B. A. Gould, 1854; O. M. Mitchel, 1859; G. W. Hough, 1862; Lewis Boss, 1875.

Allegheny, Pa., Observatory of the Western University of Pennsylvania, lat. $+40^{\circ} 27' 41''.6$, long. $5^{\text{h}} 20^{\text{m}} 2''.9$. 13-in. Fitz equatorial, reworked by Clark, 4-in. Troughton & Simms transit, spectroscopes, photometers, bolometer. Prof. S. P. Langley, the director, has made important investigations in solar physics at this observatory, and has also, since 1869, maintained a very efficient time-service over the Pennsylvania Railroad system.

Amherst, Mass., Lawrence Observatory of Amherst College, lat. $+42^{\circ} 22' 15''.6$, long. $4^{\text{h}} 50^{\text{m}} 7''.3$ W. Erected in 1847; $7\frac{1}{2}$ -in. equatorial by Clark; $6\frac{1}{2}$ -in. transit instrument by Pistor & Martins, rebuilt by Fauth; 3-in. transit circle by Gambey; clocks, chronograph, and smaller instruments. The observatory is chiefly for instruction. Director, D. P. Todd.

Annapolis, Md., lat. $+38^{\circ} 58' 53''.5$, long. $5^{\text{h}} 5^{\text{m}} 56''.5$ W. U. S. Naval Academy Observatory, used for instruction only; $7\frac{1}{2}$ -in. equatorial, made by Clark in 1857, 4-in. Repsold meridian circle, small transit and zenith telescope, both by Würdemann, a combined transit and zenith telescope of the Russian pattern by Stackpole, clock, chronometers, chronographs, etc. The department of astronomy was created in 1853, and until 1859 was under the charge of Prof. William Chauvenet.

Ann Arbor, Mich., lat. $+42^{\circ} 16' 48''.0$, long. $5^{\text{h}} 34^{\text{m}} 55''.2$ W. Erected in 1853-54 by the citizens of Detroit, and hence known as the Detroit Observatory; it forms a department of the University of Michigan. The instruments are: a 13-in. Fitz equatorial, a $6\frac{1}{2}$ -in. Pistor & Martins transit circle, clocks, and chronograph. A students' observatory contains a 6-in. equatorial and 3-in. transit, with zenith telescope attachment. The observatory-plant is valued at about \$40,000. Directors: F. Briinnow, 1854; J. C. Watson, 1858; M. W. Harrington, 1879. Watson discovered 21 asteroids here.

Baltimore, Md., Denmore Observatory, private observatory of Mr. W. H. Nunsen, lat. $+39^{\circ} 21'$, long. $5^{\text{h}} 6^{\text{m}} 52^{\text{s}}$ W.; 4-in. Cooke equatorial.

Beloit, Wis., Smith Observatory. 9.5-in. equatorial, objective by Clark, mounting by Warner & Swasey. Directors: John Tatlock, Jr., 1884; C. A. Bacon, 1886.

Berkeley, Cal., students' observatory of the University of California. 6-in. Fauth equatorial, with spectroscope and other attachments, 3-in. combined transit and zenith telescope of the "Davidson pattern" made by Fauth, clock, chronometer, chronograph, and other accessories for instruction of engineering students, or

original work by students of astronomy. Director, Frank Soulé.

Bethlehem, Pa., Sayre Observatory of Lehigh University, lat. $+40^{\circ} 36' 23''.9$ long. $5^{\text{h}} 1^{\text{m}} 31''.9$ W. Founded in 1877; 6-in. Clark equatorial, Stackpole transit and zenith telescope. Director, C. L. Doolittle.

Boston, Mass., private observatory of Mr. C. L. Woodside (1886); lat. $+42^{\circ} 22' 39''.7$, long. $4^{\text{h}} 44^{\text{m}} 9^{\text{s}}$ W.; $6\frac{1}{2}$ -inch silvered glass reflector.

Brooklyn, N. Y., private observatory of H. M. Parkhurst; lat. $+40^{\circ} 41' 2''$, long. $4^{\text{h}} 55^{\text{m}} 50^{\text{s}}$ W. Built in 1862; rebuilt in 1877; a 9-in. Fitz equatorial has been used principally in photometric observations.

Cambridge, Mass., Observatory of Harvard College; lat. $+42^{\circ} 22' 48''.3$, long. $4^{\text{h}} 44^{\text{m}} 31''.0$ W. Founded in 1843. As early as 1815 an observatory was projected, and in 1827 the Dana house was purchased to serve at least as a temporary astronomical establishment. In 1839 Mr. W. C. Bond was appointed "astronomical observer for the college" and carried on a series of observations in co-operation with the Wilkes expedition till 1842. The provisional observatory at the Dana house contained a Troughton & Simms transit of $2\frac{1}{2}$ -in. aperture, a Short telescope of 5-ft. focus, and magnetical and meteorological instruments. In 1841 the present site of the observatory, then known as Summer House Hill, was purchased. In 1843, under the enthusiasm aroused by the sudden appearance of the great comet of that year, the sum of \$25,730 was subscribed for the purpose of erecting an observatory and providing it with a telescope of the largest size. The buildings were finished in 1844. The 15-in. refractor (costing \$19,842), by Merz & Mahler, of Munich, was mounted in 1847. With this instrument G. P. Bond discovered the seventh satellite of Saturn, Hyperion, in 1848, and the inner or dusky ring of Saturn in 1850. The observatory possessed also two 4-in. comet-seekers, and a $4\frac{1}{2}$ -in. equatorial, which was replaced, however, in 1869, by one of $5\frac{1}{2}$ in. made by Clark. A chronograph or spring-governor, the invention of W. C. Bond, was first brought into use here in 1849. A Troughton & Simms meridian circle of 84-in. aperture, embodying several new features suggested by Prof. Winlock, and a $2\frac{1}{2}$ -in. "Russian" transit were mounted in 1870. With the former instrument the *Astronomische Gesellschaft* zone, $+50^{\circ}$ to $+55^{\circ}$, was observed by Prof. W. A. Rogers. A horizontal photoheliograph of 40-ft. focus, devised by Prof. Winlock, was successfully used in photographing the sun in 1870. Prof. Pickering added several photometers of his own invention to the equipment, the most important being a large meridian photometer constructed in 1883. Since 1885 much attention has been given to astronomical photography. Mrs. Henry Draper has lent to the observatory the principal instruments of Dr. Draper's observatory at Hastings, an 11-in. Clark equatorial and 15-in. and 28-in. reflectors, and has furnished means for carrying on a special investigation of stellar spectra by means of photography. With these instruments extremely valuable results have already been obtained. In 1887 a fund amounting to \$238,000, left by Uriah A. Boyden for conducting astronomical observations at such a height as to be free so far as possible from the injurious effects due to the atmosphere, was transferred to Harvard College. Experiments, mainly in the line of stellar photography, are being conducted by Prof. Pickering in carrying out the provisions of this trust. A high altitude station in the southern hemisphere will be occupied and a series of observations carried on in co-operation with a similar station in the United States. A 13-in. equatorial, designed by Prof. Pickering, adapted to either visual or photographic purposes, has been built by the Clarks, and a second telescope of 8-in. aperture is mounted on the same stand. A complete photographic

laboratory is fitted up in an adjoining building. The funds of the observatory, which in 1875 amounted to \$164,067, and in 1885 to \$226,988, were increased by a bequest from R. T. Paine, in 1886, to \$398,046, placing the observatory on a very satisfactory financial footing. An extensive time-service, established in 1871, also contributes to the support of the institution. Seventeen quarto volumes of *Annals* have been published, and a report of the director appears each year as an appendix to the report of the president of the college. The Harvard Observatory is the central station in the United States for the telegraphic distribution of astronomical information. Directors: W. C. Bond, 1839; G. P. Bond, 1859; Joseph Winlock, 1866; E. C. Pickering, 1877.

Cambridgeport, Mass. Mr. E. F. Sawyer's private observatory; lat. $+42^{\circ}21'56''$, long. $4^{\circ}44'23''$ W.; $3\frac{1}{2}$ Bordan equatorial used for observations of variable stars and meteors; several interesting variables of short period have recently been discovered.

Chicago, Ill. Dearborn Observatory, lat. $+41^{\circ}50'17''.0$, long. $5^{\circ}50'26''.8$ W. Founded by the Chicago Astronomical Society in 1862-63, and attached to the University of Chicago. Principal instruments, 18 $\frac{1}{2}$ -in. Clark equatorial, and 6-in. Repsold meridian circle. The equatorial has been mainly devoted to double-star work by Burnham and Hough. With the meridian circle, work was begun upon the *Astronomische Gesellschaft* zone, $+35^{\circ}$ to $+40^{\circ}$, but was not completed. Since 1871 this instrument has been used for determining time for the city of Chicago. Directors: T. H. Safford, 1865; E. Colbert, 1874; G. W. Hough, 1879.

In 1888 the observatory was transferred to the North-western University, and the instruments were mounted in a new building at Evanston, Ill., 16 miles N. and 3 miles W. of the old site.

Cincinnati, Ohio, lat. $+39^{\circ}8'19''.5$, long. $5^{\circ}37'41''.2$ W. The Cincinnati Observatory was founded in 1841-43 by the Cincinnati Astronomical Society, and owes its existence to the energy and eloquence of Prof. O. M. Mitchel. A new building was erected in 1873 upon Mount Lookout, about 4 miles E. and 2 miles S. of the central part of the city, the observatory having become in 1872 a department of the University of Cincinnati. The instruments are: an 11 $\frac{1}{2}$ -in. equatorial made by Utschneider & Fraunhofer, finished by Merz & Mahler, and objective refigured by Clark; 4-in. equatorial, by Clark; 3-in. transit, by Buff & Berger; clocks, chronometer, chronograph, etc.; a 5 $\frac{1}{2}$ -in. meridian circle, by Fauth, was added to the equipment in 1888. Directors: O. M. Mitchel, 1842; H. Twitchel, 1859; W. Davis, 1861; C. Abbe, 1868; O. Stone, 1875; J. G. Porter, 1884. Observations of double stars and comets made with the equatorial and a zone-catalogue observed with the transit have filled nine numbers of *Publications*.

Clinton, N. Y., Litchfield Observatory of Hamilton College, lat. $+43^{\circ}3'17''.0$, long. $5^{\circ}1^{\circ}37'.4$ W. Founded by subscription, 1852-55; 13 $\frac{1}{2}$ -in. equatorial by Spencer & Eaton, 4-in. equatorial by Steinheil, 5-in. altazimuth by Schröder, clock, chronometer, chronograph, and spectroscope. With the 13 $\frac{1}{2}$ -in. equatorial Dr. C. H. F. Peters, the director, has constructed a series of ecliptic charts, and in the course of this work he has discovered 47 asteroids.

Columbia, Mo., Laws Observatory of the University of the State of Missouri, lat. $+38^{\circ}56'$, long. $6^{\circ}9'18''$ W.; 7 $\frac{1}{2}$ -in. Merz equatorial, 4 $\frac{1}{2}$ -in. Fitz equatorial, 2 $\frac{1}{2}$ -in. Brunner meridian circle, altazimuth clocks and minor apparatus; used mainly for instruction.

Crete, Nebraska. Boswell Observatory of Doane College (1883); 8-in. Clark equatorial, Buff & Berger transit, clocks, break-circuit chronometer, and meteorological apparatus. Building and instruments cost \$7000.

Denver, Col. A new observatory, the gift of Mr. H. B. Chamberlin to the University of Denver, is in course of construction about 6 miles from the centre

of the city, at a height of 5000 feet above sea-level. The principal instrument will be a 20-in. Clark equatorial. Director, H. A. Howe.

Evanston, Ill., Dearborn Observatory, transferred from Chicago in 1888.

Geneva, N. Y., Smith Observatory, lat. $+42^{\circ}53'$, long. $5^{\circ}8''$ W. Built by William Smith in 1888; equatorial of 10 $\frac{1}{2}$ in. aperture, 9 ft. 9 in. focal length, object-glass by Clacey, mounting by Warner & Swasey, provided with a photographic corrector of the same aperture, spectroscope, micrometer, etc.; a 4-in. meridian circle by Warner & Swasey; a sidereal clock wound automatically by a small electro-motor, and a chronograph. Also a 9-in. silver on glass reflector, a 5-in. reflector, and several smaller instruments constructed by the director, Mr. W. R. Brooks, and formerly used at the Red House Observatory, Phelps, N. Y., in the discovery of 13 comets.

Georgetown (D. C.) College Observatory, lat. $+38^{\circ}54'26''.2$, long. $5^{\circ}8'18''.3$ W. Erected in 1843-44; 4.8-in. Simms equatorial, 4-in. Troughton & Simms meridian circle, and 4.6 in. Ertel transit. The equatorial was used by Sestini in 1850 for a series of observations of sun spots. A single volume of *Annals*, giving a description of the building and instruments, was published, in 1852, by James Curley.

Glasgow, Mo., Morrison Observatory, lat. $+39^{\circ}13'45''.6$, long. $6^{\circ}11'18''$ W. Founded in 1874 by Miss Berenice Morrison; 12 $\frac{1}{2}$ -in. Clark equatorial, 6-in. Troughton & Simms meridian circle, clocks, chronometer, and chronograph. Volume I. of the *Publications* issued in 1887 contains a description of the observatory, and observations of planets, comets, and double stars. Time signals have been sent to Kansas City and St. Louis, and over the line of the Chicago and Alton Railroad. Director, C. W. Pritchett.

Greencastle, Ind., McKim Observatory, lat. $+39^{\circ}37'$, long. $5^{\circ}46'30''$ W. The gift of Mr. Robert McKim to De Pauw University, 1885; entire cost \$10,000. The principal instrument is a 9 $\frac{1}{2}$ -in. equatorial; an almucantar is used for time observations.

Grinnell, Iowa. Mr. Grinnell has provided Iowa College with an astronomical observatory mounting an 8-in. Clark equatorial (1887).

Hanover, N. H., Shattuck Observatory of Dartmouth College, lat. $+43^{\circ}42'15''$, long. $4^{\circ}49'8''$ W. Founded in 1853; 9 $\frac{1}{2}$ -in. Clark equatorial, 4-in. Troughton & Simms meridian circle, clocks, chronograph, and spectroscopes. Directors: C. A. Young, 1853; C. F. Emerson, 1878.

Hastings, N. Y., Prof. Henry Draper's Observatory, lat. $+40^{\circ}59'25''$, long. $4^{\circ}55'29''.7$ W. Built in 1860; 28-in. reflector made by Prof. Draper, 11-in. refractor with photographic corrector by Clark, used until Prof. Draper's death in 1882 for experiments in astronomical photography; in 1886-87 they were removed to the Harvard College Observatory.

Haverford (Pa.) College Observatory, lat. $+40^{\circ}0'40''.1$, long. $+5^{\circ}1^{\circ}12''.7$; 8 $\frac{1}{2}$ -in. Fitz equatorial, refigured by Clark, 4-in. meridian circle, 1 $\frac{1}{2}$ -in. zenith telescope, 8 $\frac{1}{2}$ -in. Brashear reflector, clocks and chronograph. The observatory was rebuilt in 1883 and provided with a 10-in. Clark refractor. Directors: Jos. G. Harlan, 1853; S. J. Gummere, —; Samuel Alsop, Jr., 1875; Isaac Sharpless, 1882; F. P. Leavenworth, 1887.

Hillsborough, Ohio, private observatory of Henry A. Pavey; 4-in. equatorial by Benj. Pikes' Sons.

Iowa City, Iowa, private observatory of C. W. Irish, lat. $+41^{\circ}39'.8$, long. $6^{\circ}6'4''$ W.; 4-in. equatorial by Chevalier.

Lancaster, Pa., Daniel Scholl Observatory. Erected in 1887; attached to Franklin and Marshall College; 11-in. equatorial, objective by Clark, mounting by Repsold, 3-in. transit, clock chronometer and chronograph.

Lewisburg, Pa., Bucknell University Observatory. Founded in 1887 by Mr. William Bucknell. The build-

ing is of brick, 25 ft. by 50 ft., a dome 16 ft. in diameter surmounting the central tower; the instruments are a 10-in. Clark equatorial and a 3-in. Ertel transit, chiefly for instruction. The entire cost was \$10,000. Director, W. C. Bartol.

McCormick Observatory. See *University of Virginia*.

Madison, Wis., Washburn Observatory, lat. $+43^{\circ}4'36''$, long. $5^{\circ}57'37.9$ W. Built in 1878-80 by Gov. C. C. Washburn at a cost of about \$50,000, and presented to the University of Wisconsin. The instruments are a 15½-in. Clark equatorial, 4.8-in. Repsold meridian circle, chronograph, clocks, chronometers, etc. A 6-in. Clark equatorial, formerly the property of S. W. Burnham, and a 3-in. Fauth transit are mounted in a students' observatory adjoining the main building. The equatorial has been used for observations of double stars, comets, and nebulae; the meridian circle for observations of Anwers' 303 southern stars. Directors: J. C. Watson, 1879; E. S. Holden, 1881; J. E. Davies, 1886; G. C. Comstock, director, Asaph Hall, consulting director, 1887. Five volumes of *Publications* have been issued.

Mount Hamilton, Cal., Lick Observatory of the University of California, lat. $+37^{\circ}20'23''.5$, long. $8^{\circ}6'34''.1$ W., height above sea-level, 4302. Founded by James Lick through a deed of trust dated Sept. 21, 1875, in which he devoted \$700,000 to the construction of a telescope "superior to and more powerful than any telescope ever yet made . . . and also a suitable observatory connected therewith." The work of construction was begun by the Lick trustees in 1880, and the observatory was completed and delivered, in accordance with the terms of Mr. Lick's will, to the Regents of the University of California, June 1, 1888. In the main building are computing-rooms, a library, and the domes for the 36-in. and 12-in. equatorials, and detached buildings contain a 6½-in. Repsold meridian circle, 6½-in. Warner & Swasey equatorial, 4-in. Fauth combined transit and zenith telescope, and 5-in. horizontal photoheliograph, the objectives for all these instruments being furnished by Alvan Clark & Sons. A 4-in. Clark comet-seeker, 2.1-in. Repsold universal instrument, 5 clocks, 5 chronometers, 3 chronographs, measuring engine, and minor apparatus complete the equipment. The visual objective of the great equatorial has a clear aperture of 36 in. and focal length of 56 ft., 6 in.; the flint disc for this objective was obtained by Clark from Feil & Co., of Paris, in 1882, and after nineteen failures the crown was cast by the same makers in 1885. The objective was completed and delivered by the Clarks in 1886. It cost \$51,000 and weighs, with its cell, about one-third of a ton. In 1887 a third (crown) lens of 33 in. aperture and 46 ft. focal length was procured, at a cost of about \$14,000, as a "photographic corrector." The equatorial mounting was made by Warner & Swasey and put in place in 1887 for \$42,000. The total weight of the telescope is about 40 tons. The dome is of steel, 75 ft. in diameter, and has a floor movable vertically 16½ ft. The cost of the dome and floor was \$56,800. Volume I. of the *Publications*, issued in 1887, contains a description of the buildings and instruments, a list of double stars discovered and measured by Mr. Burnham upon the site of the observatory in 1879 and 1881, observations of the transit of Mercury in 1881 and of the transit of Venus in 1882, and an extensive series of reduction tables. A time-service is in operation over the whole Pacific system of railways from Ogden to El Paso. The observatory has an endowment fund of somewhat over \$100,000 remaining from the original bequest of \$700,000, and the further expenses are provided for by the Regents of the University. Director, E. S. Holden.

Nashville, Tenn., Vanderbilt University Observatory, lat. $+36^{\circ}8'58''.2$, long. $5^{\circ}47'12''.8$ W., 6-in. Cooke equatorial, 4-in. Ertel meridian circle, 3-in. Cooke altazimuth, clocks, and chronograph. A 5-in. portable

refractor was used by Mr. E. E. Barnard in the discovery of a number of comets.

New Haven, Conn., Observatory of Yale University, lat. $+41^{\circ}18'36''.5$, long. $4^{\circ}51'42''.2$ W. In 1830 a 5-in. refractor was purchased from Dollond and mounted in the steeple of one of the college buildings; subsequently a 3.8-in. meridian circle by Ertel, formerly the property of the U. S. Naval Observatory, a meridian transit with object glass by Fitz, mounting by Prof. C. S. Lyman, a 9-in. Clark equatorial, a 4-in. transit by Troughton and Simms, and minor instruments were added to the equipment. In 1882 a new observatory was built and supplied with a 6-in. Repsold heliometer (cost \$7500) and an 8-in. Grubb equatorial. A time-service and bureau for testing thermometers were established in 1880. Volume I., part 1, of *Transactions*, published in 1887, contains Dr. Elkin's heliometer measures of the brighter stars in the group of the Pleiades. Directors: E. Loomis, 1831; D. Olmsted, 1836; C. S. Lyman, 1847; H. C. Newton, 1882. Since 1884 the observatory has been in charge of a board of directors.

Newington, Conn., private observatory of D. W. Edgcomb; lat. $+41^{\circ}44'0''$, long. $4^{\circ}46'47''$ W.; 9.4-in. Clark equatorial.

New Windsor, Ill., private observatory of E. L. Larkin; lat. $+41^{\circ}13'$, long. $6^{\circ}1^m52''$ W.; 6-in. Clark equatorial.

New York, N. Y., Columbia College Observatory, lat. $+40^{\circ}45'23''.1$, long. $4^{\circ}55'53''.7$ W. The observatory is upon the top of the library building of Columbia College, the floor being 100 ft. above the level of the street. Instruments: 5-in. equatorial, combined transit and zenith telescope, clocks, chronometers, spectroscopes, etc. To these were added in 1884 the instruments of Mr. L. M. Rutherford's observatory, a 13-in. equatorial with photographic corrector, 3-in. Stackpole transit, and other apparatus. Director, J. K. Rees.

New York, N. Y., private observatory of L. M. Rutherford, lat. $+40^{\circ}43'48''.5$, long. $4^{\circ}55'56''.6$ W.; 13-in. equatorial by Rutherford & Fitz, used for celestial photography, 3-in. Stackpole transit. The instruments were dismounted in 1884 and presented to Columbia College.

Northampton, Mass., Smith College Observatory, lat. $+42^{\circ}19'7''$, long. $4^{\circ}50'32''.9$ W. Erected in 1886; a one-story brick building containing an equatorial room, photographic dark-room, library, clock-room, and transit-room. The equatorial is of 11 in. aperture, objective by Clark, mounting by Warner & Swasey, meridian circle of 4-in. aperture by Warner & Swasey, and chronograph by the same makers. A spectroscope for solar and stellar work is fitted to the equatorial. Director, Miss Mary E. Byrd, 1887.

Northfield, Minn., Carleton College Observatory, lat. $+44^{\circ}27'40''.8$, long. $6^{\circ}12'35''.9$ W. Erected in 1878; 8½-in. Clark equatorial, 3-in. Fauth transit, clocks, chronometer, chronograph, and minor instruments. The observatory was rebuilt in 1886-88, and the 8½-in. refractor provided with a photographic corrector. A Repsold meridian circle with object glass 4.8 in. aperture, by Clark, was mounted in 1887. Time signals are sent out over several railroads. Director, W. W. Payne.

Oakland, Cal., Chabot Observatory, lat. $+37^{\circ}48'5''$, long. $8^{\circ}9'6''.4$ W. Presented to the city of Oakland in 1886 by Mr. Anthony Chabot. Instruments: an 8½-in. equatorial with micrometer and spectroscope, a 4½-in. transit, chronograph, and clocks. Director, F. M. Campbell.

Omaha, Neb., Creighton College Observatory, lat. $+41^{\circ}16'6''$, long. $6^{\circ}23'47''$ W.; 5-in. equatorial by I. H. Steward, London; 3-in. transit circle by Fauth, clocks, chronograph, etc. A 12-in. equatorial will be added to the equipment.

Phelps, N. Y., Red House Observatory, lat. $+42^{\circ}58'$, long. $5^{\circ}8'24''$ W.; 9-in. and 5-in. silvered glass

reflectors, both by the owner, W. R. Brooks. The instruments were removed in 1888 to the Smith Observatory, Geneva, N. Y. They have served in the discovery of 13 comets.

Poughkeepsie, N. Y., Vassar College Observatory, lat. $+ 41^{\circ} 41' 18''$, long. $4^{\circ} 55' 33.6''$ W. Built in 1878; 12 $\frac{1}{2}$ -in. Clark equatorial, 3 $\frac{1}{2}$ -in. meridian circle, clock, chronometer, chronograph. Miss Maria Mitchell was succeeded as director by Miss M. W. Whitney in 1888.

Princeton, N. J., Observatory of Princeton University, consisting of the observatory of the J. C. Green School of Science, lat. $+ 40^{\circ} 20' 57''.8$, long. $4^{\circ} 58' 37.6''$ W. and the Halsted Observatory. The J. C. Green Observatory was built in 1877 for instruction in practical astronomy, and contains a 9 $\frac{1}{2}$ -in. Clark equatorial, 4-in. Fauth meridian circle, 3-in. Fauth transit, 2 $\frac{1}{2}$ -in. Kahler transit, Ayerigg transit mounted in the prime vertical, besides clocks, chronometers, and subsidiary apparatus. The Halsted Observatory has a 23-in. Clark equatorial (mounted in 1883), provided with several large spectroscopes. Director, C. A. Young.

Providence, R. I., private observatory of F. L. Seagrave, lat. $+ 41^{\circ} 49' 46''.4$, long. $4^{\circ} 45' 37.6''$ W.; 8 $\frac{1}{2}$ -in. Clark equatorial, with Browning spectroscope.

Rochester, N. Y., Warner Observatory, lat. $+ 43^{\circ} 8' 15''$, long. $5^{\circ} 11' 20''$ W. Erected in 1879-80 by H. H. Warner; 16-in. Clark refractor, used mainly in the search for new nebulae. Director, Lewis Swift.

St. Louis, Mo., Observatory of Washington University, lat. $+ 38^{\circ} 38' 3''.6$, long. $6^{\circ} 0' 49.1''$ W.; 6 $\frac{1}{2}$ -in. Fitz equatorial, 2.6-in. Würdemann transit, clocks, spectroscope, photometer, etc. An extensive time-service is maintained. Director, H. S. Pritchett.

San José, Cal., Observatory of the University of the Pacific (1885); 6-in. Clark equatorial, Fauth transit. Director, J. C. George.

South Evanston, Ill., Observatory of Dr. Marshall D. Ewell, built in 1886, 10.8 miles south of Chicago. The instruments are a 6 $\frac{1}{2}$ -in. Clark equatorial, mounted on a pier made of Portland cement and sand, a 2 $\frac{1}{2}$ -in. Troughton & Simms transit, a sidereal and a mean time clock, and subsidiary apparatus.

South Hadley, Mass., Observatory of Mount Holyoke Seminary, lat. $+ 42^{\circ} 15' 18''.2$, long. $4^{\circ} 50' 20.3''$ W.; 8-in. Clark equatorial, 3-in. Fauth meridian circle, clock, and chronograph. The building and its equipment cost about \$10,000.

Syracuse, N. Y., Observatory of the University of Syracuse. Founded in 1887; 8-in. Clark equatorial, 3-in. Troughton & Simms transit, clock, chronometer, and chronograph. Director, J. R. French.

Tarrytown, N. Y., private observatory of C. H. Rockwell, lat. $+ 41^{\circ} 4' 21''$, long. $4^{\circ} 55' 24.9''$ W.; 6 $\frac{1}{2}$ -in. equatorial, object glass by Dr. C. S. Hastings, mounting by Byrne. An almucantar is used for determining time.

Troy, N. Y., Williams Proudfit Observatory, lat. $+ 42^{\circ} 43' 52''$, long. $4^{\circ} 54' 45''$ W. Attached to the Rensselaer Polytechnic Institute; 3.5-in. Fitz equatorial, 2.5-in. Kübel transit, 2-in. Phelps & Gurley transit, clocks, and chronometer. Director, Dascom Greene.

University of Virginia, Va., McCormick Observatory, lat. $+ 38^{\circ} 2' 1.2''$, long. $5^{\circ} 14' 5.2''$ W., near Charlottesville. A small astronomical observatory was built by Thomas Jefferson in 1825, but no instruments were mounted, and the building was removed in 1855 or 1856. The present observatory was built in 1883-84 at a cost of about \$70,000, of which \$64,000 was the gift of Leander J. McCormick. A working fund of \$25,000 was given by W. H. Vanderbilt, and an endowment of \$50,000 was subscribed by the alumni of the university. In 1882 Prof. Ormond Stone was chosen director, and the observatory was dedicated Apr. 13, 1885. The principal instrument is a 26-in. Clark equatorial, used for the study of faint nebulae

and the observation of comets and double stars. There is also a 4-in. equatorial by Kahler and a 3-in. transit by Fauth.

Washington, D. C., U. S. Naval Observatory, lat. $+ 38^{\circ} 53' 38''.8$, long. $5^{\circ} 8' 12.09''$ W. Founded in 1842 by act of Congress as a depot of charts and instruments for the navy. Numerous efforts, beginning in 1810, had been made to obtain authority and funds for a national observatory, but without success. In 1838 a series of observations was begun by Lieut. J. M. Gilliss in a small observatory upon Capitol Hill, connected with the depot of charts, in co-operation with the Wilkes expedition. These observations were continued until 1842, when the sum of \$25,000 was appropriated for the erection of a more permanent and suitable depot. The building, as planned by Lieut. Gilliss, was completed in 1844. Additions were made in 1847, 1848, 1868, and 1873. The following instruments have been in use: 4.1-in. Troughton & Simms mural circle (mounted in 1844); 5.3-in. Ertel transit (mounted in 1844, object-glass reground by Clark in 1862); 4.9-in. Pistor & Martins prime vertical transit (1845); 9.6-in. Merz & Mahler equatorial (1845); 4-in. Utschneider & Fraunhofer comet-seeker; 3.8-in. Ertel meridian circle; 6.6-in. Ertel refraction circle; 8.5-in. Pistor & Martins transit circle (1866); 26-in. Clark equatorial (1873; cost, \$46,000). There are also 4 chronographs, 6 clocks, chronometers, and subsidiary apparatus, and the photoheliographs, transits, equatorials, and other instruments used by the American parties in observations of the transits of Venus in 1874 and 1882 are stored here. The 26-in. equatorial has been used principally in the measurement of faint double stars and satellites and in observations for stellar parallaxes. With this instrument Prof. Hall discovered in 1877 the two satellites of Mars. The chronometers for issue to naval vessels are rated and tested in a suitably built room in the observatory, and an extensive time-service is maintained, involving the automatic correction daily of about 250 Gardner clocks in the various government departments in Washington and the dropping of time-balls at New York, Philadelphia, Baltimore, Washington, Hampton Roads, Savannah, and New Orleans. Thirty quarto volumes of observations and memoirs have been published, besides the annual report of the superintendent, which is appended to the report of the Secretary of the Navy. In 1880 a new site for the observatory was purchased about $1\frac{1}{2}$ mile north and $\frac{1}{4}$ mile west of the present location, the latter being regarded as unhealthy and the efficiency of the instruments being impaired there by the fogs and the proximity to the Potomac River. Plans for the new buildings were prepared, but Congress failed to make any appropriation for their construction until 1886, when \$100,000 were made available for this purpose with the provision that the total cost should not exceed \$400,000. New plans were prepared, their main feature being the erection of small detached buildings for each of the principal instruments, while the offices and computing-rooms are united in a main building, and work was begun in the autumn of 1888. The observatory as a naval institution comes under the bureau of navigation, and line officers of the navy are detailed at intervals to perform the duties of superintendent. The following officers have held this position: M. F. Maury, 1844; J. M. Gilliss, 1861; C. H. Davis, 1865; B. F. Sands, 1867; C. H. Davis, 1874; John Rodgers, 1877; S. C. Rowan, 1882; R. W. Shufeldt, 1883; S. R. Franklin, 1884; G. E. Belknap, 1885; A. D. Brown, 1886; R. L. Phythian, 1886.

West Point, N. Y., Observatory of the United States Military Academy, lat. $+ 41^{\circ} 23' 31''$, long. $4^{\circ} 55' 49.4''$ W. Erected in 1839; 9 $\frac{1}{2}$ -in. Fitz equatorial, 4.6-in. transit by Ertel & Son (mounted in 1843), 4-in. mural circle by Troughton & Simms, and several smaller field-instruments. The instruments are used almost entirely for the instruction of cadets.

A new observatory was built in 1883; lat. $+41^{\circ} 23' 22''$, long. $4^{\circ} 55' 50.6''$ W., 480 ft. above sea-level, containing a 12-in. Clark equatorial, mounted in 1884, and an 8-inch Repsold meridian circle, mounted in 1885.

Willis's Point, N. Y., Observatory of the U. S. Army Engineers' School of Application; intended for instruction of engineer officers in the applications of practical astronomy to geodesy. Originally built in 1868, lat. $+40^{\circ} 47' 17''$, long. $4^{\circ} 55' 7.5''$ W.; rebuilt in 1879, lat. $40^{\circ} 47' 21''$, long. $4^{\circ} 55' 7.7''$ W. Instruments: a $5\frac{1}{2}$ -in. equatorial, objective by Clark, mounting by Fauth; a 3.8-in. equatorial by Tulley; a Lingke combined transit and zenith telescope of 24 inches; a 2.6-in. Stackpole Russian transit, also adapted for use as a zenith telescope; a 2-in. Troughton transit; a 2-in. Stackpole transit; and a 2.6-in. Würdemann zenith telescope; chronograph, chronometers, and sextants. Results of observations for time and latitude, and an extensive series of observations of auroræ are published in *General Orders*.

Williamstown, Mass., Observatory of Williams College, lat. $+42^{\circ} 42' 49''$, long. $4^{\circ} 52' 53.5''$ W. The old or Hopkins Observatory was built in 1836-37 (dedicated June 12, 1838), and furnished with a $7\frac{1}{2}$ -in. Clark equatorial and $3\frac{1}{2}$ -in. Troughton & Simms transit. The Field Memorial Observatory was built in 1882 and a $4\frac{1}{2}$ -in. Repsold meridian circle was mounted on June 24 of that year. Directors: Albert Hopkins, 1836; T. H. Safford, 1879 (?).

Ypsilanti, Mich., State Normal School Observatory, lat. $+42^{\circ} 13'$, long. $5^{\circ} 34' 22''$ W.; 4-in. Clark equatorial, $1\frac{1}{2}$ -in. Gurley transit.

OBSTETRICS is that branch of medical science which treats of midwifery, child-bearing, parturition, pregnancy. Midwifery has always been regarded as having only to do with the needs of the woman in her hours of delivery; hence, according to ancient laws, the midwife was expected to care for the woman at this time only, and when occasion demanded aid prior to or after the accomplishment of the birth of the child she was required to call in a physician or surgeon as the case might be. Custom subsequently more or less joined to medical treatment of parturition the care of the diseases of women, and also of children, but since the study of gynecology has so wonderfully progressed, the advanced schools of medicine have separated these subjects, and very judiciously, in many instances, they are entrusted to separate departments for study.

The word *obstetrics* is derived from the Latin *obstare*, to stand before; literally the obstetrician is one who stands before the woman to render her aid in her delivery of a child. The art of delivery has long claimed the attention of all classes, nor is this to be wondered at when we consider that child-bearing is connected with the foundation of the welfare of all races, and that during a fixed time the pregnant woman is an object of the greatest solicitude. At first, as was natural, women alone were regarded as best fitted to be able to render the needed service, and hence midwifery or obstetrics was relegated to the care of women, and so remained for ages. Indeed, at the present time, in many lands, women only are permitted to be present on such occasions, and, in fact, some tribes regard these matters as unfit for the notice of any save the lowest members of their community, and even regard the condition and presence of the pregnant woman as unlucky and likely to cause evil results.

The earliest allusion to the obstetric art is in ancient Jewish history. At first, it appears, there was reluctance to interfere during labor, and only such aid was given as became absolutely necessary in the separation of the child, leaving everything else to the efforts of nature. But as time elapsed, people in attendance on such occasions involuntarily used their common sense in aid of the efforts of the woman, and thus, from observation and experience, some became more skilled and regarded as specially able to aid in the delivery. Again, from seeing what nature unaided could do in difficult labors, they were encouraged to imitate these efforts or aid them, and finding such aid to be followed by good results, a similar plan was employed in subsequent cases at an earlier moment. Thus, step by step, was built up the obstetric art, and then arose a skilled band whose aid was demanded and relied upon when the emergency occurred.

In all history we find but little allusion to the art or any advances therein until the advent of Hippocrates, about 450 B. C. Up to this time as there was but little study of anatomy very little was known of the structure and relation of the parts to each other. Upon obstetrical subjects we find that Hippocrates wrote treatises entitled *De Natura Muliebri*, *De Mulierum Morbis*, and *De Superfetatione*, showing that in his time something at least must have been known of the diseases to which women are specially subject, as also upon the subject of twins or triple pregnancy. His views of conception and generation, though for many years regarded as correct, have been shown in the light of modern investigation to be very erroneous. Evidently, he had obtained in some way, possibly by the study of inferior animals, a knowledge of the ovum and its mechanical expulsion. Of course difficult delivery would be most thoroughly investigated, and we find also that he treats of the various ways by which the child presents for delivery and alludes to the different positions of the placenta or after-birth.

A singular belief which still retains a great deal of vitality is alluded to in his work entitled *De Natura Pueri*. This is that the fetus delivered at the seventh month of pregnancy has a better chance for life than one at the eighth month. A similar belief is also to be found in a rabbinical treatise of the third century, called *Midrash Rabbah*, a work on the book of Exodus by Rabbah, which says "a child can live at seven months and not at eight."

At this time it appears that when the midwife failed in delivering the woman the aid of the surgeon was demanded to accomplish it by force, and we find that Hippocrates counsels the use of means to break up the head of the child, and the extraction of the body by hooks, etc. The Cesarean section, or opening the womb through the abdomen, would appear to have been an operation performed in very early times. Upon this subject, those who are desirous of investigating more thoroughly should read the valuable essay by Robert P. Harris, M. D., of Philadelphia. It has been believed, however, that in all cases such an operation was only attempted after the death of the woman, while in recent times we have records of instances where women have been subjected to it not once but twice, and have survived to a good age. This statement must be taken with some allowance, for we find in the Jewish *Mishna*, a collection written about A. D. 180, the question debated as to whether a woman was unclean who had the child taken by an operation from her side. Hence it is probable that cases had occurred where a mother had survived this ordeal.

About the VIIth century Paulus Aegineta appears to have practised midwifery, and we have quotations from him as to the delivery of the child where nature had been unable to accomplish the task. It is remarkable to what extent people were led to believe in multiple births, prodigies, etc. We can in the light of these days understand the reports of fetuses being passed by the bowels, from abdominal abscesses, or

even where portions had been ejected from the stomach. One would have supposed that a subject of so much importance, one connected so immediately with the growth of nations, would have attracted marked study in every quarter; but when we reflect upon the very low estimate placed upon women by barbarous nations, both of ancient and modern times, we find less cause for surprise. Slowly, as civilization progressed, as the means for learning were multiplied, we find a gradual advance in the study of obstetrics.

Perhaps one reason for the apparent neglect of this important branch of medical science is to be found in the fact that delayed, tedious labors are so exceptional, so rare that, except where disease or injury has caused deformity, but little aid would seem to be demanded. Not more than one case in every hundred can truly be regarded as other than a strictly natural easy labor, and this small number of cases are only delayed by causes generally capable of a natural solution. When we come to those which may be regarded as tedious or obstructed labors and those positively demanding instrumental interference, the proportion ranges notably greater, to one in 1000 or even more. This proportion is even greater in the case of nations where females live according to the laws of hygiene. Much of the obstruction, the delay in delivery, is due to the artificial mode of living among civilized nations, producing loss of general nerve power, exhaustion, and even deformity of organs, and thus destroying that wonderful exact proportion which always exists in the healthy female between the measurements of her organs and those of her child. Hence we see that as nations advance in the so-called arts of civilization they often degenerate at least bodily, and there arises a need for the study of methods by which to counteract the evil results which are sure to follow. Of these obstructions in labor we may instance cranial disproportions either by reason of deficiency of the mother or by excess of the child, requiring for delivery a resort to the operation called craniotomy or destruction of the child's head in order to reduce its size so that it may pass through the unyielding parts of the mother. This was spoken of by Hippocrates, and undoubtedly for many years was performed under circumstances where the child's life might have been preserved. Perhaps the greatest improvement in the obstetric art at any time was the invention of the forceps, which occurred about the middle of the seventeenth century. Undoubtedly the introduction of this instrument aided greatly in the practical instruction of physicians in the art of delivery, and at first it was regarded as the means by which every life was to be saved and every labor abridged. Indeed its use became universal, and at one time bid fair to do as much harm as good, in consequence of the utter ignorance on the part of the profession as to the proper employment of this aid and the appropriate cases in which to invoke it.

Now, we find the whole range of obstetrics enlarged; it was found necessary to study the development of the ovum, to follow it from the period of impregnation down to the moment of delivery; then came the anatomy of the parts, their relations to each other and to the fœtus; the physiological action of all the organs which were associated in the functions of child-bearing; finally, the pathological conditions of those organs and their interference whether in delivery or in the process of gestation. These studies need to be regarded as incident to the life of woman during her entire procreative period, which is generally regarded as ranging from the 15th to the 45th year. These limits have been ascertained as the average of an immense number of observations, although, as in other departments, we have exceptions either way. Incidents are on record of the delivery of a girl at her 11th year, and on the other hand of a woman at her 64th year. The most prolific period is from the 25th to the 30th year. Nor are we to regard cessation of the visible sign, menstruation, as a proof that the woman has

passed the age of becoming pregnant. Instances constantly occur where, owing to this cessation for a number of years, women have been announced as suffering with a tumor when the event proved that they were pregnant.

In consequence of such occurrences as this, and also because at many times necessity would arise to demand a positive knowledge as to whether a woman was pregnant or the reverse, the study of the signs of pregnancy has occupied all practitioners of midwifery for many centuries, and perhaps we may say for all time. Again and again has an infallible sign been announced, only to be shown as entirely without value. One of the most pronounced of these was the peculiar substance found in the urine of pregnant women and called Kiesteine. This was known as early as 1839, and for a time there existed no doubt that the needed test was at last discovered, but when other investigators found it in the urine of women who were not pregnant and finally in that of men, the fabric dissolved as in a dream and this test is now entirely abandoned. The only positive sign, and one which once heard is conclusive, is the sound of the fœtal heart. This unfortunately can rarely if ever be heard until after quickening has occurred, and in many cases owing to other causes cannot be heard; hence, while its presence is positive, its absence is not a negative sign. The absence of the menstrual flow is usually a sign which leads to the search for contributory evidence, but this is very unreliable, as in some women menstruation never recurs during the period of childbearing; in others it may continue until the close of the latter months of pregnancy. Any one symptom then is not to be relied upon, but the presence of a number or the absence of others may be regarded as significant. Thus, when a woman of proper age is in apparent good health, the cessation of the menstrual flow, a gradual enlargement of the abdomen, with sickness or nausea in the morning, and a darkening of the areola around the nipple, would be symptoms to cause a strong belief that she was pregnant. If later, about 4½ months from the inception of these signs, there occurred at irregular intervals a peculiar feeling of fluttering or movement within the abdominal walls, known to women as the quickening, additional strength would be given to this belief. Another symptom of pregnancy which is regarded by many authorities as of special value is that of contraction of the womb at irregular intervals. This is noticed often at a very early period, and to many women is a positive proof that they are in the pregnant state. In the case of women, the walls of whose abdomen are not too much loaded with fat, this may be recognized by the physician by placing the hand upon the abdomen, and letting it remain for a short time. The sensation is then observed as though the uterine tumor slowly contracted beneath the hand. No decision should ever be made upon a few of these signs only, and it is always best to err on the safe side and act as though pregnancy were present than the reverse, as a number of unfortunate instances are on record where a failure to do this has been productive of mortifying results both to patient and physicians, and even death has followed.

The duration of pregnancy has been regarded by even learned authorities as very variable, but it is now generally conceded that about 300 days is the real limit, and by some governments this is the period allowed by law, where it may be necessary to decide the question.

During the first 15 or 16 weeks the cessation of pregnancy by the extrusion of the fœtus is called an abortion, after that it is a miscarriage. A belief which formerly was very common was that the fœtus was not endowed with life prior to the period of quickening. In fact, the credulous believed that this was the sign of the entrance of the soul, and that a delivery before that time was of no importance, and no criminality attached to any means which might be employed to

induce it. This highly dangerous belief led to the performance of the most outrageous practices on the part of those who did not wish to bear children. Fortunately, in the interest of humanity and the good of society, better instruction has promulgated the truth that the soul—the life—begins at the moment of conception, and the destruction of that life is equally criminal at any time. Ordinary natural labor should be regarded as a physical healthy act, and labor, whether that of miscarriage or abortion, is pathological, never occurring without more or less injury to the general system.

There are many diseases incident to pregnancy which become of importance as they may induce premature delivery, hence their study comes within the scope of the obstetrician. Of these may be mentioned excessive vomiting, occasionally going to such an extent as to bring on labor, or to so threaten the life of the woman as to bring up the question of the induction of labor for her relief; albuminuria, in which condition the blood becomes so loaded with injurious matter that the woman is often placed in a very critical condition, and is threatened with convulsions and death; disorders of the circulation and of the respiration; disorders of secretion and excretion; disorders of the nervous system; finally, serious displacements of the gravid womb.

Labor may be defined as the effort of the pregnant womb to extrude its contents, and it becomes natural or otherwise as it varies from the proper time for its occurrence, and as it is complicated or connected with disorders or disturbances which more or less interfere with its proper or speedy completion.

A natural labor rarely exceeds 24 hours in its duration. This is from the commencement of the dilatation of the mouth of the womb to the completion of delivery. Many accounts of labors of inordinate length are based upon a calculation from the inception of apparent labor pains. Instances are constantly occurring in which the labor has been regarded as extending over many days or even weeks. These are usually known as *false* pains, and are due to a variety of causes, as fatigue, excessive exertion, rheumatism, and the like. The first labor is usually longer in duration than any subsequent ones. So invariably is this the rule that it is generally safe for the obstetrician to predict a much shorter time and a more easy delivery in subsequent labors. Of course this alludes to such cases where it is known that there is no abnormal condition of the parts. Yet, even in cases where there has been great irregularity, nature unaided shows a wonderful power, spontaneous delivery having frequently taken place under the most untoward circumstances. This is the only means by which such monstrosities as the Siamese twins, or that more recent one, the double woman, could have been delivered alive and undivided.

At present the art of obstetrics has arrived at such a stage that the skill of the obstetrician is able to deliver alive and with safety to the mother many infants who otherwise must inevitably have perished, and perhaps have involved the mother, either causing her death or permanent invalidism. This is shown by the great success which now follows the operation of Cæsarean section; the scientific employment of the forceps; turning; and the induction of premature labor; the prevention or relief of puerperal eclampsia, etc. The study of the art of obstetrics is now regarded as of equal importance with the other branches of medicine, and is one of the seven fundamental branches, taught by a separate professor in all medical schools.

The best works for consultation in the study of obstetrics are those of Leishman, Churchill, Tarnier's Cazeaux, etc.

(W. B. A.)

O'CALLAGHAN, EDMUND BAILEY (1799-1880), antiquarian, was born at Mallow, Ireland, in 1799. He went to France in 1821, and to Canada in 1823. He

began the practice of medicine in 1827, but became editor of the Montreal *Vindicator* in 1834. After the insurrection of 1837 he removed to New York, and in 1848 he was appointed keeper of the historical manuscripts in the office of the secretary of state at Albany. In 1870 he removed to New York city, where he continued his historical labors till his death on May 27, 1880. He had edited for the State the *Documentary History of New York* (14 vols., 1849, *sqq.*); *Documents Relating to the Colonial History of New York* (11 vols., 1855-61); *Historical Manuscripts Relating to the War of the Revolution* (1868), and other works. He also published a *History of New Netherlands* (2 vols., 1845-48).

OCCUM, SAMSON (1723-1792), Indian preacher, was born near New London, Conn., about 1723. He was educated at Rev. Ebenezer Wheelock's Indian school, at Lebanon, Conn., and afterwards taught school at Montauk, L. I. In 1766 he was taken to England by Rev. Dr. Whitaker, who went to raise funds for the Indian schools. These funds became the endowment of Dartmouth College (*q. v.*). Occum after his return preached in Long Island, chiefly to the Indians. He wrote an account of the Montauk Indians and a hymn, "Awaked by Sinai's Awful Sound." He died at New Stockbridge, N. Y., in July, 1792.

OCEAN LIFE in most of its forms has been fully treated in the *ENCYCLOPÆDIA BRITANNICA*. This article treats briefly of the important discoveries that have been made of recent years concerning the life-forms of the deep sea, the unexpected and surprising information that has been attained by careful dredging under scientific direction. It was long believed, indeed, that the depths of the ocean were quite incapable of sustaining animal life from lack of the necessary conditions of food and light, and from the immense pressure of the water at great depths, and it was argued that the lowest limit of penetration of light, which was believed to be about 40 or 50 fathoms, probably formed the lower boundary of ocean life. Late research has disproved all this. It is now known that light penetrates the water to a considerably greater depth than was supposed, and that animal life of high forms exists far below the utmost possible limit of light penetration.

Scientific efforts to dredge the ocean bottom began in the last century, but none of these extended to great depths, and it was not until recently that dredging below the 100-fathom line was attempted. The earliest revelation as to the life-forms of the deeper ocean was made in 1819, when Sir John Ross, during his first Arctic voyage, sounded to a depth of 1000 fathoms, and brought up strange forms of life attached to his sounding-line. Yet it was not till 1838 that a strong interest in deep-sea dredging began to display itself, Dr. R. Ball, of Dublin, in that year devising a greatly improved form of the naturalists' dredge. Previously a square-mouthed dredge had been used, with a purse-net attached to hold the collections. He constructed his dredge with an oblong, narrow mouth of about 12 by 4 inches, and attached scraping edges to both sides, so that it might do its work no matter how it fell. In the same year the Wilkes exploring expedition did some deep-sea dredging, while in 1840 Sir James Ross dredged to a depth of over 400 fathoms, and proved that the sea was prolific at that depth. Many others, both in Europe and America, followed this example, but no greater depth was attained till 1860, when in the voyage of the *Bulldog*, sent to examine a proposed northern cable route, the sounding-line brought up 13 star-fishes from a depth of 1260 fathoms. These were attached to a part of the line that had lain for some time on the bottom, but many naturalists considered it possible that the animals might have clasped the line on its way up. A telegraph-cable, which had been laid across the Mediterranean from Sardinia to Africa, and which was lifted in 1861, was found to be covered with animals in parts that had been 2000 fathoms deep.

This was an evidence of the prevalence of life at that depth that could not be readily set aside.

Yet despite the many indications that had been perceived of the existence of a deep-sea fauna very little impression was made on the minds of naturalists, and, up to 1866, it was generally believed that the field below the 300-fathom line was barren of animal life. This theory was advocated by Edward Forbes, as a result of his researches in the Ægean Sea, and was generally accepted, the facts to the contrary being quietly ignored. The Mediterranean, indeed, is somewhat barren at great depths, though the existence of deep-sea life there has since been fully demonstrated.

Before this date, in fact, animal life had been shown to exist off the coast of Spitzbergen at depths of 1000 and 1400 fathoms, and the Prof. Sars, father and son, had made a series of systematic researches at considerable depths off the Norwegian coast. These were followed by similar researches made in 1867 by Mr. L. F. de Pourtales, of the U. S. coast survey. His explorations were made off the southern coast of the United States, and reached a depth of 680 fathoms. In the succeeding year the *Lightning* was sent out by the British admiralty to dredge, under the scientific direction of Dr. Carpenter and Prof. C. Wyville Thompson. In this expedition a depth of 650 fathoms was reached. The better adapted *Porcupine*, sent out in 1869, dredged to a depth of 1470 fathoms off the coasts of Ireland and Scotland, and, in her second voyage, reached over 2400 fathoms in the Bay of Biscay. At this great depth (2½ miles) life was found to exist abundantly, and animal forms from the protozoa to the mollusca were brought up.

During December, 1871, and in the early months of 1872 the coast-survey steamer *Hassler* conducted a series of deep-sea dredgings, under the scientific direction of Louis Agassiz. In 1871 the U. S. Fish Commission was organized, and from that time forward made deep-sea exploration an important part of its labors, under the direction of Prof. A. E. Verrill, who had been engaged in labors of this kind since 1864.

But the most important exploring expedition of this kind that has been made up to the present time is that of the *Challenger*, a vessel sent out in 1872 by the English government for the purpose of dredging the depths of the great oceans. The *Challenger* traversed the Atlantic and the Pacific in various directions, crossing the former ocean five times, her total length of voyage being 69,000 miles. She returned in May, 1876, bringing an exceedingly rich zoological collection, which has been carefully worked up by noted specialists, whose labors are represented by more than 30 bulky volumes. On three occasions the *Challenger's* dredge reached a depth of over 3000 fathoms (about 3½ miles), and in every case living forms were brought up from this extreme depth. The deepest sounding made was 4575 fathoms. For further particulars see article DREDGE in *ENCYCLOPEDIA BRITANNICA*.

Since the date of the *Challenger* voyage several important dredging explorations have been undertaken. Norwegian expeditions were sent into the northern seas in 1876, 1877, and 1878. The Germans, the Italians, and the French followed the same example, the voyage of the French ship *Talisman*, in 1883, from the coast of Morocco to the Azores and the Sargasso Sea, having yielded highly valuable results. The Americans have been equally active. From 1877 to 1880 the steamer *Blake* was engaged in deep-sea explorations in the region of the West India islands and the Gulf of Mexico. These researches, under the scientific direction of Alexander Agassiz, were fruitful in results, a summary of which has been recently given to the world in two highly interesting volumes. In the explorations of the *Blake* important modifications of the dredging-apparatus were made. The dredge used for deep-sea work is necessarily made much larger than the original *Ball* dredge, being about 4½ ft.

long and 1½ ft. wide. In addition to the collecting-bags long strands of teased-out hemp attached proved very serviceable in entangling star-fish, corals, and other spiny inhabitants of the great deep. The dredge, however, is now in part superseded by the beam-trawl, which under certain circumstances proves more serviceable. A trawl, of about 15 ft. in length, was used occasionally by the *Challenger*, and a similar implement is used almost exclusively by the United States Fish Commission. The improvements effected in the *Blake* explorations were to make the beam-trawl reversible, to alter the dredge so as to prevent it burying itself in the mud of soft bottoms, to substitute wire for hempen rope, and to modify the methods of hauling and reeling, these various changes adding greatly to the efficiency of the apparatus.

In 1884 the steamer *Fish-hawk* was built for the dredging and hatching operations of the Fish Commission, but her small size unfitting her for deep-sea work she was superseded by the *Albatross*, the best-equipped dredger for deep-sea work in existence. In her first voyage, in 1883, this vessel made a successful trawl in the Atlantic of 2949 fathoms. At present (1888) the *Albatross* is engaged in an extended voyage of exploration, and is employed in dredging in the Pacific, off the western coast of America. Very interesting results may reasonably be expected from this expedition.

This rapid survey of the history of the exploration of the ocean depths may be followed by an equally concise description of the zoological results. These have been extensive and important, and have altogether changed the views of naturalists as to the limits of ocean life. It is now known that instead of living beings being confined to the littoral zone and to the ocean surface, they exist in abundance at the greatest depths yet examined, every order of life below the air-breathers being represented, and the variety of species being possibly as great as that on the surface. It must be borne in mind that what has so far been done is but a beginning in this work. The dredge has swept at the most a few square miles of an ocean-floor represented by millions of square miles, and exploration must be prosecuted for centuries ere any complete conception of its zoology can be attained. So far no part of the ocean is better known in regard to its marine products than that adjoining the Atlantic coast of the United States. The diligent labors of explorers have given us much knowledge concerning both the littoral and the deep-sea life of this region of the waters.

Among the specimens brought up by the dredge are representatives of every class of marine life, including corals, sponges, echinoderms, annelids, crustacea, mollusks, and fishes, all of which, except the latter, exist at the greatest depths reached by the dredge. Fishes have been captured at a depth of 2900 fathoms, and probably reach as low as the others. As to the vast mid-stretch of the ocean, between the range of surface-forms and the bottom, nothing definite is known concerning its life-forms. There is some reason to believe that life is confined to the surface and the bottom regions, and that the intermediate zone is barren; but the researches as yet made have been insufficient to determine this satisfactorily. The most abundant organic deposits on the ocean bottom are made by minute creatures, the Radiolaria and Foraminifera, whose remains form a thick layer of calcareous ooze, which is inhabited abundantly by the shelled animals. (See PACIFIC OCEAN in *ENCYCLOPEDIA BRITANNICA*.) In those regions of the bottom wanting this ooze the animal forms are chiefly those without shells, such as the Annelida and the Holothuroidea.

The variety of animal forms that has been brought up from the ocean bottom is far too great for any attempt to particularize, and we can but give a general description of their characteristics. At first it was imagined by many that the deep sea would yield to us

near relatives of the animals of past geological eras, it being argued that the homogeneous temperature and conditions of the ocean bottom would be favorable to the persistence of antique forms. This theory has not been sustained by the facts. While indications of antiquity in some of the forms have been perceived, the great mass of them approach the surface forms in character, and present indications of originating in the descent of such surface forms. The range of deep-sea fishes is, indeed, very great. Certain forms which live in shallow water in some regions have been dredged from the greatest depths in others, and the presumption is that littoral forms are capable without great difficulty of adapting themselves to the widely different conditions of deep-sea life. This may serve also to explain the variety of colors of abyssal forms. The fishes are usually of dark color, though some are pink or silvery; but many of the crustaceans are of brilliant red hues, and the mollusks display considerable variety of coloration. Many of these animals, moreover, display features of protective mimicry, and others have burrowing habits. It is difficult to believe that these characters have arisen from the exigencies of a life passed in regions of darkness. They seem rather to indicate that these animals are descendants of surface forms, and have preserved some of their original features and habits.

There are two further things to consider: the food-supply of these animals, and the modifications in structure and mode of life necessarily resulting from life in a region destitute of sunlight and subjected to enormous pressure. In regard to food the active carnivorous forms, which include all the fishes, find an abundant supply in the more sluggish creatures which exist in such numbers. But the basis of all animal life must be a vegetable diet, and there is no indication of any plant forms growing on the ocean bottom. Plants need sunlight, if animals do not, and can only exist within the reach of its influence. Yet it is not difficult to ascertain the primary source of the deep-sea food-supply. The surface of the ocean is crowded with life, in extraordinary abundance and variety. In addition to the pelagic animals, minute algæ exist abundantly in the surface waters, and form the food of many of the animal forms. This pelagic life remains on the surface only during vitality. After death it immediately begins to sink, and there is probably a continuous rain of dead animals and plants descending with some rapidity to the ocean-floor. These forms possess considerable nutrient material, which probably decomposes very slowly, and long remains fit for food. It forms, as Dr. Carpenter remarks, a sort of broth, which collects on the bottom, and furnishes an abundant food-supply for the sluggish animals, which in their turn yield food to the more active carnivora. It is not difficult, therefore, to understand the existence of an extensive fauna in a region destitute of plants. The plant-life of the surface is the basis of the food of deep-sea animals.

The conditions of life in the depths of the ocean are remarkably unlike those existing at the surface. The absence of sunlight is one radical distinction, and the great pressure of the water is a second. At a thousand fathoms this pressure is about one ton to the square inch, and at the lowest depths reached it must be far more enormous. Yet there seems to be no difficulty in sustaining this pressure. The tissues of the animals are permeated with fluids, and the pressure, thus equalized, is probably not felt. Yet on bringing them to the surface the effect of the sudden diminution of pressure is clearly seen, particularly in the fishes, which often come up in a very dilapidated condition. The tissues of the deep-sea fishes are, indeed, very fragile. The bones are often light, fibrous, and nearly destitute of calcareous material, so that they may be penetrated by a sharp needle without injury to its point. The muscular system is also often feebly developed, the muscles being thin and the con-

nective tissue loose and feeble. It is probable that the pressure may have something to do with these conditions, the loose tissues being compressed so as to render them serviceable for swift and vigorous motion.

In addition to this characteristic of the tissues the deep-sea fishes present many abnormal conditions of structure, in some cases the head or the jaw being enormously developed, while the body is reduced to a ribbon form. Yet these strange creatures do not belong to new orders, but are simply modified varieties of surface types. Their most striking modification, however, is that due to the absence of natural light in their habitat. Many of them are organized so as to yield an artificial light—to serve as lamps in their dark abode—while a corresponding variation in their eyes has taken place. In certain cases their eyes are atrophied. Many of the gasteropoda, and some fishes and crustaceans, have thus become blind. These belong generally to antique types, and they often possess tactile organs of gigantic size, touch supplying with them the place of vision. But as a rule the eyes of deep-sea animals are of increased size, and sometimes are developed to huge proportions, as if to enable them to see well under conditions of very feeble illumination.

The fact is that the habitat of these animals is far from being the region of perpetual darkness which might naturally be supposed. Very many of the animals are self-luminous, this phosphorescence existing alike in fishes, echinoderms, crustacea, polyps, mollusks, and annelids, the light yielded being perhaps sufficient to diffuse a feeble illumination through the thickly peopled regions of the ocean cavern. The contents of the trawl, when drawn to the surface, are often brilliantly phosphorescent, many highly luminous anthozoa, ophiurans, hydroids, crustaceans, etc., yielding their quota of light. The bottom seems to be covered in some localities by forests of gorgonians, which become luminous when disturbed by currents, thus enabling the animals creeping or swimming through them to see for some short distance. It is supposed that this light may be protective, and intended to warn foes not to come too near the dangerous lasso cells of the well-armed light-givers.

The phosphorescent organs are not equally distributed among the various families of deep-sea fishes, though those in which they are absent have usually a well-developed muciferous system, the abundantly secreted mucus yielding the necessary luminosity. The phosphorescent organs vary considerably, and are divided into a number of classes. In one case the sides of the fish are covered with innumerable minute tubercles, raised above the skin, and supposed to be light-givers. Secondly, we find tubercles of larger size and less in number, which occur on the head as well as on the body. Thirdly, eye-like spots appear, white in preserved specimens but red or green in life. These are ranged at regular intervals along the lower sides of the body, and also occur on the head. Fourthly are large, flat, round spots of a mother-of-pearl brightness, which also extend in rows along the lower sides of the body and head, while isolated ones appear in other localities. Fifthly, more or less diffuse patches of a white glandular substance, of varying thickness and irregularly placed on the body, exist. There are two or three other conditions and arrangements, though the above given are the most important, and are sufficient to show that an extraordinary provision for lighting up the depths of the ocean has been made. This provision, with the unusual eye development, must make the deep-sea a much more agreeable place of abode than would naturally be expected. It is probable that these luminous organs are at the command of the fish, and are used to aid them in search of their prey. The organs near the eyes, for instance, are supposed to act on the principle of a bull's-eye lantern, to project a beam of light ahead. In other cases where the luminous organs are at the extremities of barbels

or tentacles their probable use is to attract unsuspecting prey.

Much more might be said in regard to these remarkable discoveries, but the above may serve as an epitome of their leading features. They have immensely widened the area of zoological science, and opened a field of research which cannot become exhausted for centuries to come, and which may yield in the future marvels of life which will serve to greatly modify our conclusions as to nature's powers and possibilities.

(C. M.)

O'CONOR, CHARLES (1804-1884), an American lawyer, was born in New York city, Jan. 22, 1804, his father having emigrated from Ireland in 1801. Admitted to the bar in 1824, his untiring industry was soon rewarded with a large practice. His successful management of the Forrest divorce case gave him a wide reputation. He was also employed in the noted will cases of Lispenard in 1843, of Parrish in 1862, and of Jumel in 1872. In 1855 he was appointed U. S. district attorney for New York, and in 1846 and 1864 he was a member of the Constitutional Convention of that State. In politics he was an extreme Democrat, and during the civil war he favored the cause of the South. At its close he was the leading counsel for Jefferson Davis when indicted for treason. His greatest legal efforts were made in the prosecution of William M. Tweed and his associates for the recovery of the public money which they had embezzled from the city of New York. The partial result he described in a volume called *Peccation Triumphant, being the Record of a Five Years' Campaign against Official Malversation*, 1871 to 1875. Yet O'Conor continued the campaign until he achieved substantial success, though not in the measure he desired. In 1872 he was nominated for President against his earnest protest by a small convention at Louisville, which was dissatisfied with Greeley as the Democratic candidate. In the succeeding campaign O'Conor received only 21,559 votes. In 1881 he removed his residence from Fort Washington, N. Y., to Nantucket, Mass. Still erect in stature and vigorous in health, he carried on professional work in New York city. On a trip thither, in April, 1884, he caught cold and he died at Nantucket, May 12. He was married in 1854, but had no children. His professional success was due to his indefatigable devotion to clients' interests, his thorough mastery of all the details of the most complicated cases, and his clear presentation of the law and facts of each. Though inclined to wit and humor at times, he did not permit it to diminish the force of his arguments. His large collection of cases and opinions was bequeathed to the Law Institute of New York, of which he had been president since 1869.

OERSTED, HANS CHRISTIAN (1777-1851), a Danish physicist, was born at Rudkjöbing, on the island of Langeland, Aug. 14, 1777. He was the son of an apothecary, and at an early age began his experiments. In 1799 he received the degree of Ph. D. at the University of Copenhagen, his thesis being *Architectonics of Natural Metaphysics*, a philosophical consideration of the laws of the natural world. While engaged as an apothecary in 1800, Oersted made some discoveries in galvanic electricity. In 1801 he travelled in Holland, Germany, and France, and on his return in 1803 lectured at Copenhagen on electricity and kindred sciences. In 1806 he was made professor of natural philosophy, and his lectures attracted much attention. His thoughts had long been directed towards the identity of electricity and magnetism. In 1812, while in Germany, he published a treatise tending to that conclusion, and at last, in 1819, he succeeded in proving the fact. This great discovery gave him a foremost place among the scientific men of his time, and foreign societies bestowed on him numerous marks of honor. His labors to popularize science among his countrymen resulted in the establishment of a polytechnic school at Copenhagen, of which he was director from 1829.

He also founded the Magnetic Observatory of Copenhagen. In 1850 the fiftieth anniversary of his doctorate was celebrated with a national jubilee. He died at Copenhagen, March 9, 1851. His most important works were a *Manual of Mechanical Physics* (1809; 2d ed., 1844); and *The Soul in Nature* (1806; English translation, 1852).

His brother, ANDERS SANDOE OERSTED (1778-1860), was an eminent jurist, and in 1853 became prime minister of Denmark, but was driven from power in 1854 and impeached for violation of the constitution, but finally acquitted. He was the author of some philosophical works.

OFFICE, as a legal term, denotes a right and correspondent duty to exercise a public or private trust or employment, and to take the fees and emoluments belonging to it. Offices may be variously classified. *Judicial* offices are those which relate to the administration of justice. *Military* offices are such as are held by soldiers and sailors for military purposes. *Ministerial* offices are those which give the officer no power to judge of the matter to be done, and require him to obey the mandates of a superior. *Political* offices are such as are not connected immediately with the administration of justice or the execution of the mandates of a superior officer: *e. g.*, those of President of the United States, members of Congress, etc.

In England some offices may be granted to a man in fee, or for life, as well as for years and at will. In the United States the Constitution or laws of the State provide for the duration of the office, which is never more permanent than during good behavior. Offices in England are either public, which affect the people generally, *e. g.*, magistrates; or private, which concern particular districts belonging to private individuals, *e. g.*, bailiffs. In the United States all offices are deemed public, though those of presidents of banks and directors of corporations are in the nature of private offices. The statutes of 5 and 6 Edw. VI. c. 15 made the buying and selling of offices a misdemeanor, to be punished also with the loss of the office. Its provisions have been enacted by several of the United States; its object being to prevent corruption in office, it does not apply to the fair and necessary appointments of deputies with a reasonable allowance. If the salary be fixed, a deputation of the office, reserving a sum less than the salary, is not illegal; so if the emoluments be uncertain, the deputy may agree to pay over a proportion of what he receives. If, however, the fees are uncertain, and the deputy agrees to pay a certain fixed sum, without restricting it to the amount received by him, it is a sale within the statute. It has been decided by the federal courts, as well as by those of several of the States, that an agreement by an applicant for office to divide the fees with another applicant if he will withdraw and aid the former to obtain it is void. A judicial office must be exercised by a person of skill and experience in the duties pertaining thereto; it must also be exercised in person, as a judge cannot delegate his authority to another.

Under the Constitution of the United States, Art. VI., § 2, no Senator or Representative can hold office under the United States during his term. By accepting such an office he forfeits his seat.

By an act passed during the administration of Pres. Monroe and still in force, the term of office of U. S. collectors and other executive officers, including certain grades of postmasters, is for four years, though they may be removed sooner by the President. During the political struggle between Pres. Johnson and the Republican majority of Congress, an act was passed on March 2, 1867, providing that every person holding any civil office to which he had been appointed by and with the advice and consent of the Senate should be entitled to hold such office until a successor should in like manner have been appointed and duly qualified. It also prescribed that while the President might remove or suspend an officer for cause, yet the

Senate should be judge of the cause and have power to reinstate the officer independently of the President, and that officers appointed by the President during the recess of the Senate should draw no salary until the Senate had given its consent. This act also provided that the secretaries of state, of the treasury, of war, of the navy, and of the interior, the postmaster-general and the attorney-general, should hold their respective offices during the term of the President by whom they have been appointed and for one month thereafter. This Tenure of Office Act was vetoed by Pres. Johnson in an able message, but the bill was passed over the veto by a vote of 35 to 11 in the Senate and of 133 to 37 in the House of Representatives. Pres. Johnson's attempt to remove E. M. Stanton from his office as secretary of war in 1868 led to his impeachment, a movement which failed through its inability to secure the necessary two-thirds vote in the Senate.

When Pres. Grant took office on March 4, 1869, he found the discharge of his duties greatly hampered by this act, and on March 9th Gen. B. F. Butler introduced a bill in the House of Representatives repealing this act. The repeal passed the House by a vote of 138 to 16, but the Senate proposed a substitute by which the President was allowed to suspend any officer without showing a cause and to nominate a successor. Nominations could be made until the Senate should confirm, but in the failure of the Senate to confirm the suspended officer would be restored. Owing to the difference between the two Houses the modification of the act was all that could then be obtained. Its repeal was asked for in later years by Pres. Grant, Hayes, Garfield, and Arthur, on the ground that it obstructed the faithful and efficient administration of the government, but the modified act remained in force until 1886.

The President has now freedom to exercise that salutary constitutional authority over appointments and removals which had been the uniform rule since the formation of this government until 1867. This extensive grant of power to the executive had been carefully considered by the framers of the Constitution and deliberately adopted by them, and it has since had the approval of Chief-Justice Marshall and other eminent expounders of constitutional law. (T. R.)

OGDEN CITY, the county-seat of Weber co., Utah, is at the confluence of the Weber and Ogden Rivers, 37 miles N. of Salt Lake City. It is the terminus of the Union Pacific, the Central Pacific, the Utah Central, the Denver and Rio Grande (narrow gauge), and the Utah and Northern Railroads. For these roads a union passenger depot is provided. The Weber River here passes through the Wahsatch Mountains, and the city is at an elevation of 4340 ft. Ogden Cañon is 7 miles long, with a total fall of 450 feet, thus affording good water-power. There are two bridges over the Weber and one over the Ogden River. Ogden has 5 hotels, 3 national banks, 1 semi-weekly and 2 daily newspapers, 6 churches besides the Mormon tabernacle and ward meeting-houses. The six public schools are controlled by the Mormons, but each denomination has a school of its own. The industries comprise an iron-foundry, flour-, saw-, and planing-mills, two breweries, and factories producing brooms, boots and shoes, woollen goods, and vinegar. In Ogden cañon there are large powder-works and also the plant of the electric light for the city. The streets are wide and well kept, the business blocks substantially built. Ogden has a park-square, water-works, and gas-works. Its property is assessed at \$2,158,000, which is half the true value. The city's debt is \$21,000, its yearly expenses are \$41,000, and its revenue is still greater. It was settled in 1848 by Mormon agriculturists and incorporated in 1859. Its population in 1880 was 6069, but it has since greatly increased.

OGDENSBURG, a city of New York, in St. Lawrence co., is on the St. Lawrence River, at the mouth

of the Oswegatchie. It is the terminus of three railroads, and has also steamboat lines. Its principal edifices are the Roman Catholic cathedral, the U. S. government building, and the Seymour hotel. It has a national bank, 8 churches, graded schools, 1 daily and three weekly newspapers, a large grain-elevator, flour- and lumber-mills, and leather-factories. The village, founded by French missionaries, did not receive its present name until 1817, when it was incorporated. It was made a city in 1868. Its population in 1880 was 10,341.

OHIO is, by the census of 1880, the third of the United States in population and wealth. See Vol. XVII. It was the first State created from the p. 734 (p. 754 North-west Territory. There is some Am. Rep.). conflict among authorities as to the date of its admission to the Union, that generally given being February 19, 1803, while others maintain that Ohio became one of the States of the Union in 1802.

In 1802 it was decided that the territory now comprised in the State of Ohio had a population sufficient to warrant the petitioning of Congress for its admission as a State. Congress passed a bill, approved by the President on April 30, 1802, authorizing the inhabitants of this Territory to form a constitution and

State government under such name as they deemed proper, said State to be admitted to the Union on the same footing as the original States. This act also authorized all male citizens, residents in the Territory, of certain prescribed qualifications, to choose representatives to form a convention which was to convene at Chillicothe on the 1st Monday in November, 1802, and determine whether it was expedient to form a constitution and government, and if so, to form them, but if not, to provide for calling a second convention for that purpose. The act also provided that until the next census the new State should be entitled to one member in the House of Representatives. Neither Legislature or convention nor even the people were asked to pass upon the question of entering into a State government, the sole function of the electors being to vote for the members of the convention as prescribed by Congress. The convention assembled in the following November, and before its adjournment, on Nov. 29, framed a constitution. The following winter Congress passed an act entitled "An act to provide for the execution of the laws of the United States within the State of Ohio," which was approved by the President on Feb. 19, 1803. There has been considerable discussion as to which of the three dates can be properly given as that of the admission of Ohio as a State. Some claim that April 30, 1802, the date of the enabling act, was the date of admission; others that Nov. 29, 1802, the date of the adjournment of the Constitutional Convention, was the date, while the majority of those considered authority declare that the date of the approval of the act providing for the execution of the laws of the United States within the State of Ohio, Feb. 19, 1803, is the proper date of admission. The fact is that Ohio was never in set terms admitted to the Union, although the act of Feb. 19, 1803, after giving the history of what had preceded in the organization of the State, says: "Whereby the said State has become one of the United States of America."

Ohio is situated between 38° 27' and 41° 57' N. lat. and between 80° 34' and 84° 49' W. long. Its area is 40,760 square miles. The greatest length of Ohio from north to south is about 210 miles, and the greatest breadth from east to west about 225 miles. The native as well as the foreign-born population of Ohio has increased rapidly since the census of 1880. There

were in 1887 in the State 69,073 births and 29,180 marriages. The number of deaths was 30,818. There were naturalized in 1887 in the State 5729 voters. Of these 3188 were natives of Germany, 601 natives of Ireland, and 288 natives of Austria.

Physical Features.—Since the year 1884 a new chapter has to be added to what was then stated regarding the physical features and resources of Ohio. The natural resources of the State are now known to include a bountiful supply of the combustible fluid known as natural gas. Since the town of Findlay, Hancock co., in the north-western part of the State, was first settled natural gas was known to exist there in small quantities. The spring-water was charged with sulphuretted hydrogen, and in 1836 a vein of gas was struck at a depth of ten feet in excavating for a well. Although this readily ignited, no thought of using it for economic purposes resulted in any further search for the gas until, in March, 1884, a company was organized at Findlay to bore for natural gas. In the first successful well gas was found in large quantities at a depth of 1092 feet below the surface, flowing in a volume of from 200,000 to 300,000 cubic feet a day. The record of the drilling of this well is given as follows:

Drift.....	8 ft.
Upper limestones.....	237 "
Shales, red, gray, and brown.....	847 "
Lower limestone or gas rock.....	1092 "

This was the first discovery of the fact that gas was stored in the Trenton limestone beneath Findlay in sufficient quantities to be of great value as fuel for manufacturing and domestic use. This was rapidly followed by the sinking of other wells, one after another proving successful, and a sufficient supply of gas soon being tapped to furnish fuel for the houses and factories of a metropolis.

The excitement attendant was similar to that on the discovery of petroleum in Western Pennsylvania. Real estate advanced in value, new manufacturing were projected, and in a few years the population of Findlay increased from 5000 to nearly 20,000. The Findlay gas-field extends a dozen miles north and east of the city.

But the Ohio supply of natural gas is by no means confined to the Findlay field. Bowling Green, Carey, and many of the other towns in the same part of the State were nearly as successful as Findlay in drilling for the natural gas, the history of Findlay being substantially that also of other towns in North-western Ohio. In other parts of the State, in fact in every part of it, wells have since been drilled with more or less success. In North-western and Western Ohio success has, as a rule, attended these efforts. In Central Ohio Lancaster obtained a good supply of gas. A system of piping the gas to cities, whose efforts to secure it by drilling have been unsuccessful, has been inaugurated.

The great merit of the natural gas as a fuel is its cheapness and high quality as a heat-yielding combustible. In localities where it is present it has superseded coal, as the cost of obtaining it after the first drilling and piping is almost inappreciable, and it can be furnished to consumers at a very slight expense. Supposed at first to be stored in the Trenton limestone, it has since been found in the Clinton limestone, and at some points in Berea grit.

The specific gravity of the Ohio natural gas is .566. The depth at which it is found beneath the surface varies in different fields, the successful wells in the Findlay fields varying from 1100 to 1650 feet in depth. The strongest wells obtain their gas in Trenton limestone. At Cleveland the natural gas was obtained after drilling over 1800 feet. Scientists differ as to the likelihood of the supply becoming exhausted, but Ohio wells from which gas has been burned in quantities for

two or four years still flow with unabated pressure. Its discovery has given a new impetus to manufacturing industries in Ohio.

At Lima, Allen co., drilling for natural gas in the spring of 1885 resulted in developing new oil-fields, petroleum coming from the Trenton limestone in large quantities. This was the opening of the development of the Lima oil-field, which has since proved very productive.

Agriculture.—There are at least two-fifths of the persons engaged in any occupation employed in agriculture, the leading industry of Ohio. There are about 10,000,000 acres cultivated, and in 1886 nearly 40,000,000 bushels of wheat, 90,000,000 bushels of corn, and in the neighborhood of 190,000,000 bushels of all cereals were produced in the State. The average production of wheat for the last five years has been 11.86 bushels per acre, and of corn 33.8 bushels per acre. The products of orchards and dairies are also prolific. The annual production of wool in 1886 and 1887, though slightly less than in preceding years, was about 20,000,000 pounds, Ohio holding the first rank in the wool-producing States. The number of sheep in 1887 was 4,105,177, and in 1888 was 3,739,449. In 1888 the number of horses was 786,549; cattle, 1,612,726; mules, 25,189; hogs, 1,629,616. Ohio ranks next to Illinois in thoroughbred cattle, and is one of the largest pork-producing States. Agricultural implement manufactures in this State turn out one-fourth the annual product of the United States.

Manufactures.—Ohio is one of the leading States in the number of manufacturing, the amount of annual manufactured product, and number of men employed in manufacturing industries. The manufacturing concerns of the State include nearly every form of industrial enterprise, from rolling-mills to glass-factories. In Cleveland are located many large rolling-mills and iron-factories, the immense works of the Standard Oil Company employing three thousand men, with a capital of millions invested, and numerous other large factories of different kinds. In Akron, Canton, and Springfield are large agricultural machine and implement concerns, also employing thousands of men. This State furnishes at least one-fourth of the agricultural implements of the country. In Findlay, in the north-west, in East Liverpool, and in other portions of the eastern part of the State are large glass-factories, the latter region being also the seat of many large potteries. Columbus has immense carriage-factories, rolling-mills, and agricultural implement works. Cincinnati has many large manufacturing concerns of different kinds, besides being one of the leading cities of the country in the pork-packing industry. There are over 7000 industrial establishments in Ohio, employing 200,000 men and 30,000 women, with a capital of over \$200,000,000. The value of the annual product of these manufactures is \$400,000,000. Statistics show that the number of weeks in which these manufacturing are in operation during the year averages 47.

Railroads.—Ohio is covered with a net-work of railways, all the principal towns and cities in the State being now on the lines of railroads and all the eighty-eight counties being crossed and recrossed by railroad lines. In the twelve years between 1876 and 1888 4000 miles of new railroad track were laid in the State. Ohio has now over 10,000 miles of railroad. In 1887 there were reported to the State Board of Railroad Equalization 7365.65 miles of main track and 1968.06 miles of sidings, which were valued for taxation at \$93,869,782.

Several trunk-lines cross the State from east to west and now have branches extending into nearly all parts of the State.

There are also several roads traversing the State from north to south, and these, with the shorter tributary roads constructed and under process of construction, enable Ohio people and the products of

Ohio farms and factories to readily reach all the cities of the country, the seaboard, and the markets of the world by almost direct routes. New lines are constantly being projected. The sworn reports of railroad officials to the railroad commissioner for 1887 show that for the year the gross passenger earnings of roads, all or part of which are in Ohio, were \$25,495,598.31; gross freight earnings, \$78,889,473.27; total gross earnings, \$112,546,743.19. The proportion of these gross earnings for the part of the lines in Ohio was \$56,785,652.86, an increase of 12.93 per cent. over the preceding year. The net earnings for the entire lines were \$37,270,852.90, the proportion of net earnings for Ohio being \$18,795,072.94, this being an increase of 30.69 per cent. over the preceding year for the portion of the lines in Ohio. The interest on bonds, etc., was \$15,188,403.38; dividends, \$6,481,398.19, and the rentals about \$3,000,000. The paid-in capital stock of the lines was over \$500,000,000, of which \$45,000,000 was held by 16,500 residents of Ohio. The bonded debt of the roads was over \$400,000,000, the proportion for Ohio being \$221,000,000. The unfunded debt was \$51,000,000, the proportion for Ohio being \$25,000,000. The number of passengers carried in 1887 was nearly 35,000,000, and the number of tons of freight hauled was over 85,000,000. The average freight rate per ton per mile in Ohio in 1886 was .658; in 1887, .707. The average passenger rate per mile in Ohio in 1887 was 2.179 cents. The law of Ohio makes three cents per mile per passenger the maximum passenger rate and five cents per ton per mile the maximum freight rate for distances over thirty miles. The proportion of accidents to persons travelling on railroads in Ohio, in 1887, was one passenger killed to 106,767 carried, and one passenger injured to 42,813 carried. An idea of the products of the State, as well as the business of the railroads, can be gained from the following classified freight tonnage carried by railroads in Ohio in 1887:

Freight Tonnage (Classified).

	Tons.
Agricultural products, etc.	3,393,739
Coal	27,771,677
Flour	1,856,744
Grain	9,242,207
Ores	5,176,201
Pig and bloom iron	3,183,770
Iron, steel, and castings	4,272,878
Manufactures	5,737,985
Stone, lime, brick, tile, and sand	4,594,278
Live-stock	2,614,452
Lumber, timber, shingles, lath, and other forest products	6,854,247
Petroleum—crude and refined	1,287,325
Salt	265,785
Bran and mill feed	497,855
Merchandise	4,824,342
Miscellaneous	3,703,977
Total tonnage yielding revenue	85,277,462

[It should, perhaps, be explained that in giving the amount of earnings and other statistics for roads in Ohio the whole amount for the whole line of roads crossing or entering the State is given, as separate accounts are not kept for these roads for the portion of the line in the State. The proportion for Ohio in each case is, however, estimated and stated in the above statistics.]

Government and Administration.—The legislative power is vested in the General Assembly, consisting of a Senate and House of Representatives, the members of which are elected biennially. The judiciary department consists of a Supreme Court, consisting of five judges elected for five years each, Circuit Courts, Common Pleas Courts, Probate Courts, Police Courts, and Justices of the Peace. The Circuit Courts were established by a constitutional amendment adopted in 1885. There are eight circuits in the State, each of which

Vol. IV.—F.

has three judges elected by the voters residing within the circuit. The supreme executive power is vested in the governor, who is commander-in-chief of the militia and at the head of the civil government. He is elected biennially and paid a salary of \$8000 a year. The lieutenant-governor, who is president of the Senate, with an annual salary of \$800; a secretary of state, annual salary \$2000, with \$1000 additional as fees; a State treasurer, annual salary \$2000, and attorney-general, annual salary \$1500, with \$500 additional as fees, are also elected biennially. The auditor of state, with an annual salary of \$3000, is elected for four years. Three members of the board of public works, each elected for a three-year term at a salary of \$800, and expenses, have charge of the public works. A State commissioner of common schools, with a salary of \$2000, is elected triennially; a clerk of the Supreme Court, with a salary of \$1500, and \$500 additional as fees, is also elected triennially. These with the five supreme judges are all the elective State officers. There are appointed by the governor, with the advice and consent of the Senate, a commissioner of railroads and telegraphs for two years; a State librarian for two years; a superintendent of insurance for three years; an inspector of mines for four years, and an inspector of shops and factories for four years; a commissioner of statistics of labor for two years; a supervisor of public printing for two years; a State inspector of oils for two years; three commissioners of fisheries for three years; a swamp land commissioner for an indefinite term; a dairy and food inspector; an inspector of leaf tobacco, and a number of minor officials in the executive department.

There is a State board of health, members of which are appointed by the governor. This board has general supervision of local boards of health, compiles vital statistics and adopts measures to prevent the spread of infectious diseases. There is also a State board of pharmacy consisting of five members, which was created in 1884. No person can compound prescriptions or keep a drug-store without first having been given a certificate by this board. All the pharmacists and assistant pharmacists in the State are registered. The duty of the board of pharmacy, in addition to examining applicants for certificates, is to prosecute all cases of violations of the law, which prohibits unauthorized persons dealing in drugs and medicines.

The governor also appoints a board of pardons of four members, two from each of the two leading political parties, and a State board of charities, consisting of eight members, four from each of the leading political parties, who investigate the system of public charities and the penal institutions of the State. The governor also appoints non-partisan boards of election of four members for each of the larger cities, to regulate the registration of voters and all elections held in these cities and appoint judges and clerks of election. Judges of all the courts, including justices of the peace and police judges in the larger cities, are elected by the people, as are also all clerks of courts. All county officers are elected by the people. The State is divided into two districts, a northern and a southern, in each of which is a United States court, district judge, clerk, and marshal. All elections are by ballot and every sane male citizen twenty-one years old and a resident of the State for one year next preceding the election may vote. Institutions for the care of the insane, deaf and dumb, imbecile, blind, veteran soldiers and sailors of the late war, and soldiers' and sailors' orphans, are maintained and supported by the State. The State penitentiary is located at Columbus, the capital of the State, and provision is made in it for the imprisonment of from 1500 to 2000 convicts. The death-penalty for murder is carried into effect within the walls of the penitentiary—condemned murderers, after being sentenced by the courts in the counties where the crime is committed, being removed to the penitentiary for execu-

tion. An intermediate penitentiary for the imprisonment of first offenders is being built at Mansfield.

Ohio is represented in Congress by two senators and twenty-one representatives. The county officers in each county are three commissioners, who have charge of the county property, fix county taxes, regulate roads, and have general supervision of all county matters. Three infirmity directors, an auditor, a recorder, a surveyor, a clerk of the Court of Common Pleas, who is also clerk of the Circuit Court, a treasurer, a sheriff, a coroner, and a prosecuting attorney, are all elected for three years except the treasurer, sheriff, coroner, and prosecuting attorney, who are each elected for two years. A county which contains a city of over 180,000 population has a board of control of five members, each elected for three years, which has final action and jurisdiction in all matters involving expenditures of money. Each county must contain at least 400 square miles of territory and the Legislature has power to lay out new counties. Counties are subdivided into townships, each of which must contain at least 22 square miles. County commissioners have power to lay out new townships. Township officers are three trustees, a clerk, a treasurer, constables, and an assessor. Township trustees have the oversight of elections in the country precincts, provide for the repairing of roads, afford relief to the poor, and have general charge of all township matters.

Education.—The receipts for school purposes in 1887 were \$1,761,725.46. The number of pupils enrolled in the common schools of the State were 767,030. The total number of youth of school age in the State were 1,102,721. The amount paid to the 88 counties for school purposes from the State treasury was \$1,707,104.90. The total expenses of the common schools for 1887, as reported by the school commissioner, were \$9,909,813.12.

Among the higher educational institutions of Ohio there has been progress and development in the past few years. One of them, Western Reserve College, formerly located at Hudson, has been removed to Cleveland, and its name changed to the Western Reserve University. With a large endowment and new buildings on Euclid avenue, the former town college has become a university, with a number of different departments. Strictly speaking, what was formerly Western Reserve College is now Adelbert College of the Western Reserve University, with which is joined the Case School of applied science. A female college is projected as part of the same, the system of co-education in Adelbert College having been dropped in 1888.

Finance.—The receipts of the Ohio treasury for 1887 were \$6,512,089.77; the disbursements were \$6,289,811.04; the funded State debt on Nov. 15, 1887, amounted to \$3,341,665, bearing interest at 3 and 4 per cent.

The value of realty in Ohio for 1887 was \$1,185,010,625; of personal property, \$520,172,094. The State taxes amounted to \$4,942,447.23; the total taxes, State, county, township, and municipal, were \$34,565,285.89.

The irreducible State debt (trust funds) was \$4,526,716.65, making the total State debt \$7,943,181.65. The debts of counties amounted to \$6,892,745.26; of cities of the first and second class, \$43,193,963.34; of incorporated villages, \$1,743,772.98; of townships, \$557,883.71; of special school districts, \$2,455,330.71, making the total local debts \$54,843,696. While the State debt is steadily decreasing and has been refunded at low rates of interest, the local indebtedness is increasing at the rate of about a million dollars a year, this resulting from local improvements, payment for which is made by the issuance of bonds by authority of the Legislature. Under the laws of Ohio, counties and cities can create local bonded indebtedness by securing permission from the Legislature.

(J. M. D.)

OILS. The oils known to commerce may be grouped under three general heads: animal and fish oils, vegetable oils, and essential oils. The first group, at one time by far the more important, has suffered in commercial importance by the inroads made in their use by the products of petroleum, the more important of the animal and fish oils before the advent of petroleum being the principal reliances for lubrication and illumination. The second group has been little affected by the discovery of petroleum, but oils that were only a few years ago unknown have come to the front, the most prominent example being cottonseed oil, now the most important of the seed oils. The list of distinctively American essential oils is a short one, although it contains one vying in importance with some of the more prominent essential oils of the old world—oil of peppermint. The oils manufactured in the United States are considered by groups as above.

ANIMAL AND FISH OILS.

Cod and Cod-Liver Oils.—The oil from livers of codfish is mostly imported from Newfoundland and from Norway. The amount manufactured by the fishermen is insignificant, and rarely enters the market in competition with the imported oils. The oil commercially known as cod oil is expressed from the heads, livers, and other waste portions of the fish. It is not a medicinal oil, but is used by curriers, and commands a ready sale at about one-half the price realized for the oils made from cod livers only. The annual production varies greatly, but may be said to average from 20,000 to 25,000 barrels.

Lard Oil.—The manufacture of lard oil in the United States has suffered less by reason of the substitution of the products of petroleum than have the whale- or sperm-oil industries. It is still used as a lubricant and burning oil where absolute safety is demanded, and is largely employed in compounding lubricating oils. Chicago is the centre of the lard-oil industry.

Menhaden Oil.—The menhaden-oil industry is of comparatively recent origin, having its beginning in 1850. In that year Mrs. John Bartlett, of Blue Hill, Me., while boiling some fish for her chickens noticed considerable oil on the surface of the water, which she collected in bottles and carried to an oil-merchant in Boston, Mass., who at once pronounced the oil valuable. The Bartlett family being encouraged to produce the oil in quantity, in 1851 sent to market 13 barrels of the oil from the "bony fish," or "mossbunkers," as the fish are popularly called in different sections along the New England coast. The first to sell the oil was Mr. E. B. Phillips, an oil-merchant of Boston. The mode of extracting the oil was most primitive, the fish being simply placed in large kettles with water, allowed to boil, and the oil skimmed off as it collected on the surface. From this small beginning the business grew rapidly, reaching its highest development in the year 1882. In this year the amount of capital employed in the business of catching the fish and rendering the oil was \$2,858,500. The number of factories in operation and firms engaged in the business was 97; there were 83 steam- and 212 sailing-vessels employed in taking the fish, while employment was furnished 2313 men. The number of fish caught was 346,638,500, and the amount of oil produced 2,021,312 gallons. From this year dates the decadence of the industry, although during the season of 1884, which begins in April and ends in October, the number of fish caught reached the enormous total of 858,592,700, and the amount of oil produced 3,722,927 gallons. In that year the number of factories in operation was 52, the number of steam-vessels engaged 59, and 157 sailing-vessels. Since then the decline of the industry has been more rapid, the statistics for 1887 being: amount of capital invested, \$1,000,000; number of factories in operation, 28; steam-vessels, 46; sailing-vessels, 38;

men employed, 1233; fish caught, 333,564,800; oil produced, 2,273,566 gallons. The decadence of the industry is due to the use of cheaper substitutes, principally products of petroleum. The principal use made of the oil is by tanners. It is also used in the safety-lamps of miners and to a limited extent in mixed paints. The fish appear in large schools along the coast, the southern limit of their appearance being off the coast of Virginia and their northern limit the coast of Maine, although during the past six years very few fish have been taken north of Cape Cod. The favorite resort of the menhaden is from Narragansett Bay along Long Island Sound, south to the Delaware capes. The oil made from the fish taken in these waters is superior to that made from fish taken farther south.

Neatsfoot Oil.—It is claimed that no perfect substitute for this oil has been found, and the use, although limited, shows little variation. It is largely adulterated, and has suffered in repute in consequence.

Porpoise Oil.—This oil is esteemed for lubricating fine machinery, but the demand therefor is limited. The oil is made at New Bedford, which is the only market where supplies are kept on hand. Vessels have been fitted out for the purpose of catching the porpoise along the coasts of New Jersey, Long Island, and the New England States, but the venture proved unprofitable.

Seal Oil.—The manufacture of seal oil is limited, and the demand therefor being small, there is an uncertain supply. Very little of the oil sold under the name is genuine seal oil.

Sperm and Whale Oils.—The introduction of the products of petroleum for all the uses for which sperm and whale oils were in former years exclusively employed has greatly diminished the use of these oils. The whale-oil industry from being one of the most important has dwindled to insignificant proportions. Since 1860 the decline of the industry has been steady and rapid. In that year the catch of sperm whales produced 73,708 barrels of oil, and of right whales 140,005 barrels of whale oil. The number of vessels engaged in taking the whale was 589, with an aggregate tonnage of 176,842 tons. In 1887 the amount of sperm oil produced was 18,873 barrels, and of whale oil 34,171 barrels. The total number of vessels of all classes engaged in the fishery was 116, having an aggregate tonnage of 27,851 tons. The city of New Bedford, Mass., is still the most important whaling port. New London, Conn., from ranking second in importance is at the bottom of the list, while Stonington, Conn., at one time having a larger amount of tonnage engaged in the industry than does New Bedford at the present time, has abandoned the business entirely, as has also Mystic, Conn., once an important whaling port. San Francisco now ranks second, with a fleet of 21 vessels, with a total of 6480 tons.

Tallow Oil.—The use of tallow oil has decreased, and its production is restricted to the demand. Substitutes of lower cost have supplanted this oil for nearly all purposes for which it was formerly exclusively employed.

VEGETABLE OILS.

Castor Oil.—This oil was formerly imported from Calcutta and London, but since 1875 the production in the United States has, except in years of small crop of seed, been sufficient to meet all demands. There are, however, importations each year from Calcutta, which tend to keep the price of the domestic oil from advancing beyond a certain limit. Five manufacturing firms produce nearly all the oil used in this country, and these working in harmony control the price. Improved methods of expressing the oil have been adopted, by which the yield is fully 30 per cent. of oil, whereas formerly 25 per cent. was regarded a good yield. Two qualities are made, although there is very little demand except for the best, other oils being preferred for lubricating purposes.

Corn or Maize Oil.—The manufacture of corn oil is of very recent origin, and is a distinctive American industry. In the manufacture of starch it is found desirable to get rid of the germ of the corn, and this was formerly a by-product for which no profitable use could be found, the germs being too rich in oil as a food for cattle, nearly or quite all the oil being in the germ. The germs as collected from the factories are first purified by separating them from the bran or husk of corn that adheres to them, and are then steamed under pressure to soften them, after which by means of hydraulic presses the oil is expressed, leaving as a residue an oil-cake, which, when ground into meal, is a valuable feed for stock, equal to corn-meal made from the whole corn. The color of the freshly made oil is a pale yellowish-brown, and its odor and taste that of freshly ground corn-meal. It does not readily become rancid by exposure to air, and in this respect compares favorably with the best olive oils. The unrefined oil has a specific gravity of 0.916 and 0.917 at 15° C., which is about that of pure olive oil. It saponifies rapidly with caustic alkalies, forming a white soap, and for the manufacture of the finer qualities of toilet-soaps it is found to equal the best olive oil. The supply can be increased to meet any demand likely to arise, and the price is about the same as the current market price of cottonseed oil. An analysis made by an eminent English chemist gave:

Fatty acids (free).....	0.88
Total fatty acids.....	96.70
Unsaponifiable, mucilaginous, and albuminous bodies.....	1.34

Cottonseed Oil.—See COTTON, chap. v.

Linseed or Flaxseed Oil.—Although many substitutes have been tried, linseed oil remains the most satisfactory in the mixing of paints and for the manufacture of varnishes and oil-cloths. The consumption in the United States is fully 25,000,000 gallons per annum, and the average increase is about 10 per cent. The number of mills in operation is 65, fully four-fifths being located in the Western States, with Chicago as the centre of the industry. The capacity of the mills is over 40,000,000 gallons, and owing to over-production the business has not been so profitable as formerly. Domestic seed is exclusively used at the Western mills, while the Eastern mills, notably those located in the city of New York and vicinity, use Calcutta seed when the domestic seed ranges high in price.

Mustard Oil.—Of the two oils contained in mustard seeds the volatile oil is not produced on a commercial scale in the United States, nor is it much used, other rubefacients being preferred. The expressed fixed oil has a moderate sale, being used as an adulterant in salad oils, although the oil expressed from cotton-seed has of late years supplanted mustard oil for this purpose. The quantity produced in this country is not important.

Peanut Oil.—Peanuts contain more than 20 per cent. of a fixed oil which was formerly an important article of commerce, but the low price of cottonseed oil has made the expression of ground-nut oil unprofitable, the nuts being of greater market value as an article of food. The oil has a bright yellow color and a mild taste, with the characteristic odor of the fruit. Its specific gravity is 0.918 at 15.5° C. It is a non-drying oil unsuited for paints, but is a good burning oil, equal to the best sperm oil.

ESSENTIAL OILS.

Peppermint Oil.—The herb from which the oil of peppermint is distilled (*mentha piperita*) is grown in Wayne co., N. Y., and in sections of the State of Michigan. The herb is distilled by the growers in primitive stills and sold to dealers, although some sell the herbs to those who make a business of distilling

the oil in improved apparatus. The oil is variable in quality and the yield of the herb uncertain, in some years proving unprofitable. The value of the exports of this oil exceeds that of all the other essential oils produced in the United States. The principal market for this oil is New York.

Sassafras Oil is the least important of the essential oils that may be called American, both as to the value of the oil and the quantity produced. Maryland, Virginia, Delaware, and West Virginia are the principal sources of supply. As this is the cheapest of the essential oils it is largely used in the arts, and was the most common scent for soap until supplanted by myrbane oil. As distilled from the fresh roots the yield is about 2 per cent. The dried bark is said to yield 5 per cent. of oil.

Wintergreen Oil.—The oil known in commerce as wintergreen oil is not made from the plant of that name, although such was the case in former years. It is a product of the distillation of the bark of the sweet birch, which is more abundant and richer in oil. The properties of the oil from both sources are identical. The principal sources of supply are the States of New Jersey, New York, and Pennsylvania, where it is distilled in a primitive manner and sent to market or sold to dealers who collect it. The supply is always equal to the demand. (H. G. A.)

OJIBWAYS, or CHIPPEWAS, a tribe of American Indians of the Algonkin stock, have been known since 1640, when the French first explored the western shores of Lake Huron. A mission was founded at the Sault Ste. Marie by the Jesuit Fathers Jogues and Raymbault in 1642, and hence the Ojibways have become known in Canada as the Sautaux. They are hardy, strong, and devoted to war and hunting. They drove the Sioux beyond the Mississippi, and during the French domination they rendered effective assistance in raids on the British settlements. They joined in the conspiracy of Pontiac and surprised the fort at Mackinaw in 1763. Brought under British influence they threatened the American border settlements during the revolutionary war, and at its close gave much trouble in Ohio. They were defeated by Gen. Wayne and made a treaty at Greenville, Aug. 3, 1795. They were then scattered along the southern shores of the Great Lakes, from Erie to the head waters of the Mississippi. In the war of 1812 they joined Tecumseh in aiding the British, but in 1816 they again made a treaty of peace, and soon after abandoned their lands in Ohio. They were then reckoned at 14,000, and in 1825 the limits of their territory were defined by treaty, but these have since been greatly reduced.

The Ojibways who remained in the reservations in Upper Michigan and Wisconsin became peaceful and industrious and responded well to missionary efforts. Besides the Roman Catholic missions, which are still maintained to some extent, the Episcopalians, Presbyterians, and Methodists have shared in this work. In 1887 there were reported 4042 Chippewas in Wisconsin, who were doing moderately well at farming and logging. Those in Michigan had given up tribal relations, many of them exercise the right of suffrage, and they are sometime elected to local offices. Those not on reservations are exposed to frauds from the whites, and the education of their children is neglected. Those Ojibways who removed to Minnesota long retained their old habits and many have become degraded under the influence of vicious whites. In 1887 there were reported at Turtle Mountain agency, Dakota, 1126 persons, of whom 309 were full-blood Chippewas, the rest of mixed blood. They are Catholics and are dependent on the government for support. This reservation contained 46,080 acres, divided into timber, farming, and grazing lands. Beyond its limits there were many others living among the whites and on equal terms. To the labors of the missionaries is due our knowledge of the language and customs of the Ojibways or Chippewas. H. R. Schoolcraft did much

to popularize it. Two members of the tribe have published histories of the Ojibways, George Copway (Boston, 1851) and Peter Jones (London, 1861).

OKRA (*Hibiscus esculentus*) is a species of the *Malvaceæ* or Mallow family, mucilaginous plants which are found throughout the tropical and temperate parts of the earth. The okra, in the opinion of some, is a native of the East Indies, though De Candolle thinks that its name points to an origin in tropical America. It is an annual, generally resembling the mallows, with a stem 2 to 6 ft. high, and rigid, 5-lobed leaves, in whose axils grow large, yellowish flowers with purplish centres. The fruit is a narrow, 10-angled pod, 4 to 8 inches long, of pyramidal shape, with pointed extremity. It contains numerous kidney-shaped seeds. The plant is cultivated for its pods, which when young contain mucilage in abundance. They are gathered while still tender, and before any woody fibre appears, and are used as a thickening material for the peculiar Southern soup called gumbo. They are also sometimes boiled and dressed like asparagus. The pods are salted for winter use, or sliced and dried. The inner bark of the okra yields an excellent fibre, and has been proposed as suitable for paper stock.

OLAF, SAINT (c. 995–1030), king and patron saint of Norway, was a son of Harold Gränske, and grandson of Harold the Fair-haired. When only 12 years old he led a Viking fleet to the coasts of Britain, and afterwards plundered the coasts of Sweden, France, and Spain. Having become one of the most dreaded sea-kings, he returned to Norway in 1014, and made himself master of the kingdom, and introduced Christianity. He burned the heathen temples and used such violence that a rebellion was excited. In 1028 Canute came with an army to enforce his claim to Norway and Olaf fled to Russia. After two years he returned with aid from Sweden, and was defeated and killed near Drontheim, July 29, 1030. When Christianity was fully established his body was enshrined in the Cathedral of Drontheim, and Olaf was made the patron saint of the country. In 1847 King Oscar I. instituted the order of St. Olaf.

OLEOMARGARINE. The making of artificial butter has become of late years an industry of such importance that some account of its origin and growth is here requisite. It originated in the desire of the French government to provide the poorer classes with a cheap substitute for butter. They employed M. Mège-Mouriès to make experiments with this object in view. Presuming that beef fat might contain the constituents of butter, he experimented with suet, which he found to be below butter in its proportion of oleine. By extracting a portion of palmitine and stearine from the fat, he brought its proportion of oleine up to that of butter, and by proper manipulation produced a substance not easily distinguishable from butter, while much cheaper. This substance he named oleomargarine, under the idea that butter contains margarine. This is a mistaken idea, and the name is not properly applicable. Butterine, which is frequently used, is a more correct title.

It is needless to describe M. Mège's method of manufacture, as an improved method is now adopted in

the American factories, in which large quantities of butterine are annually made. Briefly to outline the process, the beef fat is first thrown into tanks of tepid water. This is repeated three times, such of the fat as does not seem suitable being withdrawn after the first washing. All impurities having been thus removed, only pure white fat remains. This fat is minced in a cutting machine and melted by the use of live steam, the temperature being kept carefully between 114° and 122° F., and about 5 per cent. of salt being added. The membrane sinks to the bottom of the kettles, and the pure floating fat is drawn off. After some other purifying processes the fat is allowed to solidify very slowly. It is then exposed to a pressure of 3000 lbs. to the square inch, in order to separate the butter oil from the stearine. This is kept up until the butter oil, or oleomargarine, ceases to flow, the stearine residue remaining as a hard, white, dry mass. Much of the oil is exported to Europe in this way, there to be churned with milk into artificial butter. If properly sealed up, it will keep an indefinite period. It is of a light yellow color and an agreeable taste, melting in the mouth like butter. When churned it is mixed in the proportion of 442 parts oleomargarine, 120 parts milk, 37½ of butter, and 1½ oz. bicarbonate of soda. This is churned from 5 to 10 minutes, some coloring matter added, and then churned from 30 to 40 minutes longer. The substance produced resembles butter in taste and appearance, though it has a tendency to crystallize, and become lumpy. This is avoided by chilling it during the process of hardening.

Pure oleomargarine butter is said to contain every element that enters into cream butter, and to keep pure much longer. But there is the defect of not knowing when it is pure, or what injurious ingredients or objectionable processes may be used in its manufacture by irresponsible parties. It is, however, manufactured in large quantities in America, partly for home use, but more largely for shipment to Europe. Three factories in the State of New York produce not less than 4500 tons yearly, while similar factories exist in nearly all of our large cities. In some of these factories lard is mixed with oleomargarine, yielding compounds known as lardine, suine, and lard cheese. In 1880 the statistics of the oleomargarine manufacture were as follows:

Establishments.....	15
Capital invested.....	\$1,680,000
Value of material.....	5,486,141
Value of product.....	6,892,939

The factories were situated principally in New York, Kentucky, Ohio, Illinois, and Pennsylvania. Since that date their product has largely increased.

Recent reports from Holland state that the exports of oleomargarine from the United States are steadily increasing, and were much larger in 1887 than in former years, and that all measures taken to suppress the manufacture of artificial butter serve only to make it better known and more popular, and to increase its consumption. The law in Germany against it, for instance, has been followed by an extension of the butter factories, while the new law against butterine in England, which took effect Jan. 1, 1888, promises to have a similar effect. The exports of American butterine in 1887 to the two ports of Rotterdam and Amsterdam were 184,600 tierces, containing about 60,000,000 lbs. This was one-third more than the 1886 export. Holland imported as much in 1887 from European factories, while making much in her own factories. The making of artificial butter, indeed, is now the largest manufacturing interest of the Netherlands. The annual consumption in Paris at present is from 60,000 to 80,000 lbs. daily.

In view of the extensive and growing sale of this substance in the United States as cream butter, restrictive laws have been passed by several of the States, and the

better to prevent fraudulent sales Congress has recently passed a stringent law taxing the manufacture and sale, and requiring under penalty that every package containing artificial butter shall be duly marked with the name of its contents, and that retail dealers shall not sell except from the original packages. The law lays on manufacturers a tax of \$600, on wholesale dealers of \$480, and on retail dealers of \$48, with an additional tax of 2 cents on every pound sold. This law has gone far to restrict the fraudulent sale. Sold for what it is, oleomargarine is not likely to interfere greatly with the dairy business of this country, as it will be used mainly for cooking purposes. Its use as table butter is likely to be mainly confined to the poorer classes of Europe.

We append a comparative analysis of natural and artificial butter, which shows that when properly made the latter is a wholesome and satisfactory substitute for the former.

	Fat.	Caseine.	Ash.	Water.
Good market butter.....	86.06	0.42	0.12	13.77
Poor ".....	82.60	0.72	0.20	17.18
Artificial butter, Mège's process.....	86.24	1.20	12.56
Artificial butter, American process.....	87.15	0.57	1.63	11.50
Frankfort Margarine Co.....	87.97	0.26	0.17	11.42

(C. M.)

OLIN, STEPHEN (1797–1851), preacher and educator, was born at Leicester, Vt., Mar. 3, 1797. He was the oldest son of Judge Henry Olin (1757–1837), who was lieutenant-governor of Vermont 1827–29. He graduated at Middlebury College in 1820, and became principal of an academy in South Carolina. In 1824 he entered the South Carolina Conference of the Methodist Episcopal Church. In 1826 he was made professor of English literature in the University of Georgia, and in 1834 became president of the Randolph-Macon College, Virginia. He went to Europe in 1837 and made an extensive tour in the East, which is described in his *Travels in Egypt, Petra and the Holy Land* (1843). Being made president of Wesleyan University in 1842, Dr. Olin exerted himself with great success to give this institution high rank among American colleges. He was at this time at the height of his power as a preacher, intellectual, fervent, and practical. In 1846 he was a delegate to the first meeting of the Evangelical Alliance in London. He died at Middletown, Conn., Aug. 16, 1851. His *Sermons* were published in 1852, and his *Life and Letters* in 1853.

OLIPHANT, LAURENCE, a roving Englishman whose travels and adventures have furnished material for several books, was born in 1829, being the only son of Sir Anthony Oliphant, who became chief-justice of Ceylon in 1838. In 1850 Laurence accompanied Jung Bahadoor, the Nepaulese ambassador to England, on his return to Katmandu, and published an account of the journey. After studying at the University of Edinburgh and being admitted to the English bar, he visited Southern Russia. His book on *The Russian Shores of the Black Sea* (1853) acquired special interest from the Crimean war which soon followed. Oliphant next became private secretary to Lord Elgin, Governor-General of Canada, and was made superintendent of Indian affairs. His travels in this capacity gave occasion for his book on *Minnesota, or the Far West* (1855). He travelled through the United States and even accompanied a filibustering expedition to Central America. Returning to England he published *The Trans-Caucasian Provinces* (1855) and then hastened to join the army of Omar Pacha in a campaign to that region. In 1857 he was again private secretary to Lord Elgin, then minister plenipotentiary to China, and subsequently published an account of this mission. In 1861, while he was acting as *chargé d'affaires* in Japan, a bold attempt was made on his life and he was severely wounded. In 1865 he was elected to Parlia-

ment from Sterling, but he resigned in 1868, and with his mother joined the religious community established by Thomas L. Harris (q. v.) at Portland, N. Y. In 1870 he returned to Europe and was for a while Paris correspondent of the *London Times*. In 1873 he became the agent of a trans-Atlantic telegraph company and resided in the United States. After a few years he went to Syria with a view to establishing a colony there. This project was only partly successful, but he made explorations of the country east of the Jordan, which are described in *The Land of Gilead* (1881). Besides the books of travel already mentioned his *Patriota and Filibusters* (1861), *Piccadilly* (1870), and *Travels and Travesties* (1882) contain records of his observations of men and events. He has also published a novel, *Altiora Peto* (1883), and *Huifa* (1887), a description of contemporary life in Palestine, as seen in a second visit, connected with his colonizing project.

OLIPHANT, MARGARET WILSON, an English novelist of Scotch extraction, was born at Liverpool in 1818. Her first novel, *Passages in the Life of Mistress Margaret Maitland* (1849), was an attractive revelation of life in a Scotch parish. She continued to exhibit Scotch life and character in several stories, but afterwards gave equally excellent delineations of the life of English rural towns. The most noted of these is *Chronicles of Carlingford* (1863), which was continued in several volumes. All her stories are marked by a subdued yet earnest religious tone. In 1862 she published an interesting *Life of Edward Irving*, and she has also given to the world biographies of *St. Francis of Assisi* (1870) and *Count Montalembert* (1872). In *The Makers of Florence* (1876) she depicts Dante, Giotto, and Savonarola; and *The Makers of Venice* (1888) is a similar work. She has also contributed to the history of England in her *Historical Sketches of the Reign of George II.* (1869). Her *Literary History of England* (1882) is confined to the end of the eighteenth and beginning of the nineteenth century. Her *Life of Sheridan* (1883) in the series of "English Men of Letters" is a pleasing sketch. Her latest biography is that of Principal Tulloch, of whom she was a warm admirer.

OLIVER, ANDREW (1706-1774), lieutenant-governor of Massachusetts, was born at Boston, March 28, 1706. He graduated at Harvard College in 1724, and was a member of the General Court, and afterward was secretary of the province. In 1765, having accepted the office of distributor of stamps under the stamp-act, he was compelled to resign under the Liberty Tree, August 15. In 1771 he was appointed lieutenant-governor, and with his brother-in-law, Governor Hutchinson, secretly furthered the designs of the British ministry. The General Court, discovering this, petitioned the king for the removal of both. Lieutenant-Governor Oliver died at Boston, March 3, 1774. He was succeeded in office by his relative, THOMAS OLIVER (1734-1815), who was compelled by the people to resign Sept. 2, 1774, and afterwards went with the British troops to Halifax, and thence to England.

Andrew's brother, PETER OLIVER (1713-1791), born March 26, 1713, graduated at Harvard College in 1730. After holding several offices in Plymouth co., he was in 1756 made a judge of the Supreme Court, and in 1771 became chief-justice. In 1774, having refused the demand of the Assembly to engage to receive no pay except from that body, he was impeached. He afterwards accompanied the British troops when leaving Boston in 1776. He died at Birmingham, England, Oct. 13, 1791.

OLLIVIER, ÉMILE, a French statesman, was born at Marseilles, July 2, 1825. He was the son of Demosthène Ollivier, an ardent republican, studied law at Paris, and was admitted to the bar in 1847. When the Republic was established in 1848 he was made commissary-general at Marseilles, but soon returned to his profession. After the *coup d'état* of December, 1851,

his father was driven from France, but Émile, prudently avoiding politics, acquired high reputation as an advocate. In 1857 he was elected to the Chamber of Deputies, where he became a leader of the opposition. But his hostility to the emperor gradually abated and finally, in 1867, he was entirely won over. In December, 1869, he was called by the emperor to form a cabinet and draft a constitution. This plan was approved by the plébiscite, May 8, 1870, but the declaration of war against Germany and its disastrous results overthrew first his cabinet and then the Empire. Ollivier retired to Piedmont, but towards the end of 1872 returned to his home at Passy. In 1870 he had been elected to the academy on account of his official position, but when he now attempted to take his seat in 1874 his inaugural address caused disturbance by its defence of the Empire. On other occasions disputes arose and finally, in May, 1879, he withdrew from the academy. In early life he assisted in founding and conducting a law magazine. He afterwards published various political essays. His latest works are *L'Église et l'État au Concile du Vatican* (2 vols., 1879), and *M. Thiers à l'Académie et dans l'Histoire* (1880).

OLMSTED, FREDERICK LAW, an American landscape gardener, was born at Hartford, Conn., Nov. 10, 1822. He studied engineering and natural science at Yale College, and became a farmer. In 1848 he began to manage a fruit-farm on Staten Island. In 1850 he made a tour in England which he narrated in his *Walks and Talks of an American Farmer in England* (1852). On his return he made a journey on horseback through the Southern States, as correspondent of the *New York Times*. His letters drew attention to the deplorable effects of slavery on agriculture. They were collected in his volumes, *A Journey in the Seaboard Slave States* (1856); *A Journey through Texas* (1857); *A Journey in the Back Country* (1860); and a general summary was given in *The Cotton Kingdom* (1861). In 1855 he had made a tour on the Continent of Europe to examine the parks, and when in 1856 plans for laying out Central Park, in New York, were called for, that offered by Mr. Olmsted and Calvert Vaux was adopted. Mr. Olmsted was appointed architect and chief engineer, and carried out his plans energetically until the outbreak of the civil war. He then became secretary of the U. S. Sanitary Commission. After the war he was again made architect-in-chief of the Central Park, and was also engaged in laying out parks in Brooklyn, Washington, and Chicago. In 1878 he was removed from office by a new board of commissioners, but he has conducted his labors with much success in parks for other cities. His firm has had charge of the Niagara Reservation Park.

OLSHAUSEN, HERMANN (1796-1839), a German theologian, was born at Oldesloe, Holstein, Aug. 21, 1796. He was educated at Kiel and Berlin, and in 1821 was made professor extraordinary of theology at Königsberg, becoming full professor in 1827. He accepted a call to Erlangen in 1834, and died there Sept. 4, 1839. His chief work is a *Biblical Commentary on the New Testament* (4 vols., 1830-40). It was completed by Profs. Ebrard and Wiesinger (vols. 5-7, 1850-53). Prof. A. C. Kendrick revised the American edition (6 vols., 1856-58).

His brother, JULIUS OLSHAUSEN (1800-1882), a distinguished Orientalist, was born May 9, 1800, and educated at Kiel, Berlin, and Paris. In 1823 he was made extraordinary professor at Kiel, and in 1830 became full professor. In 1848 the provisional government of Holstein entrusted to him the superintendence of the university. He also represented the city of Kiel in the parliament, of which he was made vice-president. In 1852 the Danish government came into possession of the country, and Olshausen was deprived of his office. In 1853 he was made librarian and professor of Oriental languages at Königsberg. In 1858 he was made councillor in the Prussian ministry of education. In 1874 he retired on a pension, and he

died at Berlin, Dec. 28, 1882. His Oriental researches related chiefly to the languages and antiquities of Persia, and to the Old Testament. Among his publications were *Erklärung der Paulinen* (1853); *Lehrbuch der Hebräischen Sprache* (1861); *Die Pehlewi-Legenden auf den Münzen der letzten Sassaniden* (1843). His latest investigations appeared in the publications of the Berlin Academy. See PAHLAVI in the *ENCYCLOPEDIA BRITANNICA*.

Another brother, THEODOR OLSHAUSEN (1802-1869), was an active politician and journalist at Kiel. In 1848 he took part in the provisional government, but he afterwards joined the democratic opposition. In 1849 he founded the *Norddeutsche Freie Presse*, at Hamburg. In 1851 he came to America, and edited a paper at St. Louis. Several German works on the Western States of America, prepared by him, were published at Kiel. In 1865 he returned to Europe and died at Hamburg, March 31, 1869.

OMAHA, the largest city of Nebraska, is on the west bank of the Missouri River, 600 miles above its confluence with the Mississippi. It is an important railroad centre, having several lines to Chicago, St. Louis, Texas, and California. A belt-line railroad encircles the city, accommodating local trade and enabling the trunk lines to reach the business centre. There are over 20 miles of street railroad track. The streets are 100 ft. wide, and in the business part are paved with asphalt or stone. Three squares are reserved for parks. Large and costly buildings line the principal streets. Among them are a fine city-hall, court-house, U. S. government building, Joslyn and other hotels, Boyd's opera-house, the national banks, and various buildings for business purposes. The Chamber of Commerce, organized in 1885, has a handsome and commodious building. In 1886 the Omaha Exposition building was completed; its main hall seats 6000 persons. The wholesale business of the city, which exceeds \$75,000,000, is conducted by 250 firms and there are over 2000 retail firms. The prosperity of Omaha is due to the railroads; though it was founded in 1854, the first railroad from Chicago entered the city in January, 1867. The Union Pacific was completed May 10, 1869, and at once gave a great impetus to the city. Previously the Missouri was here crossed in winter on a pile bridge, which was removed during the season of navigation. Soon an iron bridge, 2750 ft. long, was built at a cost of \$2,500,000, and it has since been enlarged at a further expense of \$1,000,000. Omaha has 60 churches, 25 school-buildings, a high-school, Creighton College, Brownell Hall for young ladies, a Catholic academy, a medical college, and a business college. The industrial works comprise large smelting- and refining-works, car-shops, and various factories. The city is lighted with gas and electric light. The water supply is drawn from the Missouri, being filtered and allowed to settle in a reservoir. The daily consumption exceeds 8,000,000 gallons. Since 1884 there has been a city paid fire department, besides one belonging to the Union Pacific Railroad. There are 40 miles of sewerage; garbage is removed by boats which dump it in the middle of the river-channel. The city limits extend 8 miles along the river and 4 miles back. It is governed by a mayor and 12 councilmen, the mayor being chosen for two years. The annual expenses exceed \$1,000,000, yet the amount is raised with little difficulty. The bonded debt is \$857,950. In 1886 the school census showed 11,831 persons of school age, indicating a population of nearly 60,000, and this has continued to increase.

Near the city the U. S. government has a tract of 82½ acres for military purposes. It contains the headquarters of the Department of the Platte. In South Omaha are the extensive stockyards of the Union Pacific Railroad.

OMAHAS, a tribe of American Indians of the Dakota family (see DAKOTA INDIANS). They were known to the explorers of the Upper Mississippi as

peaceful and inclined to agriculture. They were harassed by the Sioux and other tribes. About 1800, being severely afflicted with small-pox, they burned their villages, and journeyed southward along the Missouri. Lewis and Clarke report their number as 600 in 1805. In 1815 the first treaty was made with them by the United States when they ceded Council Bluffs. The Sioux continued to persecute them, but after these enemies were repressed by the U. S. troops the Omahas improved greatly. Their reservation in Northern Nebraska comprised 375,000 acres. About 1883 an experiment was made in leaving them to take care of themselves. They have suffered somewhat, but appear to be learning self-reliance. They still have the benefit of Presbyterian missionaries and the mission and industrial boarding-schools were reported in 1887 as crowded. Besides these schools, many of the children are taught at Carlisle, Pa., Hampton, Va., and other places. The number of Omahas in 1887 was reported to be 1175.

OMAR PACHA (1806-1871), Turkish general, was born at Plaski, Croatia, in 1806. He was the son of an officer of the Austrian army and was originally named Mikail Lattas. While serving in 1833 in a regiment on the frontier he incurred disgrace and fled to Bosnia, where he professed the Moslem faith. Being made tutor of the sons of Hussein Pacha, he went to Constantinople, where he also taught Abd-ul-Medjid. In 1839 the latter became sultan and made his tutor colonel and afterwards brigadier-general. In 1842 he was military governor of Lebanon and soon became pacha. Called thence to subdue rebellions in Albania and Bosnia, he displayed remarkable energy. In the war with Russia in 1854 he was appointed generalissimo, and drove the Russian invaders out of the Danubian principalities. In 1855 he successfully defended Eupatoria and was sent to the relief of the besieged Kars, but arrived too late. After the war he was governor of Bagdad, but in 1859 was dismissed for maladministration and banished to Kharput. Restored to office in 1861, he was again employed in Bosnia. In March, 1867, he was sent to suppress the rebellion in Crete, but his cruelty occasioned his recall in October. Thenceforth he was one of the Sultan's council till his death, April 18, 1871.

ONCKEN, JOHANN GERHARD (1800-1884), a German evangelist, was born at Varel, in Oldenburg, Jan. 26, 1800. In his youth he visited England and there joined an Independent congregation. He was sent as a missionary to Germany by the British Continental Society in 1823. He afterwards became at Hamburg the agent of the Edinburgh Bible Society and was the first to establish a Sunday-school in his native land. In 1834 he adopted Baptist views and as the laws of the country were severely intolerant he was secretly baptized by Rev. Barnas Sears, who was then studying in Hamburg. Oncken became the pastor of the first Baptist church in Germany, founded in April, 1834. Soon after he was appointed a missionary of the American Baptist Convention. His religious work was conducted throughout Germany, Switzerland, and Denmark, by preaching, distributing the Scriptures, and forming congregations. In his fidelity to duty he braved the most serious opposition and on some occasions endured corporal chastisement. His labors were so incessant and his success was so marked that he became widely known as "the German Apostle." In prosecution of his work he visited the United States in 1852 and 1865. After a long and faithful life he died Jan. 2, 1884. He had published and edited many tracts and religious journals.

ONONDAGAS. See IROQUOIS.

ONTARIO, LAKE, the smallest of the chain of great lakes which finally empty into the St. Lawrence River, has a length of 190 miles; maximum breadth, 55 miles; and maximum depth, 600 ft. So great is

the number of small bays and inlets that the circuit is over 500 miles. The principal harbors are Kingston, Coburg, Toronto, and Hamilton, in Canada; and Charlotte, Oswego, and Sackett's Harbor in New York. The commerce of the lake is very important, connection being made with the Erie Canal and the Hudson River through the Oswego Canal, and with the upper lakes through the Welland Canal, which connects Lake Ontario with Lake Erie, the entrance to the former lake being at Port Dalhousie. The level of Lake Ontario is 250 ft. above the ocean. Therefore the bottom of the lake, in some parts, is 350 ft. below the surface of the ocean. Ontario being much shallower than any other of the great lakes (with the exception of Erie), the bottoms of the upper lakes drop to about the same level as that of Ontario.

The discharge of water through the Detroit River from the lakes above, after allowing for the probable portion carried off by evaporation, does not appear by any means equal to the quantity of water which the three upper lakes receive. It has been conjectured that a subterranean river may run from Lake Ontario. This conjecture is not improbable, and, if correct, accounts for the singular fact that salmon and herring are caught in all the lakes communicating with the St. Lawrence, but in no others. As the Falls of Niagara block the way, it would seem that the fish reached the upper lakes by some underground river. The theory of an underground river has also been adopted by several scientists who have been watching the variations in the levels of the great lakes. There are two kinds of variations: the annual, which rise from the melting of the snows in the spring; and the occasional, which come at various intervals. All of the lakes west of the Niagara River are subjected to the occasional variations. The period of each rise and fall covers from 4 to 7 years. The variation from lowest to highest points has sometimes been as much as 3½ ft. These variations are aside from those caused by the winds. In September and October Lake Michigan is subject to an annual flood-tide, the ebb-tide occurring in January, February, and March. Lake Ontario is subject to such variations, but, apparently, in a less degree. The fact that certain of the variations have taken place at the time variations were noticed in the upper lakes tends to confirm the theory of the underground channel. In 1886 the superintendent of the U. S. Life-Saving Service, in which Lake Ontario is included, reported that the unusual high water all along the lake had become troublesome. At the same time there was high water in Lakes Erie and Michigan. On the other hand there have been periods when the level of Lake Ontario has fallen to such an extent that the towns along its banks became alarmed lest they should be left in the interior. One reason assigned was that Lake Erie had become so filled up by sand brought down from the Detroit River that it had become itself merely a river, thus keeping back the flow of water and allowing it to evaporate in the upper lakes. Another reason given was that the outlet of Ontario, the River St. Lawrence, had been so enlarged by the enlarging of a canal at "The Gallops" Rapids that more than twice the usual quantity of water had passed through. In other words, the removal of the natural dam of Lake Ontario had resulted in lowering the level of the lake. At the present time (1888), however, there appear to be no complaints in regard to the level. There are on record a number of instances where the level of the lake has risen suddenly by the appearance of a tidal wave. Such a wave caused the water to rise 22 in. at Charlotte (the port of Rochester) in 1872.

Ontario, being the lowest of the Great Lakes and surrounded by some of the largest mountain ranges in the country, forms an intensely interesting subject for scientific investigators. The geology and topography of the lake are so combined that they cannot readily be separated. The eastern end of the lake is confined

by the Laurentian rocks of the Adirondack Mountains of New York, and its outlet is over the low and narrow barrier of the same, forming the Thousand Islands. The lake itself is excavated out of the soft Lower Silurian rocks. The northern limit of the basin is an east and west line, about 50 miles back from the northern shore. Its southern limit is made by three remarkable escarpments, ranging in parallel east and west lines from the Hudson River to Lake Erie, caused by the broad outspread and almost imperceptible southern dip of the whole palæozoic system, from the Potsdam sandstone at the bottom of the Silurian to the coal-beds at the bottom of the Carboniferous rocks. The baset edges of the formations make a series of steps toward the north; while down the southern slope, almost from the very edge of the lakes of Central New York, flow all the northern waters of the Delaware, Susquehanna, and Ohio Rivers. The lowest escarpment is that of the Niagara, or Middle Silurian, formation which commences at a slight elevation between Albany and Utica, along the south side of the Mohawk Valley, and crosses the Niagara River at Lewiston. Back of this runs the escarpment of the Helderberg, or Lower Devonian, limestones, forming high hills south of the Mohawk, but dying away as it approaches Lake Erie. Still farther south, and at a still higher elevation, runs the high escarpment of the Upper Devonian sandstone, from the base of the Catskill Mountains, on the Hudson, to Lake Erie. The range runs along the southern shore of Lake Erie into South-western Ohio. At an elevation of 1000 ft. above Lake Erie are the bituminous coal-fields of Ohio and Pennsylvania, and from the northern part of these fields the River Genesee cuts its way through the three escarpments into Lake Ontario. In the western and central parts of the State of New York deep valleys have been cut between the middle and upper escarpments and into the Lower Devonian terrace. These are known as Lakes Canandaigua, Cayuga, Seneca, Crooked Lake, Auburn, and Skaneateles—all of them, with Lake Oneida, at the foot of the lowest escarpment, drained by the Oswego River into Lake Ontario. But the principal drainage of Southern New York is southward through the upper escarpment and by deep gorges in the Allegheny Mountains of Pennsylvania, by the Susquehanna River and Chesapeake Bay, into the Atlantic Ocean. In Western New York the same set of the waters away from Lake Erie carries the drainage into the Allegheny, Beaver, and other affluents of the Ohio, the head waters of which, therefore, overlook Lake Erie 1000 feet from a distance of scarce a dozen miles. There are, in fact, several spots along the watershed where the head waters of the St. Lawrence, the Susquehanna, and the Allegheny may be fed by the same cloud. Lake Chautauqua, which drains into the Allegheny River, is much farther north and at a much higher elevation than the interior lakes of New York, named above, which drain into Lake Ontario. The lowest or Middle Silurian escarpment crosses the Niagara River and becomes the constant limit of the basin of Lake Ontario. At Lewiston Heights it is 365 ft. above the lake. Entering the Province of Ontario it turns about the head of the lake and runs to the Georgian Bay and then to Lake Huron at Cape Hurd. The Blue Mountains of Georgian Bay are of the Upper Silurian strata. This makes Lake Simcoe lie in a hollow of the Lower Silurian lakes similar to that which confines Lake Ontario, Lake Champlain, and the Gulf of St. Lawrence. Lakes Simcoe, Ontario, and Champlain, and the Gulf of St. Lawrence would form a continuation of the same water basin if it were not for the rise in the Lower Silurian rocks between Simcoe and Ontario and the upper of the Laurentian rocks at the Thousand Islands, below which are all the rapids of the St. Lawrence down to Montreal. It is, apparently, agreed by geologists that when the whole of this part of the continent was submerged 300 or 400 ft. below the

present surface of the ocean there was one island known now as the Adirondack Mountains of New York; and there was another island known now as the Green Mountains of Vermont and Western Massachusetts. In those days it is said that the northern shore of the Gulf of St. Lawrence extended as far as the Lac des Chats. In that case Lake Ontario was simply a hole in the bottom of a great inland sea which covered also the Falls of Niagara and probably rose above the present level of the Great Lakes which lie above the falls.

The topographical advantages of Lake Ontario have also given it a prominent place in American history. From the earliest settlement of the country this lake was a favorite route of transportation to the West. In the war of 1812 important conflicts were waged on the lake and the adjoining shores. (F. G. M.)

OOSTERZEE, JAN JAKOB VAN (1817–1882), a Dutch theologian, was born at Rotterdam, April 17, 1817. He was educated at the University of Utrecht, and was ordained in 1841. After a few years' service in village churches he was in 1844 called to the principal church in Rotterdam, where he was noted for his earnestness and eloquence. In 1862 he was made professor of theology in the University of Utrecht, but from 1867 his work was chiefly in New Testament introduction and the philosophy of religion. He was a voluminous writer and was justly regarded as the leader of Evangelical thought in Holland. In 1871 he declined a call to a professorship in the theological seminary of the Reformed Church in America at New Brunswick, N. J. The fortieth anniversary of his ordination was celebrated in May, 1881, when, although oppressed by physical weakness, he preached a sermon of great power, and afterwards received testimonials from his numerous pupils. He died July 29, 1882, at Wiesbaden, Germany, where he had gone for the benefit of his health. Among his publications were a *Life of Jesus* (3 vols., 1847–51); *Christology* (3 vols., 1855–61); *Theology of the New Testament* (1867); *Christian Dogmatics* (1872); *Fear of Salvation* (2 vols., 1874); *Moses* (1876); *Practical Theology* (1878). Most of these works have been translated into English. Dr. Van Oosterzee contributed to Lange's great work commentaries on the Gospel of Luke, the Pastoral Epistles, and the Epistle of James. He left some works in manuscript, including an autobiography.

OPERA. This article is restricted to the history of operatic performances in the United States. Opera of any kind first made its appearance in this country, it seems, in 1750, when the *Beggar's Opera*, which had gained an immense popularity in England, was produced for the first time on the New York stage. This was soon followed by others. Bickerstaff's *Love in a Village* was produced in 1768, and his *Maid of the Mill* in 1773. Numerous others were given during the succeeding years, including *The Duenna* (1791); *Inkle and Yarico* (1793–4); a number by Dibdin; *Children of the Wood* (1794–5); *Blue Beard* (1801); *The Revue* (1807); etc. The singers prominent at this time were Benjamin Carr, an Englishman, who later settled in Philadelphia as a music teacher, Miss Broadhurst, Miss Brett, Mrs. Oldmixon, who made her debut here in 1798; Miss Catherine Leesugg, contralto; Miss Kelly, sister of the Irish composer, and the two eminent English singers, Philips and Incedon. During 1813–17 *Athis*, *The Miller and His Men*, *The Farmer and His Wife*, and *The Devil's Bridge*, all by a new English composer, Henry Bishop, were produced. In 1823 John Howard Payne's drama, *Clari the Maid of Milan*, was produced, with music by Bishop (among the pieces the now famous "Home, Sweet Home"). German music also began to be heard. In 1825 Weber's *Freischütz* was given, with great success—not entire, however, but "adapted" in parts.

At the same time that these English operas and operettas were being produced in New York, various French companies were performing the lyrical drama

in their own language in New Orleans, La. The first company of French comedians appeared there in 1791. But although, as Ritter says, "it is safe to presume that light musical farces and operatic pieces were enacted from time to time," the first positive date we have is 1810, in which year the *Barber of Seville* and *Romeo and Juliet* were presented. After this, and until the outbreak of the civil war, French opera was given frequently there, and the companies also made occasional visits to New York. Several opera-houses were built in succession, the latest completed in 1859. French opera, i. e., the light operetta (*opéra-bouffe*) of Offenbach, Lecocq, and other composers, first made its appearance in this country in 1867, when *La Grande Duchesse* was produced and had a run of 158 nights. Maurice Grau did much to popularize this kind of music, introducing to the American public a number of well-known French artists, notably Aimée, Judie, Paola Marie, and Theo. More recently, the English comic opera, as represented by Gilbert and Sullivan's *Pinafore*, and similar works, has found favor with the American public.

Italian opera made its first appearance here in 1825. In that year Garcia brought over a good Italian company to New York. *Il Barbiere* was the first opera given, followed by *Otello*, *Romeo e Julietta*, *Il Turco in Italia*, *Semiramide*, *Don Giovanni*, and others. But although Garcia's company included such excellent singers as his own daughter, Mme. Malibran, he had but poor success, and in 1826 went to Mexico. After this, and until 1832, operas were produced at various times in New York, but no work worthy of note was accomplished. In 1832 the tenor singer Montessor brought an Italian opera company to New York. A number of new works were produced, but the venture was a failure. In 1833 an opera-house was built, which was burned in 1839. An Italian company, under the management of Rivaflinoli and Da Ponte, gave performances there, and collapsed, as a matter of course, as did also its successor, organized under the management of Porto and Sacchi. Among the artists in these two companies were Clementina and Rosina Fanti, Louisa Bordogni, Schneider-Maroncelli, Signors Fabi, Raviglio, De Rosa, and Porto. Meanwhile opera in English continued to make its appearance. In 1837 Mme. Caradori-Allen gave operas at the Park Theatre, and the Seguin troupe at the National Theatre. Two years later another English company appeared in opera, which gave, amongst other works, Beethoven's *Fidelio*, for the first time in America. The Seguins later had great success at the Park Theatre with the novelty, Balfe's *Bohemian Girl*, and Mrs. Anna Bishop and W. H. Reeves appeared in 1847. In 1843 a certain Palmo built a new opera-house in Chambers street, which was opened the following year. Italian opera was given there for four years, after which the place was abandoned as being too small. At this time a movement had been set on foot to have an opera-house built in a more convenient location. The enterprise was placed on a firm basis for five years at least, by subscriptions to support Italian opera for 75 nights a year during that period. The Astor Place Opera-House was opened in 1847 with Verdi's *Ernani*. The place came under the management of Salvatore Patti, who was succeeded by Edward Fry in 1848. Both had ill success, and Fry in turn was succeeded by his musical director, Max Maretzek. The latter gave Italian opera there for several years, producing a number of new operas, but the final result was the same, and the place was abandoned at the end of the five years. In spite of all the failures that had been witnessed, the hope of placing Italian opera on a firmer footing in this country was not abandoned. In 1853 the erection of the Academy of Music was begun, and it was opened the following year, Grisi and Mario among the singers who appeared. Maretzek gave opera here, as did also Maurice Strakosch (associated with Ullmann), under

whose direction Adelina Patti made her *début* in 1859. Mme. Lagrange, Mme. Frezzolini, and Carl Fornes were also in his company. Under Strakosch Christine Nilsson also came to the United States in 1870.

Various attempts were also made to introduce opera sung in German to the American public, the first probably in 1836, when Meyerbeer's *Robert der Teufel* was given, with Carl Bergmann as conductor. Carl Anschütz conducted German opera in New York in 1862, producing *Die Zauberflöte*, *Don Juan*, *Die Entführung aus dem Serail*, *Fidelio*, *Der Freischütz*, *Car und Zimmermann*, and other works. New York had its first taste of Wagner when Bergmann, in 1859, brought out *Tannhäuser* at the Stadt Theatre. A second attempt was made in 1870, in which year Adolf Neuendorff brought a company from Europe and produced *Tannhäuser* and *Lohengrin*. He later gave also the *Walküre*, and it was also he who brought over Wachtel and Pappenheim. During the succeeding years Maretzek, the Strakosch brothers (Maurice and Max), Ullmann, Carl Rosa and Grau gave seasons of Italian opera, as did later Col. James H. Mapleson, whose musical conductor was Luigi Arditi, an excellent musician. It was to a great extent the "star" system which caused the final downfall of the Italian opera. The enormous salaries paid to the principal performers made it impossible to procure competent performers for the minor parts and to put the operas on the stage in a complete and satisfactory manner. When the Metropolitan Opera-House was erected in New York, Henry A. Abbey became manager, with a troupe that included Christine Nilsson, Marcella Sembrich, Scalchi, Trebelli, Valeria, Fursch-Madi, Campanini, Stagno, Capoul, Del Puente, and Kaschmann. At the end of this season of Italian opera there was, as usual, a deficit. Abbey refused to undertake another season, and the plan of giving German opera was then seized upon as a last expedient (1884). Leopold Damrosch became director, and in one month engaged his company, which comprised some of the greatest German artists. With this he gave a series of remarkable performances. Notable and novel was the careful attention to details, every part being carefully presented. It was a tremendous blow struck at the "star" system. Among the operas given were Wagner's *Tannhäuser*, *Lohengrin*, and *Die Walküre*, and Beethoven's *Fidelio*. Some of these, as we have seen, had been heard before in New York. Yet even the efforts of Bergmann and Neuendorff, though very creditable, had left much to be desired. Damrosch died in 1885, and was succeeded by Anton Seidl as conductor. His son, Walter J. Damrosch, who had conducted the opera during his father's illness, was appointed assistant director. In 1886, under the management of Edwin M. Stanton, Wagner's *Meistersinger*, *Parsifal*, *Rienzi*, and *Götterdämmerung* were given, and in 1887 Wagner's *Tristan und Isolde*, Brüll's *Golden Cross*, Verdi's *Aida*, Goldmark's *Queen of Sheba* and *Merlin*, and also *Faust*, *The Prophet*, Spontini's *Ferdinand Cortez*, Nessler's *Trumpeter of Sackkingen*, Halevy's *Jewess*, and Weber's *Euryanthe*. The principal singers that have appeared at the Metropolitan are Lilli Lehmann, Marianne Brandt, Auguste Seidl-Krauss, Albert Niemann, Max Alvary, Emil Fischer, Adolf Robinson, Stritt, and Staudigl. At this time there was also a company formed under the name of the "American Opera Company," with Theodore Thomas as director. It comprised some excellent singers, and operas were given for some seasons in New York and in other cities, but with indifferent success. In the season of 1887-88 Italo Campanini made an unsuccessful effort to revive Italian opera. With a company that included Galassi and Scalchi he gave Verdi's *Otello* at the Academy, New York. The performances showed the shortcomings which always characterized representations of Italian opera, and this attempt emphasized more strongly the fact that Italian opera had been driven from the field.

A distinct operatic school does not yet exist in America, although a number of native composers have tried their hands at that form of composition. Probably, the first "American" opera produced here was William Dunlap's *Archers*, brought out in 1796, with music by Benjamin Carr, who came to America in 1794. Dunlap's *Vintage* was produced in 1799, with music by Victor Pelissier, a Frenchman residing in New York; who also wrote the music for E. H. Smith's *Edwin and Angelina*, produced in 1798. Another opera by Dunlap was brought out in 1800, with music by James Hewitt, who, like Pelissier, was a well-known orchestral leader. More notable efforts are *Rip Van Winkle*, by George F. Bristow, produced in 1855, and *Leonora* (1858) and *Notre Dame de Paris* (1864) by Wm. H. Fry. These three, as also Julius Eichberg's *The Doctor of Alcantara* (1862), enjoyed a certain degree of success. The number of operas by American composers is very large, but most of them are of a light character, modelled after the French operetta. They are, as a rule, marked by no originality, and have met with poor success. One of the latest native productions in grand opera is Silas G. Pratt's *Zenobia* produced at Chicago in 1882, which, though good in parts, was not very well received.

America has produced a number of singers of note, among them Clara Louise Kellogg, Adelaide Phillips, Emma Juch, Minnie Hauck, Emma Abbott, Marie Van Zandt, Emma Nevada (Emma Wixon), and others.

For fuller accounts of the opera in America see Frederic Louis Ritter's *Music in America* (New York, 1883), Maurice Strakosch's *Souvenirs d'un Impresario* (2d ed., Paris, 1887), and Max Maretzek's *Crotchets and Quavers* (New York, 1855). Numerous magazine articles on this subject have been written by Carl Rosa, Henry T. Finck, and others.

(F. L. W.)

OPIUM is obtained from the capsules of the poppy and is one of the most complex drugs known to *Materia Medica*. It has been raised in the United States, but, on account of the price of labor and the climate, without profit. The term "opium-eating," by which the habit of using it is commonly designated, is a misnomer, for in no proper sense is opium taken by the eating process. Among opium-takers the object, either for relief of pain or stimulation, is obtained by one of four methods, viz., draught, bolus, injections, and pipe. Of the first, the best known and most popular preparations are morphine in solution, laudanum, black drops, and paregoric. The second method consists in swallowing a pill made of the crude drug, or in combination with other narcotics. The alkaloids and salts extracted from opium come under this head. The medicinal *pilula opi*, sulphate of morphia, and codeia are the principal forms in vogue. The famous *Mash Allah* (the great gift of God) and *el magen* of the orientals may also be included in the bolus method. The former, made of opium and aromatics, is fashioned into lozenges and much used in Turkey. The latter is a conserve in which hyoscyamus is the adjunct and is found principally in Cairo. The third mode of placing the system under the desired influence is by injecting a solution of morphia by the hypodermic syringe, the place generally used being the arm. This method has found favor among literary and professional persons, perhaps because the drug acts more quickly and a smaller quantity will suffice; and it does not leave the peculiar nauseating after-effect which is often experienced by the other methods. Physicians invariably resort to the hypodermic syringe. This plan is doubly dangerous, on account of the liability at any time to pierce a vein; and because, with many, there is a certain fascination about the instrument which renders it more difficult for them to be cured of the habit. The syringe very often produces painful abscesses, and in every instance leaves scars and marks which may never be obliterated. The

pipe method consists in setting fire to a small piece of the chandoo, or smoking opium, about the size of a pea, and then inhaling the smoke through a pipe constructed for the purpose. Experienced smokers make full inspirations, swelling the lungs to their full expansion, and after retaining the smoke as long as they possibly can, exhale it through the nostrils. The pipe method is practiced for the most part in China, Turkey, and the Indian Archipelago. In San Francisco and New York nearly all the Chinese population smoke opium. This mode, however, is not exclusively confined to foreigners, for some Americans use the drug in combination with their tobacco; and it has recently appeared that an American opium-smoking society exists in a Western town. In the Ottoman and Chinese empires, and also in India, opium, either in bolus form or by means of the pipe, is used extensively by rich and poor.

Opium differs widely in its injurious effects, according to which of the different ways is adopted. The weight of opinion is that smoking is the least injurious. The effects of the drug, although exhilarating for a time, are purchased at a fearful cost. The smoker of the pipe progresses toward the final wreck with increasing pallor of eyes and face, that, once seen, can always be recognized. The morphine-eater shows a somewhat similar condition, varied by a tendency to pimples and eruptions, the result of the paralyzing effect of the drug upon the bodily functions and secretions. In all phases of the habit the will power is entirely subordinated. The victim is helpless. Any delay in taking the usual dose results in horrors of which the snake-seeing drunkard never dreamed. The stomach is gnawed by the terrible appetite as with the sharp teeth of some wild animal; pains rack the body and limbs; the head is also affected, and a general feeling of being on the very verge of total collapse invests the sufferer with a dread that is indescribable.

In the United States the use of opium in places called "joints" has been restricted to large cities, especially New York and San Francisco. In New York the joints became, for a time, the haunts of somewhat fashionable men and women; but since the passage of the State law, making it an offence to keep an opium-joint, places of this sort have disappeared. There is no law against the smoking of opium; but the enactment against the maintenance of places of that nature has given the police control of the matter. In spite of this practical prohibition to others the Chinese appear to be free to smoke the drug at joints as much as they please. Among the medical profession opinion is very much divided as to the nature of the intoxication produced by opium; but it seems to be agreed that there is no substitute for it, and no antidote. It is also practically agreed that the only method of curing the opium habit is for the patient to abandon the drug; whether he is to do so at once and forever, or by a retrogressive plan, diminishing gradually the dose of the accustomed stimulant, is a question upon which a diversity of opinion exists. The mode of treatment is determined by the experienced practitioner according to the peculiar circumstances of each individual case, and the constitution, character, and general make-up of the patient. But, in any event, there is one fate that awaits the victim, and he must firmly determine to brave it and bear it. At some time during the treatment, whichever mode it may be, he will have to endure much suffering, though he may be assured that competent physicians will use all the resources which medical science has placed at their command to ameliorate the distress. The disease is certainly vincible; and with a resolute will and proper treatment the victim can eventually come off victorious. It is evident that the use of opium as a stimulant is increasing in the United States. Some members of the medical profession state that this is because the use of whiskey is becoming less common; and they also say that while whiskey excites to quarrels, opium is more

disastrous to morals because the opium-eater will stop at no deceit, and sometimes hesitate at no crime, to possess himself of the drug. It is thought that one cause of the spread of the habit is the superficial knowledge of the drug and whatever remedies are supposed to be antidotes for its use. It has been suggested that physicians should make up the medicines they prescribe without letting the patient know of their composition; and that the use of syringes should never be within the sight of the patient, nor should the physician teach the use of them to patients.

All opium prepared for smoking comes from China, where the right to prepare it is sold by the government to the highest bidder for a term of years. The amount of crude opium imported in the United States in 1872 was 189,354 lbs.; in 1880, 243,211; in 1886, 471,276, and in 1887, 568,263 lbs. The price per lb. rose from \$2.50 in 1886 to \$4.75 in 1887 and still higher in 1888. The crude opium comes almost exclusively from Smyrna, being a product of Turkey in Asia. The chief place of importation for smoking opium is San Francisco. The importations of smoking opium in the United States for different years have been as follows: 1872, 49,375 lbs.; 1880, 77,196 lbs.; 1886, 46,207 lbs.; and 1887, 66,232 lbs. The U. S. government prior to 1883 imposed a duty of \$6 a pound upon opium for smoking; and since 1883 the duty has been \$10 a pound. The falling off since 1880 was probably owing to the increased duty; but there is suspicion that the actual amount was made up, if not increased, by smuggling. (F. G. M.)

OPOSSUM, or POSSUM, are English forms of the native Indian name of a marsupial mammal which inhabits a large part of the United States, distinctively called *Virginian opossum* by Pennant, in 1781, and technically *Didelphis virginiana*, first by Shaw, 1800. The form "possum" occurs in Lawson's *Carolina* (orig. ed. 1709) and is nearer the native original than "opossum," which is applied in Catesby's *Carolina* (orig. ed. 1731-48), and has always been the most current form, of which "possum" is supposed to be modified by aphæresis. The word in either form came to be applied: (a) to all the representatives of the Linnæan genus *Didelphis* (1766). These were five in number: (1) *D. marsupialis*, based on the philander of Seba, the opossum of Tyson, the carigue or carigueya of De Laet, Maregrave and others, the maritacaca of Ray, and the tlaquatzin of Hernandez, being thus a composite species. (2) *D. philander*. (3) *D. opossum*. (4) *D. murina*. (5) *D. dorsigera*. These species are mostly based upon descriptions given by Seba; all are said to be American ("Asia" very wrongly added as the habitat of one of them, *D. murina*). The Linnæan genus *Didelphis* (more correctly to be spelled *Didelphys*) corresponds to the modern family *Didelphyidae*, which is the only group of marsupials living in America, and includes the whole of the American marsupials, all the rest of the order *Marsupialia* being confined in the present geological epoch to the Australian zoogeographical regions. Thus the word "opossum" or "possum" came to mean "any American marsupial," of which there are several different genera and numerous species, ranging from middle portions of the United States to Patagonia. But (b) prior to 1800 the name "opossum" had been loosely extended to certain old world marsupials, in the vague manner which is not exclusively a fault of travellers and amateur naturalists, but also found in the writings of professed zoologists. Thus we read in Pennant of a certain "Javan opossum" which is a kind of kangaroo called "filander" by Le Brun in 1711, inhabiting some of the Papuan islands (but not found in Java); and various Australian marsupials, especially among the phalangers, are persistently called "opossum," with or without a qualifying term.

Returning to the proper definition of the term, as the name of "any American marsupial," and of no

other animals, thus corresponding in application exactly to the zoological family *Didelphyidae*, we may note that it covers two very distinct genera. One of these, *Chironectes*, contains the curious web-footed water-opossum or yapock of South America. The other is *Didelphys*, containing all the rest of the species, which vary so much in size, shape, degree of development of the mammary pouch, and other characters that they are often subdivided into several modern genera. One of these contains the small three striped opossum of Brazil, *D. tristriatus*, and is called *Hemimurus* or *Microdelphys*. A second has as its type the tiny mouse-like opossum, *D. murina*. A third includes larger species characterized by the absence or slight development of the pouch, as in *D. dorsigera* or *D. derbiana*, the young being carried on the back of the mother with their tails wrapped around hers. This group is called *Metachirus*, and its members grade into those of the fourth and last and best known division, *Didelphys* proper, which contains such large species as the crab-eating opossum of tropical and subtropical America, *D. canaliculatus*, and our own familiar Virginian opossum, *D. virginianus*.

This animal, to which we will now confine attention, abounds in the Southern States, extends into the Middle, and has occasionally been seen as far north as New York. It is about as large as a domestic cat, measuring 18 or 20 inches in length of head and body, with a tail of 12 to 14 inches; but individuals vary much in size. The head is conical, tapering to a long snout, somewhat like a pig's; the eyes are small and placed high up; the ears are large, high, rounded, thin, and nearly naked. The body is stout, and seems still thicker from the long, loose, and fluffy hair with which it is covered, overlying a copious short under-fur. The general color is gray, darkened on most parts with the blackish ends of the longer hairs. The limbs are short, and all four end in a kind of hand; for the opossum is pedimanous, or "foot-handed." There are five digits on each foot, all with claws excepting the inner toe of the hind foot, which is appposable to the others like a true thumb. The hands and feet are covered in part on the backs with short fur, but naked and callous on the palms and soles. The tail is long, cylindrical-tapering, naked and scaly in most of its length, and perfectly prehensile, so that it constitutes a serviceable "fifth hand."

The teeth are no fewer than 50, and of 4 kinds, indicating an omnivorous animal of carnivorous propensities, like the pig. The dental formula is: $i. \frac{1}{1}; c. \frac{1}{1}; pm. \frac{1}{1}; m. \frac{1}{1} \times 2 = 50$. The canines, especially the upper ones, are highly specialized.

The sexual organs and mode of generation of the opossum, so entirely exceptional among American mammals (outside of the family *Didelphyidae*), have given rise to wild and very gross beliefs among the negroes, some of which have been repeated beyond the vulgar. Thus it is said that coition takes place in the nostrils of the female; and the young grow upon the teats in the pouch, in consequence of the deposit of the sperm by the sneezing of the female into the pouch. But the genesis of such stories is easy to trace. In the male, the scrotum hangs loosely from the belly near the navel, and there are no outward signs of other genitals. This is because the penis is retractile, and ordinarily withdrawn within the same sphincter which guards the orifice of the anus. In copulation it protrudes from the anal orifice to the extent of about 2 in., and is forked at the end. It is furnished with several intrinsic muscles, for protrusion, retraction, erection, and the separation of the two prongs, so that each fork shall enter the corresponding (right and left) vaginal passages of the female. For in this sex the internal organs of generation are completely double, right and left, and both debouch externally by a single orifice not distinguishable on ordinary inspection from that of the anus. So that the female, like the male,

appears to be devoid of external genitals, and coitus seems to be effected per anum. The chief peculiarity of the female, externally, thus subsists in the pouch or *marsupium*, characteristic of the whole order *Marsupialia*. It is fully developed in the Virginian opossum as a furry bag on the belly, formed of a duplicature of the skin, with its mouth directed forward, and the walls furnished with appropriate contractor muscles. In the virgin opossum the pouch is inconspicuous, and scarcely admits the ends of two or three of our fingers; after bearing young, however, it is much larger, so that the whole of one's fist may be thrust into it. Inside the pouch, in the skin of the belly-wall, are the teats to the number of 13, twelve in a circle and one in the middle. The young are born after a few days' gestation (probably less than two weeks), in a very imperfectly developed and entirely helpless state, about as large as peas. They are immediately transferred to the pouch by the voluntary action of the mother, either with her lips or paws, and at once each one of them becomes firmly attached to a teat by the mouth, hanging like berries to a stem. In this state they grow rapidly, never letting go their hold until they have attained some size. As soon as they are capable of spontaneous actions, beyond the automatic act of suction, they may let go and take hold again when hungry, like the young of ordinary animals. Soon after this they may be seen putting their heads out of the pouch; then their first excursions are made over the body of the mother to the limbs, and especially the tail, to which they cling, and retreat into the pouch when alarmed as long as it is able to hold them. When grown too large for this, they ride about on the mother's back in a bunch, and at length leave her to shift for themselves, being at this time about the size of kittens a couple of weeks old.

The opossum is nocturnal, like most marsupials, and its hunting affords, with that of the raccoon, the characteristic sport of the Southern States. It is chased and treed by dogs at night, and either shaken out of the tree to which it takes refuge, or shot as it hangs by the tail. Its flesh is palatable, and resembles pork, especially in the fall, when it is chiefly hunted, and when it acquires a thick layer of fat all over the body. Its teeth are sharp, and capable of biting severely; but the opossum is a very timid and one of the most defenceless of animals of its size. It is tolerably active among trees, but its gait on the ground is a slow and shuffling amble. It spends most of its time during the day hiding in hollow logs and like retreats, and at night forages for its food, which consists of any small animals it can catch and overpower, as birds and their eggs, reptiles, insects, worms, etc., as well as various berries and other fruits, especially persimmons. It readily eats any kind of carrion, as a dead horse or cow, and often attacks domestic poultry. It has no voice beyond a kind of hissing, and a low growling when irritated.

There remains to notice one of the most remarkable of the opossum's traits—its habit of feigning death when at the mercy of its captors. Though ordinarily so timid, no amount of torture can then draw from it a sign of suffering. Such endurance, joined with remarkable cunning, frequently enables the creature to escape what would otherwise prove its destruction; and these traits have even given to the English language a proverbial expression of peculiar significance, the phrase, "Playing possum." (E. C.)

OPPERT, JULES, French Orientalist, was born at Hamburg, July 9, 1825. He is of Jewish descent and was educated at the University of Heidelberg, Bonn, and Berlin. In 1847 he took the degree of Ph. D., at the University of Kiel, and then studied chiefly the Zend language and literature. Being excluded from professorship in German universities on account of his religion, he went to France, where he became professor of German at Laval and at Rheims. He was sent in 1852 on a scientific expedition to Mesopotamia, and on his return was naturalized as a Frenchman. In 1854

he laid before the Institute his method of deciphering the cuneiform inscriptions and received the grand prize of 20,000 francs. Oppert also studied carefully the topography of ancient Babylon, and presented to the geographical department of the Institute a plan of that city. In 1857 he was made professor of Sanskrit in the school attached to the Imperial Library. In 1869 he began to teach also in the Collège de France and in 1874 was made full professor there. Among his works are *Études assyriennes* (1858); *Grammaire sanscrite* (1859); *Histoire des empires de Chaldée et d'Assyrie* (1866); *Babylone et les Babyloniens* (1869); *Mélanges perses* (1872); *Le peuple et la langue des Mèdes* (1879); *Fragments cosmogoniques* (1879); *Fragments mythologiques* (1882); *L'ambre jaune chez les Assyriens* (1880).

His brother, ERNST JACOB OPPERT, born at Hamburg in 1832, went to China in 1851 as a merchant, and made several visits to Corea, the results of which were published in *A Forbidden Land*, London (1879).

Another brother, GUSTAV SOLOMON OPPERT, born in 1836, was employed for some time in the Bodleian Library, and became professor of Sanscrit in the University of Madras in 1872. He has published treatises *On the Classification of Languages* (1879); *On the Weapons of the Ancient Hindus* (1880); *Contributions to the History of Southern India* (1882).

ORANGE is the fruit of *Citrus aurantium*, and perhaps of other species of *Citrus*, though long-continued cultivation has rendered the specific relations of the varieties of oranges somewhat doubtful. The genus *Citrus* and its allied genera were formerly classed as the orange family, *Aurantiacæ*, but they are now considered to form a subdivision of the *Rutaceæ*, or the rue family. The members of the genus *Citrus* are shrubs and low trees, often spiny, with aromatic, evergreen leaves. The flowers are very fragrant. There are not many species in the genus, and they are all natives of the tropics. The fruit is large, thick-rinded, and separated by partitions into numerous divisions, its few seeds being surrounded by large, juicy cells. The wood is hard, heavy, and close-grained. The leaves, the flowers, and the rind of the fruit abound in aromatic oils, while the juice of the fruit pulp contains citric acid.

The orange derives its specific name from Latin *aurum*, gold, in reference to its color. The common English name is a modification of the same, coming from the French. The flower of this species has five white petals, of oblong form, the anthers 20-anded, with their filaments grown together, so as to form various pencils. The flowers grow in little clusters on the sides of the branches. The fruit is a nine- to twelve-celled berry, globose or flattened at the ends, with a thin or rough golden yellow or tawny rind, and sweet or bitter-sour pulp. The rind is of spongy texture, with little glands which secrete an acrid volatile oil, with a strong, pungent taste. *C. Bigaradia* is a prominent variety of *C. aurantium*, and is notable for the fragrant of its flowers, from which is made the delicate and costly perfume, Neroli oil. The sweet orange is not so fragrant, and as a perfume-yielder is of less value than *C. Bigaradia*. This specific name but indicates a variety, as there is no specific distinction between the bitter and the sweet orange.

Under favorable circumstances the orange-tree is usually twenty-five or thirty feet high, and is graceful in all its proportions, the trunk being upright, the branches symmetrical, the bark of a delicate ash-gray color. The leaves are moderately large and shiny on the upper surface, with a slight appearance of down beneath. The flowers are of a delicate white color. The delightful aroma and the pure whiteness of the orange-flowers have long made them the favorite blossoms for the bridal-wreath. The orange is a native of South-eastern Asia, and seems to have been brought by the Arabs to Arabia and Syria in the

eleventh century and to Spain at a later date. This appears to have been the bitter orange, the sweet not being cultivated in these regions till perhaps the fifteenth century. From these countries it has been disseminated until now it is grown widely throughout the warmer regions of the globe. It is a long-lived and prolific tree, there being at Cordova, Spain, a number of monster orange-trees which are known to be 700 years old. The trunks are partly hollow and the bark cracked, yet they are still in good bearing.

The orange blooms but once a year, yet it seems often to have flowers, young fruit, and mature fruit on it at the same time. This comes from the habit in some regions of letting the fruit of the preceding year hang on the branches. In Italy the fruit intended for shipment is picked green, while that kept for home consumption remains on the trees all winter and reaches perfection in the succeeding spring and summer. It takes about fifteen years from the time of sowing before the orange comes to full bearing, but the delay in this respect is more than compensated by its persistence as a fruit-bearer. This is particularly the case in view of the fact of its frequent great bearing powers. It is said that as many as 20,000 oranges have been borne on a single tree in the Azores, while half this bearing to a single tree has been observed in Florida. As a rule an orange-tree bears from 500 to 2000 yearly.

In addition to the oil of Neroli (which gets its name from having been used as a glove perfume by the wife of the Prince of Neroli), the orange yields several useful products. The water from which the oil is separated is sold as orange-flower water, while what is known as oil of orange is obtained by squeezing the peel. A tea is made from an infusion of orange leaves which is considered efficacious in fevers, while the seeds yield a fixed oil of amber color, which is valued for reducing swellings and as a hair oil. In the French colony of Martinique large quantities of orange wine are made, which finds a ready sale in Turkey and Russia.

The orange is a surface-feeding plant; old trees make the surface a network of fine rootlets. Its culture is rapidly on the increase, the facilities of transportation to Northern markets and the cheapness with which it can be sold having greatly increased the consumption within recent years and brought many new regions of growth into competition with the old sources of supply. In the United States Florida has become an important orange-growing State, its fruit being of an acknowledged excellence which renders it a formidable rival to the oranges of Southern Europe and the West Indies, our former sources of supply. The superior ripe fruit which we receive from the Florida plantations is already superseding the half-ripe fruit hitherto shipped in enormous quantities to the United States.

On the settlement of Florida immense groves of wild orange-trees were found, so widely spread and so prolific that they were at first supposed to be indigenous, though it is now known that they must have been introduced by the early Spanish settlers. These oranges were of the bitter variety, the only one known in Europe at that date. Subsequently the Spaniards introduced the sweet orange, and both these varieties are now found wild, together with a hybrid, the bitter-sweet orange.

One of the pioneers in this culture was an Englishman, named John Eaton, who settled in Florida in 1837 and budded a grove of fifty wild trees with buds from the sweet orange. The result was highly encouraging. The bitter orange trunks proved excellent stocks for budding, and these fifty trees are still in full bearing, being said often to net \$1500 to \$1800 per season. One tree of this grove is the famous "Big Tree" of Florida, which often bears 10,000 oranges in a single season, and these of the finest quality. The other trees bear from 2000 to 5000 each.

Oranges grow luxuriantly in a considerable variety

See Vol. XVII.
p. 810 (p. 834
Am. Rep.).

of soils, and much land in Florida formerly unused is now devoted to orange-culture. High dry land and low moist soil seem alike suitable, while many groves are planted in the low hammock lands, under the shade of the giant oaks which there flourish. An orange-tree in full bearing is said to be valued at \$100 all over the State. Orange-trees are raised from the

Orange Gathering.

seed or are produced by budding and grafting the wild stocks. Culture from the seed takes much care, and among the enemies of the young plant one of the most dangerous is the ant, which seems to consider the embryo leaves a delicacy and is apt to bite them off as soon as they come above the ground. Hard-wood ashes and air-slacked lime are used to keep off this foe. Some orange-growers simply clear out the superfluous plants from a wild grove and bud the remainder. Others set out young wild trees and bud them, while still others bud stocks raised from the seed. There is a difference of opinion as to which of these methods is the best and most profitable, but it is generally considered that the bitter orange-stock, from its superior hardiness, is far superior to the sweet orange as the basis of a grove. Almost any soil but heavy clay is suitable, but severe frosts are fatal to the orange. This fact renders the shelter of oak groves, above alluded to, of value.

The orange has a variety of insect enemies. Fortunately none of these are borers, but all are open foes, which may be easily detected. One of the most injurious of these is the scale insect parasite, which first appeared about 1868 on some orange-trees introduced from China and quickly spread over the whole State. The growers have now learned how to fight it, and its ravages have been greatly reduced. A kerosene wash is used for this and the mealy bug, another juice-sucking parasite. The leaf-footed plant-bug is an enemy that can only be killed by gathering and scalding. There are various other insect enemies, among them the grasshoppers and katydids, who do great damage by devouring the leaves.

The area in Florida thoroughly adapted to orange-culture has been estimated at 10,000 square miles, a space capable of yielding an enormous crop. The sweet orange raised in this State is of the finest flavor, and has no superior in size, productivity, and general good qualities. A single acre has been known to produce ten tons of oranges, and this industry promises to become one of the highest value not only to the State but to the whole Union. Another locality of the American orange is Louisiana, the trees having been probably introduced there from Florida. The Louisiana oranges resemble those of Florida, though the yield per tree is said to be much greater. The favorite orange district in this State extends along the west bank of the Mississippi from a point about forty miles below New Orleans to the vicinity of Fort Jackson. For thirty miles in length there is an almost continuous orange-grove, some of the orchards being very large.

There are trees here said to be more than a hundred years old, which are still producing fruit.

The Louisiana produce is supplied to the people of the Mississippi Valley, as the Florida yield is to the Atlantic cities. To the Mississippi region comes also a considerable supply from California, the third important region of orange-culture in the United States. In Southern California large crops of oranges are raised, which, like Californian fruits generally, are of enormous size, but are said to be deficient in flavor as compared with those of the East. The cultivation of the orange within recent years has extended northward, until now excellent crops are produced in the valley of the Sacramento River. Its culture, indeed, may be enormously extended in the State, the principal check being the difficulty of finding a market for the crop. The Eastern market bids fair to be fully pre-empted by the Florida and Louisiana supply.

ORBIGNY, ALCIDE DESSALINES D' (1802-1857), a French naturalist, was born at Coneron, Sept. 6, 1802. He was educated at La Rochelle, and in 1826 went to South America, where he spent eight years in scientific exploration from Brazil and Peru to Patagonia. In 1852 he was appointed professor of paleontology at the Museum of Natural History at Paris. He died at Pierrefitte, June 30, 1857. Among his works are *Voyage dans l'Amérique du Sud* (9 vols., 1834-52); *Paléontologie française* (14 vols., 1840-54). He contributed to the *Dictionnaire Universel d'histoire naturelle* (24 vols., 1839-49), edited by his brother, Charles Dessalines d'Orbigny (born in 1806), conservator of the Museum of Natural History of Paris.

ORCHARDSON, WILLIAM QUILLER, a British artist, was born at Edinburgh in 1835. After studying art at the Trustees' Academy he painted portraits until 1863, when he removed to London. His pictures exhibited at the Royal Academy attracted favorable notice. Among these were *Flowers of the Forest*, *Hamlet and Ophelia* (1865), *A Hundred Years Ago* (1871). He was made an associate of the Academy in 1868, and a member in 1877.

ORCHIDS. Members of the *Orchidaceæ*, or orchid family, one of the most extensive orders of plants, including in all 394 genera and about 3000 species. They are endogenous herbaceous shrubs, always perennial, and occurring all over the world, except in the coldest and driest regions. In the colder localities they are generally terrestrial, but in the tropics are usually epiphytic, growing on stones and trees, and deriving their chief nutriment from the air. They are distinguished by irregular and often very beautiful flowers, which are often of remarkable shape, closely resembling some insect, bird, or reptile. This is caused by the variation in shape of one of the petals, the labellum, or lip, which becomes greatly transformed, and gives the flower its imitative resemblance. Another distinguishing feature is the adherence of the pollen in grains or waxy masses, and the one-celled inferior ovary.

The orchids are nearly always fertilized by insects, to which fact is probably due much of their singularity of form and also their frequent great fragrance. Some of them have thickened root-stocks which form underground tubers. Others swell into a tuber-like body, called the pseudo-bulb, above ground. The leaves are greatly varied: some being thin and temporary, others thick, fleshy, and persistent; some spreading into a broad foliage, others long and slender, like whip-cord. There are few useful plants in the order, extensive as it is, the vanilla being the only orchid of marked commercial value.

The United States has comparatively few native species of this great order. Of late years, however, florists have succeeded in successfully cultivating in greenhouses many tropical epiphytes, they being greatly admired for their beauty or singularity. The great variety of orchids necessitates variation of method

in their cultivation. The terrestrial forms are propagated by division of the tubers, or of the pseudo-bulbs, each piece having one or more. Those with aerial roots are similarly propagated by division, the seed being rarely used for this purpose. In choosing soil for the ground-growers the question of nutriment is not important, as these plants depend very little on the soil for their food. The best soil is one that is not retentive of moisture. The whole order, with the excep-

Orchid (*Odontoglossum Rossi*).

tion of the comparatively few true terrestrial species, derive the most of their nutriment from the air, and seem to grow best attached to blocks of wood, or placed in baskets and hung from the roof of the greenhouse. They seldom need water at the roots, but require an abundant supply upon their foliage, particularly during their season of active growth. They need to be shaded from intense sunlight, but not from the ordinary light of the sun. *Odontoglossum Rossi*, of which we give an illustration, is an excellent variety for growing in baskets or on blocks in greenhouses. Its season of growth is during the summer, yet its magnificent flowers are produced in winter.

ORD, EDWARD OTHO CRESAP (1818-1883), an American general, was born in Allegheny co., Md., in 1818. His father, James, was an officer in the war of 1812. He graduated at West Point in 1839, and served against the Seminoles. He was on duty in California in 1847-49, and again in 1855. He was ordered to Harper's Ferry at the time of John Brown's raid in 1859. In 1861 he was made a brigadier-general of volunteers, and commanded a brigade in the Pennsylvania Reserves. He defeated Gen. J. E. B. Stuart at Drainesville, Va., Dec. 20, 1861, and was made major-general May 2, 1862. Being then placed in command of the left wing of Grant's army at Corinth, Miss., he took part in the battle of Iuka, and was wounded at Hatchie, Oct. 5, 1862. He commanded the Thirteenth corps at the siege and capture of Vicksburg and at the capture of Jackson. In July, 1864, he commanded the Eighteenth corps in the siege of Richmond, and was wounded at Fort Harrison, Sept. 29. In January, 1865, he relieved Gen. Butler of his command in Virginia and North Carolina, and commanded the Army of the James at Petersburg and in the pursuit and capture of Lee. When mustered out of volunteer service he was made brigadier-general in the regular army, July 26, 1866. He had military command of the States of Arkansas and Mississippi in March, 1867, and afterwards of the departments of California and of Texas. In January, 1881, he was placed on the retired list, and thereafter he lived in Mexico, his daughter having married the Mexican general, Trevino, in July, 1880. He died at Havana, July 23, 1883, while on his way to New York.

ORDNANCE. Before the invention of gunpowder, slings, javelins, bows, cross-bows, and rams were used as weapons, with which success largely depended upon the physical strength of the one using them, but the

gun came in as the great equalizer of mankind; with it the physically weaker became the equal of the physically stronger, and with it the reign of brute force came to an end. From the individual to the nation is but a step, and to-day all nations are actively engaged in providing themselves with suitable defences, as wars now must be short, and the nation best equipped and armed has a decided advantage.

An international war is now waging, wherein the rivalry is as intense as in the actual meeting of opposing forces. This war is carried on in the forge and machine-shop and not in the field, but the results are watched with the keenest interest, and the consequent progress in the destructive arts of warfare is most impressive. The recognition by Congress of the fact that the United States should have suitable land and naval defences has led in the last few years to liberal appropriations for guns, and, in the near future, guns equal in size and destructive efficiency to those of any other power will be produced in this country.

A brief description of the various classes of ordnance and their parts will aid the non-technical reader in following the progress of gun-making, as the beginning has already been made and guns turned out for the army and navy that warrant the belief that our guns when built will be second to none in the world.

Guns or heavy cannon are distinguished as rifled and smooth-bore; rifled guns having spiral grooves, which impart a rotary motion to an elongated projectile having projections or soft-metal bands, which enter the rifle-grooves. The smooth-bore gun has no grooves, and fires a spherical projectile. Guns are likewise distinguished as muzzle- and breech-loading, these terms explaining themselves, and as cast and built-up guns.

The breech of a gun is the mass of metal in rear of and around the bottom of the bore. The trunnions are cylindrical projections for supporting the gun on its carriage, placed on opposite sides of the gun in a horizontal plane, with the axes in the same line at right angles to the axis of the gun. The diameter of the bore is called the calibre of the gun. The chamber of the gun is that portion of the bore containing the charge. The vent is the channel from the exterior to the chamber through which fire is communicated to the charge.

There are two methods in general use of closing the after end of the gun when it is loaded from the breech: one by inserting a block into the bore from the rear, and the other by pushing in a block through a transverse opening across the bore. The former is in use in France, England, and the United States, and is known generally as the French system, though it is the outcome of an American patent of 1849, by Chambers, repatented in a different form by Schenck in 1853, and used in the construction of six guns for the English government, in 1855, at Boston, after the design of an American named Castmann.

The block is a cylinder of steel, upon which a screw-thread is cut, portions of the thread being cut away, leaving three blank spaces on the block running lengthways, and in the female-screw cut in the bore of the gun, into which the screw on the block is to engage, three similar blank spaces are left. The threaded portions of the block are brought opposite the corresponding spaces in the breech-screw, and then the block is forced in to nearly its full extent, and a sixth of a turn engages at the same time all the threads of the block with those in the breech. The same fraction of a turn back disengages the screw by bringing the threads of the block in the open spaces of the breech, and the block can be withdrawn. It rests on a bracket hinged to the side of the breech, so that it can be turned aside out of the way when the gun is loading. The vent is in the axis of the block, and escape of gas through it is prevented by an ingeniously arranged slide, which acts automatically as the breech is being closed, and prevents firing till the breech-block is in place.

With guns of large calibre where the breech-block is of great weight, it is turned, pulled out and drawn to one side by hydraulic, pneumatic, or steam power. The charge of powder is fired by means of a percussion primer which is struck by a spring lock, pulled from a distance of several feet by a string or lanyard.

A section of a breech-block is shown. The charge rests against a mushroom-shaped part, with a stem running through the block proper. To prevent the escape of the gas past the block a gas-check, or *obturateur*, is employed. This consists of a linen collar (C), filled with a mixture of 65 per cent. asbestos and 35 per cent. mutton suet, fitting snugly around

Gas-Check.

and just under the movable head. The collar is enclosed and protected by steel rings, maintaining the form of the plastic material. When the gun is fired the pressure upon the movable head is transmitted to the gas-check, which is forced out against the sides of the chamber, causing perfect obturation. The second method of closing the breech, known as the Krupp mechanism, is on the wedge plan. The breech of the gun is extended for a considerable distance in rear of the chamber, and a hole is cut through the gun horizontally, in which slides a cylindro-prismatic, or **C**-shaped breech-block. The plane-face slides across and closes the end of the bore. On this face a shallow circular recess is cut, and in it placed a thin disc of copper, over which is a steel plate. Against this presses a steel ring, with annular grooves at the back, which, expanding against the steel face of the plug and the walls of the bore, prevents the escape of the gas. This wedge is a modification of the invention of Mr. Broadwell, an American, and the gas-check ring is likewise his invention, and is called the Broadwell ring.

Mortars are short, heavy pieces of ordnance, with large bores, throwing shells at high angles, so that they may fall upon an enemy's ship or into his forts, and other places that cannot be reached by horizontal fire. Howitzers are light-shell guns firing large projectiles at low angles with small charges of powder. They are made both smooth-bore and rifled.

Machine-guns, while not strictly coming under the head of ordnance, will be described. These are guns with which rapid service is obtained by having the projectile and powder-charge put up as a cartridge, so that they need not be loaded separately. They are termed machine-guns, revolving cannon, and rapid-fire guns, the distinction between the first two and the rapid-firing gun being the same as between a revolver or magazine-rifle and a single-barrelled breech-loader, which must be loaded after every fire.

Guns are cast either solid or hollow; in the latter case cooled from the inside, and are then turned to the proper shape on the exterior and bored. The terms "built-up" and "hooped" are applied to guns wherein the gun is made in parts which are afterwards united by shrinking one part on another.

The latest English guns as well as our own are built on the system of Mr. J. Vavasseur, of England. The gun is composed of an inner tube of steel as thin as is consistent with strength, having a long jacket shrunk on to provide longitudinal strength, with layers of superimposed cylinders or hoops shrunk on, the number varying with the size of the gun. The general method of procedure is as follows:

The gun-tube, jacket, and hoops are obtained from the steel-maker, accepted only after the most rigid tests, rough-bored and rough-turned. The tube is turned to nearly the size required for receiving the jacket, then tempered in oil and then turned to the proper finish. The tube is then placed vertical in a pit, muzzle down, and water is pumped in to keep it cool. The jacket is then raised to a red heat, lifted from the furnace and lowered over the tube. Gas and water jets are employed for heating and cooling such portions as require it. When cold the gun is put in a lathe and the jacket turned for the first layer of hoops, and these are shrunk on in the same manner as the jacket, and after cooling are turned down for the next layer, and so on till all are in place. The gun is then finish-bored and ground, the trunnion band screwed on, the bore turned out, rifled, and the breech-screw cut.

Guns are also made of cast-iron bodies with wrought-iron and steel bands shrunk on to strengthen them. Cast-iron smooth-bore guns have been converted into rifles after various systems, the principal being those of Major Palliser, of England, and of Mr. Parsons, an American. In the former, after the gun has been bored out, it has inserted from the muzzle a tube consisting of two thin wrought-iron barrels, the outer a short one shrunk on at the breech end. The end of the tube is closed by a solid wrought-iron breech-screw. The tube is held in place by a screw-locking ring at the muzzle and a screw passing through the cast-iron just forward the trunnions. In the Parsons method of conversion the tube is made of steel having a solid breech, the tube being reinforced by jackets of steel shrunk on, the whole inserted from the rear end and a plug screwed in behind it.

Shell are projectiles filled with an explosive, such as gunpowder, generally fitted with a fuse which is intended to ignite the explosive. Fuses are arranged to explode the shell on striking or else are time-fuses, whereby, by means of a slow-burning composition which is set on fire by the blast of the gun, the time of exploding can be regulated. In spherical shells for smooth-bore guns a wooden sabot or block is fastened to the shell by iron straps so that the fuse is kept to the front.

Various methods have been employed to impart rotation to projectiles. Studs on the shell projecting into the grooves of the bore, lead coating, flanged rings on the base of the projectile, and the section of both gun and projectile made hexagonal, as in the Whitworth system, have all been tried. The best practice at present gives rotation to the projectile by means of a soft copper band forced into a score near the base of the shell, projecting about .07 of an inch beyond the sides of the shell. This band is forced into the grooves of the gun as the projectile passes along the bore.

Cast-iron shell are at present being made at the Washington Gun-Factory for the new naval guns, but determined efforts are being made to manufacture cast-steel shell. Chrome-steel forgings have been found satisfactory for 6-in. shell. Abroad forged and tempered steel shells are made which pass through armor plates or rebound with but little deformation.

Besides shell, guns fire case-shot, or a collection of small projectiles enclosed in a case, the principal case-shot being grape, canister, and shrapnel. Shrapnel are thin-sided shell containing a small bursting charge of powder, around which charge are placed a number of small balls embedded in sulphur. A grape-shot is composed of a number of small shot arranged around a spindle and held in place by discs. A canister is a metallic cylinder filled with balls, closed at the ends with wooden or metallic discs. The balls are packed in rosin or coal-dust and for smooth-bores in saw-dust.

Guns were first used by the English at the battle of Werewater in 1327. In 1346 guns were used at the battle of Cressy, where, guns being unknown to the French, the English were victorious. Portable firearms are supposed to be the invention of the Italians

about 1430. It is said that the Chinese made cannon of wood wrapped with silken bands. The early British cannon were cylinders made of iron bars held in place by hoops. Next large brass cannon were made firing stone projectiles weighing as much as 1000 pounds. Such cannon were used by Mahomet II. at the siege of Constantinople in 1449. These were followed in 1490 by small guns of brass and wrought-iron throwing cast-iron balls. One of these wrought-iron guns has been recovered from the wreck of the *Mary Rose* which went down during an engagement in 1545. These guns were composed of an interior tube of wrought-iron with a weld-joint in the direction of its length hooped with a number of wrought-iron rings, of 3-in. square section, put on when hot and allowed to shrink. They were loaded by removing the breech, as shown, putting in the charge and then blocking in the breech-piece against a heavy check securely fastened to the deck. From the same vessel cast-brass guns were recovered, one containing an iron ball. Cast-iron guns were introduced about 1558. The development of the gun from this time on remained practically in a state of stagnation till the beginning of this century, the guns then being but little superior to those in use at the beginning of the seventeenth century.

The guns mounted on the vessels of the United

Long Gun.

States during the war of 1812 were of three different types, all smooth-bore and muzzle-loading. The long gun was very thick and with a small bore compared with what was at that time an enormous length. The

Carronade.

long guns most in use were 6-, 9-, 12-, 18- and 24-pounders. The carronade was a short, light gun with a very large bore in comparison with its weight and length, and fired a heavier ball for a much shorter distance than a long gun of the same weight. The Columbiad was a smooth-bore gun about intermediate between the carronade and the long gun. Guns of the same calibre but of different types by no means correspond in power, but roughly a long 12-, a Columbiad 18-, and a 32-pounder carronade are equivalent.

These guns were mounted in two types of vessels, one with an open or uncovered gun-deck carrying generally long bow-chasers in parts forward and carronades along the sides. The other was the frigate type, with one covered deck and one open deck above, with guns mounted on both decks. The lower or main deck generally mounted long guns; the upper deck, carronades with two long bow-chasers. These guns were well fitted and the guns' crews were well drilled, and accidents to the guns were few, though the British carronades often upset in action, due to overcharging. While we had in this war heavier and better-fitted guns, the actual construction of our guns was not so good as that of the enemy's, and there were cases of failure leading to cracked muzzles or bursting. Our shot were deficient in density and so were less in weight

for the same calibre, the difference often being as much as 7 per cent.

The practice of firing shells from smooth-bore guns is said to have been suggested by the French General Paixhans as early as 1819, and introduced into the French navy in 1824. The introduction of shell fire with its great destructive effect upon vessels led to the introduction of armor, and the race between the gun and armor was begun and is still in progress with the gun well in the lead. (See IRONCLADS.) The problems that had to be met and solved in the working of metals for guns and armor have undoubtedly had a marked influence upon the development of every kind of metal work.

About 1840 the 8-in. shell gun came into general use in the United States, where it was called the Paixhans gun. This gun, which was practically the smooth-bore muzzle-loader of that date, employed in the same gun a smaller charge with the shell than with the shot; for example the 32-pounder using 6 lb. charges with shell and 10 lb. charges with shot. Dahlgren modified the Paixhans type of gun by casting the gun of a considerably greater thickness than it retained in its final shape, and turning down the excess of metal to bring it to its proper dimensions. These guns externally are formed of fair lines without angles or projections, the thickness decreasing from the breech to the muzzle in

proportion to the pressures of the powder gases in the interior. The chamber is conical, rounded at the bottom, and the vent is inclined to the axis. Dahlgren guns were built of 9-, 10-, 11-, and 15-in. calibre, but the charges were kept very low. During the civil war the charge of the 15-in. was usually 35 lbs.,

while at present charges of 100 lbs. are fired from this gun, with a 450 lb. shot, giving a muzzle velocity of about 1600 feet per second with very moderate pressures in the bore.

Rodman about 1849 suggested casting guns hollow and cooling them from the inside, and his system was adopted for large calibres in 1859, instead of the Dahlgren system of casting solid. His idea was to produce an initial compression changing gradually to tension from the interior to the exterior.

The adoption of the Rodman system followed the trial in 1849 of two 8-in. Columbiads cast at the same time from the same iron, one being cast solid and the other on the Rodman plan. The former burst at the 85th round and the latter after 251 rounds, and in later trials of other guns 1500 rounds were withstood without bursting. There are now a number of smooth-bore Rodmans available for land service, ranging from 8 to 20 inches in calibre. The 15-in. gun, firing a projectile of 450 lbs. with 130 lbs. of powder, has a range at 20° elevation of 3½ miles, and will pierce 10 inches of iron armor at 1000 yards.

Beginning in 1841, Prof. Daniel Treadwell, of Harvard, built a number of guns, joining end to end, by welding a number of short rings or hollow cylinders. The rings were first a ring of steel about one-third the whole thickness, over which a bar of iron was wound spirally. The breech was closed by a screw plug. His guns were tested by both the army and navy, the smaller calibres with very satisfactory results.

France introduced the first heavy rifled cast-iron muzzle-loader during the Crimean war. Rifling was first developed in small-arms. Barrels were grooved at Vienna to afford lodgment for the residue produced in firing and so diminish the friction in ramming home the ball, and by accidentally making these grooves inclined it was found that increased accuracy was given. About 1850 the rifle-musket came into use as a military weapon. Breech-loading small-arms have been rapidly developed in this country, such as the guns of Colt, Hall, Sharps, Burnside, Chaynard, and Spencer.

Rifling very soon made its way from small arms to cannon. In 1846 rifled breech-loading cannon were invented by Maj. Cavalli, of the Sardinian artillery, and by Baron Wahrendorff, of Sweden.

In 1854-55 William Armstrong (*q. v.*) built a rifled steel gun hooped with wrought-iron, which was tried with most satisfactory results. In the United States the Parrott rifle was brought out about 1856, as a field-piece, and rapidly gained in favor, and was as rapidly improved till in 1862 it was the most powerful gun for weight and size in existence. The first guns of this

sorts for all calibres, the 8-in. gun was the only calibre of the converted muzzle-loaders which was adopted and manufactured for the service. Our forts were then and still remain constructed with casemates adapted to guns of about the size of the 10-in. Rodman, and the 8-in. rifles converted from these were the most economical guns that could replace them. Two hundred and ten such rifles were obtained by conversion, able to penetrate 8 inches of iron armor at 1000 yards, and these are now in service.

In the navy the xi-in. Dahlgrens were converted

Dahlgren Shell Gun on Marsilly Carriage.

type carried into action afloat were mounted on the New Ironsides in 1862.

The Parrott rifle is a cast-iron piece, strengthened by shrinking a coiled hoop or band of wrought-iron over that part of the body which surrounds the chamber. The rifle grooves are of the plain rectangular type about $\frac{1}{16}$ of an inch deep, the twist increasing to the muzzle.

The Merrimac in the fight with the Monitor carried two 7- and two 6-in. rifles reinforced at the breech by steel rings 3 inches thick shrunk on. These were built on the design of Lieut. John M. Brook, of the Confederate navy.

Guns of this kind, cast-iron hooped with wrought-iron or steel, were the first steps in the development of the modern all-steel built-up gun, and they naturally started men to thinking as to the ways in which existing cast-guns could be improved and made to stand heavier charges, and the various systems of conversion were brought out in consequence.

into 8-in. muzzle-loading rifles on the Palliser system, and a number of 100-pounder Parrott guns were converted into 80-pounder breech-loaders by lining them with steel tubes fitted with slotted screw breech-plugs. The breech of the 100-pounder is cut off at the base ring and the hoop removed. The gun is then bored from the breech to a short distance forward the trunnions, which is as far as the tube extends. The tube is then screwed in from the rear. The band is then replaced after being lengthened from 27 to 39 inches. The rifling of the forward part of the original bore is continued into the tube. A number of 60- and 30-pounders were also obtained by conversion.

These guns now form the rifled armament of most of the wooden naval vessels in commission, as none of the high-powered guns have been fitted to the old vessels. They are fairly accurate at short ranges, but naturally could not compete with high-powered guns, and they will be retired as the vessels carrying them are condemned.

Parrott Rifle.

About 1874 the idea of converting cast-iron muzzle-loading smooth-bore guns into muzzle-loading rifles took strong possession of this country, as there were a number of smooth-bore guns afloat and ashore that were of little good as they were.

The army experimented with a number of Rodman guns converted on the Palliser and Parsons systems, and later by modifying the Palliser system to the extent of making the muzzle inserted tubes of steel, and while it may be said to have given in general satisfactory re-

sults the navy department obtained from the army in 1878 a 10-in. muzzle-loading Parrott rifle and had it converted into a 9-in. breech-loading rifle. This has been fired with satisfactory results with a powder charge of 45 lbs. powder and 250 lbs. battering shell.

About 1859 the breech-loading system began to gain in favor in England, but the breech mechanism having given trouble in several actions a prejudice sprang up against the breech-loader, and from 1863 to 1865 heavy muzzle-loaders were gradually introduced. In

1870 the admiralty decided to mount 35-ton guns in turrets. These guns were then the largest in the world. They were made only 16 ft. long and were practically failures. As it became evident that long guns with enlarged powder chambers, firing slow-burning powder, developed greater initial velocity, accuracy, and power, and that long guns gave much trouble in loading from the muzzle, with the application in France and Germany of two successful methods of closing the breech, the breech-loading system gradually gained in favor again and by 1875 began to supplant muzzle-loading. The development from this time has been most wonderful. On account of a better understanding of the working of steel, a thorough investigation of the action of the powder gases in the gun, and the development of a slow-burning powder, generating a moderate and sustained pressure, instead of the violently explosive quick-burning powder, guns can now be made twice as powerful on the same weight as in 1875. Thirty years ago the largest projectile was 68 lbs. and the largest charge 16 lbs.; to-day the largest projectile is a ton, fired with half a ton of powder. The projectiles of the largest guns weigh more now than the guns with which the battles of the last century were fought. In 1874 steel 3-in. boat-guns were designed and built by the navy; four years later a 6-in. all-steel built-up rifle, and by 1882 the navy was practically committed to the steel built-up breech-loading rifle. The army, up to this time, has not been so fortunate, as special legislation has somewhat hampered that branch of the service, they having been forced by Congress to build cast-iron guns as well as other special types that, in the light of the experience of the rest of the world, could hardly be expected to prove successful. Those having charge of a certain class of work, such as the building of guns, are naturally expected to know all that is done by others and to profit by it, and they should be the judges as to what is best. Inventors have, it is true, been in several cases forced to go to other countries for recognition and aid, but ordnance bureaus cannot carry on experiments without money, and the annoyance caused by the horde of cranks always hanging about the technical bureaus is very great, so that it is not to be wondered at that occasionally an invention having merit is passed over. It would seem that the best policy to be pursued by the government in cases where it does conclude to aid an inventor would be to require bonds for the full amount of the outlay, and all expended to be refunded in case the results are not as promised.

In England the gun now building is the all-steel built-up gun. In France the army and marine artillery are still being supplied with guns of cast-iron lined and hooped with steel tubes; but the navy has abandoned cast-iron in favor of the all-steel gun. In Germany the main supply of artillery is drawn from the works of Krupp at Essen. The guns are of steel throughout, the gun being built up with hoops and tubes. The Russian guns are all-steel and have a thin lining tube which can be easily replaced, in addition to the usual tube and hoops.

More than 25 years ago Sir Joseph Whitworth advocated the all-steel gun, built-up for large calibres, and all nations are gradually coming around to his views, and it is not likely that the built-up steel gun will be supplanted by any other, its only rival being the wire-wound gun. The wire-wound gun was invented by Dr. Woodbridge as early as 1850. A 2½-in. gun was built at the Washington Navy-Yard in 1865 and tried by the army; 1327 rounds were fired from it with no injury to the gun, though the trunnion band broke loose. A 10-in. gun was built in 1872-6. When the difficulties attending a new system of construction as this are taken into account, this gun gave most promising results, though the gun parted longitudinally after 103 rounds, the charge increasing from 40 to 90 lbs. and the projectile from 343 to 395 lbs. Both the

army and navy have wire-wound guns in hand. These guns are composed principally of steel wire wound in successive layers upon a steel tube, introducing longitudinal bars between some of the layers. In a 10-in. gun building for the army the tube is cast-iron. The steel 10-in. gun for the army weighs 22 tons and has 30 calibres length of bore. The wire-winding extends from the breech to the muzzle. The steel tube extends entirely through the gun and the breech screws into it. Longitudinal bars form a cylinder about the tube extending about one-half the length from the breech.

Guns for the army and navy are under the charge of the ordnance department of the army and the bureau of ordnance, navy department.

The Chief of Ordnance of the Army is a life-position and is at present held by Brig. Gen. S. V. Benét. The Chief of the Bureau of Ordnance of the Navy is appointed by the President and confirmed by the Senate for a term of four years. He must be a line officer of the navy of a rank not lower than that of commander, and while acting has the relative rank of a commodore, if a captain or commander. The present Chief of Bureau of Ordnance is Capt. Montgomery Sicard, U. S. N.

For many years previous to the civil war the guns of the army and navy were supplied by private firms, the principal being the West Point Foundry, Cold Spring, N. Y.; the South Boston Iron-Works, Boston, Mass.; the Fort Pitt Foundry, Pittsburgh, Pa.; and the Tredegar Iron-Works, Richmond, Va. They were kept up by regular annual appropriations made for guns. The ordnance manufactured at these places was under the inspection of army and navy officers and compared more than favorably with that of the rest of the world. Upon the breaking out of the war the Tredegar works were seized by the Confederates, while other establishments than the above undertook the manufacture of guns, among them being the Reading Iron-Works, Reading, Pa.; the Builders' Iron-Foundry, Providence, R. I.; the Phoenix Iron Co., Phoenixville, Pa.; and the Ames Manufacturing Co., Chicopee, Mass.

Since the war the Fort Pitt Foundry has closed and the only private firms building guns are the West Point Foundry and the South Boston Iron-Works. At the former works a number of cast-iron smooth-bore guns were converted into rifles by inserting wrought-iron tubes, and several breech-loading rifle built-up steel guns have been assembled for the army and navy. At the South Boston Iron-Works several large cast-iron rifles and rifled mortars have been manufactured, a number of guns converted from smooth-bores to rifles, and two 8-in. and six 6-in. built-up steel rifles assembled for the navy.

The Confederate States in 1861, with the exception of the Tredegar Works, were almost destitute of appliances in the way of tools and machinery for the fabrication of ordnance; but during the war extensive works were built up, which, before the end of the war, supplied the navy and land batteries with all descriptions of ordnance. The ordnance works at Richmond supplied the armaments for the vessels in the James River, at Wilmington, and other places, as well as the carriages for the heavy navy-guns mounted in shore batteries, sending to New Orleans, alone, 22 heavy guns from May, 1861, to May, 1862. The only establishment where very heavy forging could be done was at Charlotte, N. C., and there shafts for steamers and wrought-iron projectiles were forged and finished and gun-carriages and other equipments built. At Selma there was a foundry where guns were specially manufactured for service against ironclads, supplying 47 guns for the defences of Mobile and 12 for the batteries at Charleston and Wilmington. The principal powder-mills were at Columbia, where excellent powder was made, and at New Orleans large quantities of ordnance stores, fuses, powder, and guns were manufactured.

The United States rested after the war and seemed content with converting smooth-bores into rifles, which were added to the smooth-bores already in our forts and vessels. The reports of the war and navy departments were but sorry reading for an American, and the guns upon which we relied for defence were, in other countries, already placed in museums as relics.

While we were resting others were working, and as happily our peaceful relations were not disturbed, we are in a position to profit by their experience, and if we keep out of a war for the next ten years we shall have defences suited to our national needs. The Vavasseur all-steel, built-up gun has practically been accepted as the best gun by both branches of the service, and Congress has wisely appropriated the necessary money. This step was not taken in the dark, but information of every sort bearing upon guns and gun construction was examined into. The principal sources of information were the reports of the board of the army, the gun-foundry board, composed of both army and navy officers, with Commodore Simpson as president; the fortifications board and the Senate and House committees on ordnance and warships. The gun-foundry board visited the works of noted gun-builders in Europe and presented a report of the greatest value recommending suitable sites, tools, and all apparatus for the manufacture of guns and the amounts necessary to carry their recommendations into effect. The board decided that all forged, tempered, and rough-bored and turned cast and forged material should be drawn from the private industries of the country, while the finish-boring and turning, the rifling, sighting, assembling of parts, should be done at government gun-factories, one each to be provided for the army and navy, located at the Watervliet Arsenal and the Washington Navy-Yard, respectively; large appropriations to be made for the purchase of material from the steel manufacturers, that they might be warranted in expending the large amounts necessary to buy plants for the special work required. The report of the fortification board appointed "to examine and report at what port fortifications or other defences are most urgently needed, the character and kind of defences best adapted for each with reference to armament," is most elaborate and fully covers the ground.

The whole matter was again gone into by committees of both houses, and, as an outcome of this, authority is given in the act approved Aug. 3, 1886, to use such portions as may be necessary of \$1,000,000, appropriated for armament of vessels, to manufacturing and purchasing such tools and machinery, or erecting such structures as may be required for use in the manufacture of such armament. This enabled the navy department to build up the Washington Navy-Yard as a gun-factory, and buildings have been rearranged and rebuilt, contracts made for tools and cranes, and in every way the work of construction pushed as rapidly as possible by the bureau of ordnance. When completed the Navy Gun-Factory, working ordinary time, will be able to turn out each year the following guns: 25 6-in., 4 8-in., 6 10-in., and 4 12-in., or a proportionate number of any given calibre. This yard is situated on the eastern branch of the Potomac and contains 42 acres. It is well situated as regards defence against a foreign fleet, and the sources of supply secure from destruction by an enemy. It has for several years been used exclusively as an ordnance yard, and, with meagre facilities, has turned out a number of high-powered, modern, all-steel, built-up rifles that have given results equal, and, in some cases, superior to the best guns of other nations. Carriages have been constructed for all the new cruisers recently completed and for the Miantonomoh's 10-in. turret guns. Cast-iron shells are also made here.

The navy department having the necessary appropriations, amounting to \$4,000,000, consolidated, in

the summer of 1886, in one advertisement all of its requirements for armor and gun-steel for ships of war then authorized, the steel to be of domestic manufacture, and gave an average of two years and a half in which to secure and deliver it, which covered the time necessary to procure a plant. This advertisement resulted in a contract with the Bethlehem Iron Co. under which a plant for the production of armor and gun-steel is being erected at Bethlehem, Pa. Such a result was most gratifying and a new and important industry is by this means domesticated, and we are no longer dependent upon other nations for heavy forgings for guns or armor for armored vessels. A similar policy was followed in the matter of secondary batteries of machine and rapid-fire guns, the navy department declining to make any purchases of Hotchkiss arms, unless they were manufactured in this country, and this was agreed to by the Hotchkiss company, and with the superior tools used in this country in the manufacture of arms the guns can be made and sold here as cheap as they are sold abroad to any foreign government.

The army has its principal arsenals at Watertown, Mass., at Watervliet, N. Y., and at Frankford, Pa., and small arms are made at the National Armory, Springfield, Mass. The gun-foundry board recommended that the work on the fabrication of heavy guns for the army be concentrated at the Watervliet Arsenal, and Congress has appropriated \$700,000 to carry this recommendation into effect, the expediency of making guns in government-shops having been recognized by Congress in the case of the navy. The appropriation for the gun-factory is very properly supplemented by large appropriations for gun-steel, guns, and carriages, so that the problem of supplying our forts with proper guns has been practically solved. The Watervliet Arsenal is situated at West Troy, N. Y., and comprises 109 acres. It has a river front of 1600 feet, half of which has a stone wall where vessels may unload. From the river it extends to the Erie Canal and to within 300 feet of the Delaware and Hudson River Railroad, with which an easy and inexpensive connection would afford direct communication with the Albany and Susquehanna, Rensselaer and Saratoga, Hudson River, New York Central, Troy and Boston, and Boston and Albany Railroads, affording abundant means for transportation for supplies and products, while the city of New York, 4½ hours distant by rail and 10 by water, can be drawn on for supplies of material and skilled labor of every variety. Even with the whole Atlantic coast commanded by an enemy's fleet, guns and carriages could be safely distributed to all exterior points of defence by interior roads.

The army has in its forts and arsenals:

Smooth-bores.....	1518
20-in. calibre.....	2
15-in. ".....	308
10-in. ".....	998
8-in. ".....	210
Parrott rifles.....	292
10-in. calibre, 300-pdrs.....	38
8-in. " 200- ".....	81
6.4-in. " 100- ".....	173
Converted from 10-in. smooth-bores to 8-in. rifles.....	210
Smooth-bore mortars.....	45
Total.....	2065

The above are all muzzle-loaders, the nine classes requiring 33 different kinds of ammunition, and are not by any means sufficient for the protection of our coasts.

A number of experimental rifles and mortars have been provided for by Congress since 1882, and these are being finished and tested as rapidly as possible, but in all likelihood the guns are not such as will be reproduced.

The fortifications board estimates that there will be required for the proper armament of our coast:

16-in. guns weighing 110 tons each.....	44
14-in. " " 80 " "	6
12-in. " " 50 " "	203
10-in. " " 27 " "	222
8-in. " " 13 " "	102
12-in. mortars.....	700
10-in. mortars.....	24

The rifled mortars have been found to give great accuracy in fire, it being possible at two miles to drop 50 per cent. of shells fired inside the horizontal area of a large ship.

Mortars were first used afloat in 1679, during the French attack on Algiers. Nelson used bomb-ships at the battle of Copenhagen, where they materially influenced the result. During the American civil war our mortar fleets performed most efficient service. In the civil war the mortars were all of the short smooth-bore variety, firing a spherical shell. A 12-in. muzzle-loading rifled mortar was built and tested by the army in 1885. A range of nearly 5 miles was obtained with 52 lbs. of powder and an elongated shell weighing 610 lbs., the elevation being 45° and the time of flight about 41 seconds. A breech-loading mortar of the same size was tried in 1887 and with 65 lbs. of powder and a 625-pound shell, the range was 5½ miles, with better results than with the muzzle-loader. The body, forming about two-thirds the entire weight, is of cast-iron, over which are shrunk two steel tubes extending from the breech to about ¾ the length. The weight is about 14½ tons.

It is proposed by the war department to place these mortars in sunken batteries, in groups of sixteen, so arranged that as many as desired can be fired in one direction, thus greatly increasing the chances of striking a vessel or other object.

The estimates of the fortifications board for the defence of 27 ports is as follows :

Land defences.

Masonry and earth-works.....	\$31,863,000
Armour.....	20,300,000
Structural metal.....	3,320,000

Armament.

Guns and mortars.....	28,554,000
Carriages.....	9,411,800

Floating batteries and armament..... 18,875,000

Submarine mines and adjuncts..... 4,354,000

Torpedo boats..... 9,720,000

Total.....\$126,377,800

This with a population of 60 millions is only \$2.10 a head.

The estimated cost to defend our coasts in 1840 was \$57,000,000, or \$3.35 a head, and then the valuation of property was \$4,000,000,000; while it is now probably over \$50,000,000,000. We see that the cost now is but little more than twice the cost of defences in 1840, when the most formidable line-of-battle ship cost \$500,000, while now the corresponding ship costs \$5,000,000; ships increasing tenfold in cost, while the defences against them only increase about threefold, and the value of the property to be defended is vastly greater.

The number of serviceable naval great guns, not counting those for the new steel cruisers built and building for the navy, is :

Smooth-bores.....	2204
20-in. calibre.....	8
15-in. ".....	76
11-in. ".....	357
10-in. " shell.....	12
10-in. " shot.....	21
9-in. ".....	1011
8-in. ".....	346
32-pdrs. ".....	378
Parrott muzzle-loading rifles.....	990
150-pdrs.....	28
100- ".....	267

60-pdrs.....	75
30- ".....	375
20- ".....	245
8-in. rifles converted from 11-in. Dahlgrens.....	50
Parrott breech-loading rifles converted.....	41
80-pdrs.....	9
60- ".....	27
30- ".....	5
Total.....	3285

Upon the new steel cruisers, armored vessels, and monitors there will be mounted 2 12-in., 24 10-in., 14 8-in., 102 6-in., and 2 5-in. steel breech-loading rifles. These guns and the vessels carrying them are actually completed or building, and the batteries of 8 new vessels, while not yet fixed, are provided for, and also a number of pneumatic dynamite guns.

Congress, March 3, 1883, appropriated \$20,400 for the purchase and completion of 3 cast-steel 6-in. guns, one of Bessemer, one of open hearth, and one of crucible steel. Such guns were advertised for and contracts were made for cast guns of Bessemer and open-hearth steel, costing \$3300 and \$5300 respectively. These guns, rough-bored and turned, have been delivered at the Washington Navy-Yard, where they will be machine-finished and then tried. Much interest is centred in this trial, and by the advocates of cast guns much is claimed, and their success is expected to stop the manufacture of the built-up gun. Happily, however, the manufacture of built-up guns is now on so secure a basis that the much-needed defence of the country will not be delayed by having to wait till this question is settled. It is probable, however, that if guns are cast it will not be above 6-in. calibre and the material a bronze lined with a steel tube.

The powder used in the guns mounted on our older vessels and in our forts is unsuited to the high-powered modern guns. A certain amount of German brown or cocoa powder was purchased abroad by the navy department for experimental purposes, and having given excellent results it was endeavored to have it reproduced in this country, and with great success. The Messrs. Du Pont & Co. have lately submitted samples which performed satisfactorily. The successful manufacture of brown powder in this country is of the greatest importance and renders us independent of foreign manufactures in obtaining the only powder at present suitable for use in high-power guns.

The Lyman-Haskell multicharge gun is a gun designed with a number of pockets along and opening into the bore. Charges are inserted in these pockets and in rear of the projectile, and being ignited successively by the inflamed gases of the breech charge following the passage of the projectile over the opening of each powder-pocket in the bore. A 6-in. gun made on this principle was tested at Sandy Hook in 1883-4. The gun weighed 25 tons, and was of cast-iron lined with a steel tube. It had four powder-pockets, loaded by pouring in powder from the exterior, the regular chamber charge being inserted through the breech. With a powder charge of 96 lbs. and a projectile weighing 71 lbs. an initial velocity of 2101 ft. per second was obtained. The ordinary built-up steel rifle weighing about 4½ tons develops an initial velocity of over 2000 ft. per second with a 100-lb. shell fired with 50 lbs. of powder.

The naval 8-in. breech-loading rifle is shown on next page.

This gun weighs 25,720 lbs. and is 264½ inches long over all. There are in the bore 32 rifle-grooves .05 of an inch deep. The rifling begins at the junction of the bore and powder-chamber, with a twist of one turn in 180 calibres, increasing to within about a foot from the muzzle to one turn in 30 calibres, beyond which the twist is uniform. The breech-block, weighing 314 lbs., is secured in place by a slotted screw and is fitted with a modified De Bange gas-check. A muzzle velocity of 2008 feet per second has been obtained with a 250-lb. shell fired with 113 lbs. of powder.

When it was decided to have eight-inch rifles among the batteries of the Roach cruisers, there were no plants in this country able to make the necessary forgings, so they were obtained in England from Charles Cammel of Sheffield and Sir Joseph Whitworth of Manchester, but we shall not have to depend on foreign manufacturers in the future, as there are a number of steel-works now prepared to furnish such forgings as may be needed.

As a rough approximation the range of a gun is taken as one mile per each inch of calibre, but this gives results under rather than over, as during the jubilee year of Queen Victoria a jubilee shot was fired from a 9.2-inch gun, with a muzzle velocity of 2360 feet per second, and during a time of flight of 61 seconds it passed over 12.3 miles on a measured range.

Naval 8-in. Breech-Loading Rifle.

The character of the latest guns designed for the army and navy is as follows:

Navy Guns.

Calibre.	Weight—tons.	Powder-charge—pounds.	Projectile.
5-inch		30	60
6-inch	4.80	50	100
8-inch	13.00	125	250
10-inch	26.00	250	500
12-inch	48.00	425	850
16-inch	110.00	1000	2000

Army Guns.

Calibre.	Weight—tons.	Powder-charge—pounds.	Projectile.
8-inch	13	100	290
10-inch	27	200	575
12-inch	48	350	1000
16-inch	115	800	2300

A 119-ton gun built by Krupp is said to have been fired 200 times and is still in good condition, and a gun

Gun-Carriages.—When the vast energy of a modern high-powered gun is considered, the design of a suitable gun-carriage will be seen to be a problem calling for great mathematical and mechanical judgment and application. The energy of recoil of a 100-ton gun is 60,000 foot-tons, sufficient to lift a vessel of 10,000 tons displacement six feet in the air, yet this vast energy is taken up without shock or damage to the vessel in less than five feet recoil.

The first carriages were simply fixed supports, followed very shortly by movable ones as larger charges demanded some recoil, the gun being fastened by straps or bands around the gun. Next trunnions were invented fitting in sockets on the sides of the carriage and permitting the gun to be elevated or depressed without moving the carriage, and soon trucks or wheels were put on the carriage to facilitate moving it about.

These carriages were at first made of wood and later on of iron. The Marsilly carriage is mainly used for our broadside smooth-bore guns in use now, the recoil being limited by a rope or breeching.

As the energy of recoil became greater it was necessary to allow the gun to move relatively to a fixed part of the carriage, and the carriage was made in two parts, one called the slide held against recoil by a pivot, and the other sliding on it called the carriage. Friction was set up between the carriage and the slide by means of plates on one part tightly compressed between plates on the other. As it was found that the

Central Pivot Carriage, 6-in. Breech-Loading Rifle.

weighing 139 tons is now building at Essen which will penetrate four feet of wrought-iron at the muzzle. Designs have been prepared at the Royal Gun-Foundry, Woolwich, for a 156-ton gun.

above method was uncertain in its action a hydraulic recoil was invented, by which a piston is fixed on one part, fitting into a cylinder on the other. On recoil the water is forced from one side of the piston to the

other through a pipe or through holes in the piston or sides of the cylinder, and the recoil gradually taken up. With large guns the piston is made in two discs, one turned by means of small projections that fit into spiral grooves in the cylinder. At the beginning of the recoil the holes in each disc coincide, but as one disc turns it gradually shuts off the holes in the other, and as the orifices are made smaller the resistance to the passage of water through them increases as the gun recoils.

The gun is run out again after recoil by power or by having the slide inclined, and the gun returns to its position before recoil by gravity. The gravity-return principle, it appears, was first used by Wahrendorff for his rifled gun.

The pneumatic carriage is an American invention by Mr. A. J. Powlett, of New York. A carriage was built for a 54-ton carriage, and tried by the army at Sandy Hook. It is a gravity-return carriage, in which the recoil was taken up by the compression of air in a cylinder which was attached to the slide, the piston being attached to the carriage. The training and elevating was done by compressed air working in pneumatic engines. The entire mechanism in this carriage is crude, and, while the results were not such as were promised, they were better than could have been expected with the carriage as it was, and were amply sufficient to warrant further trials, and the navy has contracted for an 8-in. gun-carriage, in which the recoil is to be taken up and the gun elevated, trained, and loaded by compressed air. A contract has also been made for four 10-in. gun-carriages for the monitor Terror. The entire arrangement is now different from the first carriage, and preliminary trials lately made at Sandy Hook with a small experimental car-

riage were such as to lead to the belief that the government will have developed by this contract on its completion an efficient carriage for use with guns of large calibre.

Machine-Guns.—In the invention of machine-guns and small-arms America has led the world, though in nearly all cases the inventor has had to go abroad to have his invention appreciated.

The Gatling-gun, invented by Dr. R. J. Gatling, an American, fires bullets with great rapidity. The gun most in use has 10 breech-loading barrels, each with its own lock, the barrels and locks revolving together about a common axis. The barrels are revolved by means of a crank, and as they revolve the several operations of loading, firing, and extracting the cartridge are carried on continuously. A feed-case, containing about 40 cartridges, is placed over the lock-chamber, and the cartridges fall into the proper receivers, and when it is empty another replaces it. The ordinary rate of firing is about 800 a minute. Fired with careful aiming at a target 19 ft. long and 11 ft. high, distant 1000 yards, 665 hits were made out of 1000 shots.

The Driggs-Schroeder rapid-fire gun is one of the most promising rapid-fire guns now offered. Great initial velocity, with corresponding great accuracy and penetration, is obtained with a lighter gun than with other guns of like type and calibre. Shots can be fired with the 3-pounder at the rate of 30 per minute.

The Hotchkiss revolving-cannon is also an American invention; resembling the Gatling somewhat on the exterior aspect, but differing entirely in interior mechanism, and firing a shell instead of a bullet. It consists of five barrels grouped around a common axis,

Fig. 1

Fig. 2.

Fig. 3.

Driggs-Schroeder Rapid-Fire Gun.

The breech mechanism is shown in the accompanying cut. Fig. 1 showing the breech closed, Fig. 2 the breech open, and Fig. 3 a section through the line *zz* in Fig. 1. To open *A*, till the point *d* passes from beneath the horizontal wall *ab*, when the toe of the cam *A* presses against the lower portion *E* of the breech-block, and forces the block downwards, *d* moving along the line *bc*. While this is being done the bottom of the grooved recess *E* in the cam takes against the cocking-lug *h* on the firing-pin *C*, and forces it back against a spring until the full cock-stud *i* is caught by *l*, which happens just as the shoulder *g* on the block passes into the recess *f* on the cam. The ribs *XX* are now released from the grooves in the breech, and the bolt is in the upper part of the slot *D*. The block can now be turned down to the position of Fig. 2, being guided by the grooves *m*, into which project guide-studs *n* fixed in the breech. There are two extractors, one on each side, for withdrawing the empty cartridge-case. The gun is fired by means of a trigger, which draws *l* down to disengage *i*, which allows the firing-pin to spring forward.

which are revolved in front of a solid fixed breech-block. This block has an opening through which the cartridges are introduced, and another through which the cases are extracted. An important feature is, that at the instant of firing the barrels are still, and the mechanism is such that the loading, firing, and extracting take place during this pause. A cartridge is placed in the feeding-trough, which a piston pushes into a barrel; the barrel then begins to revolve, and the cartridge is carried on till it arrives before the firing-pin, which extends into the solid part of the breech, and which has been drawn back against a spring by means of a cam. When the cartridge is in the proper position the barrel ceases to revolve, the cartridge is struck by the firing-pin and discharged; then the revolution begins again, and the empty cartridge-shell is carried on till it comes to the extractor; another cartridge is by this time in the firing position, the barrels again cease to revolve, and the empty shell is withdrawn and dropped to the ground.

Shots from the gun firing a shell weighing 1 lb. will penetrate the sides of a torpedo-boat at the distance of $1\frac{1}{2}$ mile, and they can be delivered with great accuracy and rapidity.

Besides the revolving-cannon there are Hotchkiss rapid-firing guns, having one barrel only, wherein the cartridge is placed and fired by a trigger. This gun is of recent development, the United States being the first to order guns of this kind, the ones ordered being 6-pounders, 3-pounders, and 1-pounders, for the Boston, Atlanta, and Dolphin. The great advantage of having the charge, projectile, and firing-fulminate all in one case, so that the loading is all done at once, is so evident that there has sprung up a demand for large calibres, and the Hotchkiss company have extended the use of this fixed ammunition, as it is called, to 9-, 14-, and 33-pounders. These will penetrate at the muzzle 5.5, 6.7, 9.5 inches of wrought-iron respectively.

Another remarkable American invention is the Maxim automatic machine gun, which is loaded and fired by the energy of recoil of a preceding shot, loading and firing itself in fact after once being started, leaving the aiming only to be done. Smoke is consumed and the report muffled. The cartridges are placed side by side in a belt, and are fed into the gun by a bell-crank lever, one arm attached to the barrel and the other to a slide having two clutches projecting downwards. On recoil the clutches move to the right and engage a fresh cartridge, and the return of the barrel moves the cartridge into a position to be seized by a carrier. The first round is fired by hand, the gun recoiling opens the breech, withdraws a loaded cartridge from the belt, extracts the empty shell, cocks the hammers, compresses a spring which, when the recoil is at an end, forces the barrels back into the firing position, the return of the barrel expelling the empty case, pushing the loaded cartridge into the breech, closing the breech and pulling the trigger. This is truly a wonderful piece of mechanism, and the inventor is sanguine as to being able to apply the principle to large calibres.

The Maxim-gun has been built of a size to fire rifle-balls up to a 3-lb. shell.

The rifle-calibre gun is shown in Plate XL.

The outside of the gun is shown in Fig. 1, the fixed parts in firing are shown in full lines, excepting the crank A C B. The crank is part of the recoil system, the arm A coming into violent contact with the stationary arm D on firing. A by its shape moving up on D with a gradually increasing arc motion through about 150° , the most rapid motion being when the toe of the arm D bears against the lower part of A, the rotary motion being stopped by the arm B taking against the spring-buffer E. The spiral-spring F, shown dotted, is in a box on the left of the gun-casing. The spring is extended one inch by the recoil, and the chain G is wound up a little at its after end by the revolution of the shaft, still further extending the

spring. When the handle B is stopped by E the spring tends to bring all parts back to the firing position, the part H, which stops the crank-handle, being so made as to stop all rebound.

I shows the sights, K the feed-box, L the trigger.

A central longitudinal section is shown in Fig. 2, the parts being in the firing position.

The lock consists of a firing-pin *a*, a main-spring *b*, a hammer *c*, and a catch *e*, all mounted in the detachable belt N N N. When the trigger L is pulled the rod O is drawn back, and with it the lower end of the catch *e*, this movement of the catch releasing the hammer, the main-spring throwing the firing-pin forward, striking the cartridge and exploding it. Fig. 3 shows the parts when the breech is closed, Fig. 4 the parts when at the end of recoil. Figs. 5 and 6 are sections corresponding to the outside views of Figs. 3 and 4, and Fig. 7 is a perspective view corresponding to Fig. 4.

The limit of recoil of the barrel is one inch, but at the beginning of recoil the shaft C and the crank R begin to rotate, and all other movable parts are thus drawn away from the barrel. The sliding-piece T has an undercut groove on its forward face which fits the head of a cartridge, and in this way serves the double purpose of a breech-closure and a carrier to transfer cartridges from the belt to the gun. As it moves away from the barrel it withdraws the empty cartridge-case from the bore and a loaded cartridge from the belt, and, as its motion to the rear continues, it passes from the guides that sustain it and drops, partly by gravity and partly by means of a spring, into such a position as to bring the loaded cartridge into line with the barrel and the empty case into line with the discharge-tube P. The hammer is cocked through the motion of the crank R bringing the connecting-rod S in contact with the hammer-extension *S*. The spring brings all parts back into the firing position, as shown in Fig. 3. The empty and full cartridges are pushed into the proper places, the carrier is lifted by the arm U and the bell-crank V, the bell-crank being of such shape that the lifting takes place after the cartridge has been thrust home, while the movement of the connecting-rod releases the safety-catch *f*. Now if the pressure be continued on the lever *g* the gun will again fire, and continue to do so as long as the pressure lasts and the ammunition is supplied.

A safety-catch is fitted, which, when turned out as in Fig. 2, makes it impossible to pull the trigger.

The cartridges, which are placed in a belt, are fed into the gun by a bell-crank lever, one end fastened to the barrel and the other to a slide having two fingers extending downwards. When the barrel recoils these fingers move to the right and take hold of a cartridge, and, on the return of the barrel, move the cartridge so that it can be taken by the carrier.

At a recent official trial conducted by the Austrian government an average rapidity of 600 rounds per minute was obtained, while the gun was being pointed in every direction permitted by the mounting. In all, 13,504 rounds were fired, and the gun behaved remarkably well, the loading and firing mechanisms working faultlessly. The barrel is surrounded by a water-jacket, to keep down the heat, holding water sufficient for the firing of 1000 rounds in rapid succession. The water can be at any time renewed in 20 seconds.

Mr. Maxim has built a rapid-firing gun wherein the loading only must be done by hand. When fired, the barrel recoils through a distance of 4 inches, the breech remaining closed. The return to the firing position drops the breech-lock, cocks the hammer, and extracts the empty case. The insertion of the cartridge brings into operation a mechanism for closing the breech. Mr. Maxim has patented also a dynamite gun in which an explosive mixture is used to expel the projectile. The projectile is first started by a mixture of air and a volatile hydrocarbon under pressure, and when the projectile has passed over a little more than one-quarter

the length of the bore a detonating cartridge is exploded, exploding in turn the mixture of gases, increasing the pressure about eight times.

The pneumatic torpedo-gun, firing dynamite shells by using compressed air instead of gunpowder, invented by Capt. E. L. Zalinski, Fifth artillery, U. S. A., bids fair to take a most important place in future warfare. This gun is subject to much adverse criticism, and because termed a gun it seems to be the impression that this weapon should at once demonstrate its power to take the place of all other guns. This it cannot do; it has its own place, and that a most important one. Its fire is more accurate than that of the mortar and the destructive effect of the shell superior to that of the torpedo. The torpedo can hardly be considered efficient at more than 350 yards, while this gun throws charges 2 miles.

A 2-in. gun was first built and, giving satisfaction, a 4-in. gun was built in the spring of 1884 and tried in December of the same year, showing conclusively that shells containing high explosives could be thrown with safety upwards of 2000 yards. In August, 1885, an 8-in. pneumatic gun was completed and mounted at Fort Lafayette. This gun has been fired a number of times with satisfactory results. Six shots were fired Sept. 20, 1887, at a government schooner called the Silliman, resulting in the total destruction of the vessel,

drawn from those to restore the pressure in the firing reservoir. Compressed air is furnished by means of some standard air compressor, the Norwalk machine having been used so far. The shell is made of seamless brass as light as is consistent with strength. It is kept in the proper trajectory by means of a tail tube to which are attached spiral vanes, and it is centred in the bore and kept from metallic contact with the same by means of pins in the head, by a leather gas-check at the rear end of the cylindrical part, and by projections rivetted to the spiral vanes of the tail. The conical point is made strong enough to resist crushing from impact with the water, but so thin as to readily crush when striking a solid target. The charge in the shell is uncumphorated explosive gelatine with a core of dynamite. Handled as carefully as gunpowder, there is practically no more danger of accidental explosion.

A very ingenious electric fuse is fitted to the shell, so arranged as to explode after striking a target or descending below the water, a current being started by wetting the elements of a battery carried in the shell. The dynamite cruiser Vesuvius will carry three of these guns, of 15-in. calibre, placed abreast and parallel at a fixed angle. They are about 55 ft. long and will throw shells containing 600 lbs. of explosive gelatine to a distance of a mile. Thirty charges are carried. The guns can be loaded by hydraulic machinery

Fifteen-Inch Dynamite Gun.

four shells landing in practically the same spot at a range of 1613 yards. Three 15-in. guns are now completing for the dynamite cruiser Vesuvius, and a 15-in. gun for the Italian government.

The gun-barrel consists of a long tube of brass or other metal. The breech mechanism is a simple gate arranged so that the valve mechanism cannot work till the breech is properly closed.

A complete and accurate control of the range is obtained by regulating the amount of compressed air admitted in rear of the projectile, and without a change on the elevation or pressure. The valve admitting air is a balanced valve whose opening and closing is regulated, and in addition to this the air can be throttled on its way from the reservoir to the valve, so that though the valve may open and close in a uniform time, the amount of air passing into the gun in that time can be varied. As this can be regulated to a hair's breadth with great rapidity, the range can be better regulated for a moving target than by changing the elevation of the gun.

The compressed air is contained in wrought-iron reservoirs from 12 to 16 in. in diameter and about 18 ft. long. The reservoir tubes from which the air is drawn directly for firing are called the firing reservoirs. When a large number of rounds are required to be fired with great rapidity an auxiliary storage reservoir is used, charged with air compressed to twice the pressure to be used in the gun. After each discharge the air is

as rapidly as twice a minute. The vessel has twin screws and will develop a speed of 21 knots, or about 25 miles an hour.

In the preparation of this article the following publications have been freely used: *The Development of Armor*, by E. W. Verey; the Publications of the Intelligence Office of the Navy; the Reports of the Fortifications Board, and of the Chiefs of Ordnance of the Army and Navy; Roosevelt's *Naval War of 1812*; Scharf's *History of the Confederate States Navy*. [L. N.]

OREGON, one of the Pacific States, occupies but

See Vol. XVII, a small portion of the territory once included under its name. It then denoted all the land north of 42° N. lat. and between the Rocky Mountains and the Pacific Ocean.

The word is said to occur first in Capt. Jonathan Carver's *Travels through the Interior Parts of North America* (1778), where it denotes a large river which that adventurer had heard the Indians of the upper Mississippi mention. The Missouri was probably intended, but Bryant in his *Thanatopsis* (1818) applied it to the river to which its discoverer, Capt. Robert Gray, had given the name of his ship Colum-

bia in 1792. John Jacob Astor in 1811 established a fur-trading station at Astoria on this river, but the post was sold in 1813 to the North-western Fur Company. Actual settlement by New Englanders began in 1832, and a Methodist mission to the Indians was planted in 1834 at Salem.

Great Britain however put forth claims to the "Oregon country" and the U. S. Government was remiss in repelling them until Dr. Marcus Whitman, a zealous Presbyterian missionary and promoter of immigration, crossed the mountains in the winter of 1842-43, and proved to the authorities at Washington the true value of the territory which they had almost allowed to pass under foreign control. The Oregon question was a prominent factor in the presidential contest of 1844, the Democratic party insisting on extending the claim of the United States as far north as 54° 40' N. lat. President Polk's administration, however, compromised with the British government on the extension of the boundary of 49° N. lat. to the Pacific. After the acquisition of California by the Mexican war, Oregon Territory was organized in 1848. Its limits were reduced in 1853, and in 1859 it was admitted as a State.

Population.—Oregon at its admission to the Union had a population of about 50,000. The State census of 1885 gave it a population of 204,051, not counting 4220 Chinese. In this census the population of Baker county is estimated at 7000, the records of the actual enumeration having been destroyed by the burning of its court-house. The State has received a new impetus since the completion of the Northern Pacific Railroad in 1883. Three new counties have been organized, Malheur, Morrow, and Wallowa.

Finances.—The gross value of the property in the State in 1887 was \$120,635,706. The State tax-rate for general purposes is 49 cents on each \$100, for militia 2 cents, and for the State University 1 cent. The estimated expenditures for 1888 were \$482,709, against which there was a balance in the treasury of \$71,755.

Education.—The school age in Oregon is from 4 to 20 years. The following table gives the educational statistics of 1887:

	Males.	Females.	Total.
Persons of school-age.....	44,691	42,526	87,217
Enrolled in public schools.....	27,183	25,842	53,025
Average attendance.....	18,973	18,433	37,406
Teachers.....	919	1,170	2,089
Average monthly pay.....	\$45.78	\$34.79	
School-houses.....			1,324
Enrolled in private schools...	2,505	2,429	4,934

In 1887 the public school system was extended to include the Kindergarten. The receipts from the school funds were \$669,935. The irreducible school-fund was \$1,059,409. There are in the State 8 colleges with 44 instructors and 809 students. The State University at Eugene City has 184 students enrolled with an average attendance of 110. It has over 40,000 acres of public lands, and an endowment of \$126,000, and the Legislature makes an annual appropriation of \$5000. In 1887 its expenses were \$18,285 and the income \$21,511. The State Agricultural College at Corvallis was founded in 1870 by the Methodist Conference but received some support from the State. The Conference in 1886 transferred the property to the State, and the Legislature accepted it on condition that the friends of the institution erect suitable buildings. The corner-stone was laid in August, 1887, but the Conference of that year endeavored to recall the gift. This college had 5 instructors and 52 students, the annual expenditure being \$8470. It has 90,000 acres from the grant of the U. S. Government, and its fund in 1887 was \$99,015. There are normal-schools at Ashland, Monmouth, Drain, and Weston. Among the other educational institutions are 40 academies, a school for the blind, and one for the deaf and dumb.

The Penitentiary in September, 1887, had 267 convicts, being less than the average number. Of these

165 were engaged in foundry-work by contract, and 30 in brick-making. Their labor pays half the cost of their maintenance. The expenses for two years were \$57,172, and the receipts \$36,063. The Insane Asylum at Salem, built in 1881-83, half a mile from the penitentiary, cost \$144,000.

Railroads.—The Oregon and California Railway extends from Portland southward, passing through the Willamette Valley. It has a branch line from Albany to Lebanon. Its west side division runs to Corvallis; its east side division is leased to the Southern Pacific Railroad.

The Oregon Railway and Navigation Company extends from Portland to Huntington, on the eastern border of the State, 404 miles. It then joins the Oregon Short Line, which connects with the Union Pacific Railroad, to which company the whole is leased. The company has authorized the construction of 1300 miles of branch roads.

The Northern Pacific Railroad reaches Portland by a ferry at Kalama. Besides the foregoing through lines to the east and south, Portland has a narrow gauge road 80 miles long on the west side of the Willamette river, with some short branches.

Legislation.—At the election in June, 1884, the proposed constitutional amendment conferring the right of suffrage on women was rejected by a vote of 28,176 against 11,223. At the election in November, 1887, an amendment prohibiting the sale of liquor was submitted to the popular vote and defeated, there being 19,973 votes for it and 27,958 against it. At the same time the amendment to change the date of the State election, and another giving the Legislature power to fix the salaries, which are now prescribed by the Constitution, were both defeated. The registry-law for voters has been pronounced unconstitutional by the Supreme Court. In 1887 the Legislature set apart the first Saturday in June as Labor-day. It also strictly prohibited the sale or gift of opium, chloral, or cocaine except by physicians and druggists for cure of diseases. A State Board of Agriculture was appointed in 1885, and a State Fish Commission, State Railroad Commission, and Stock Inspector were appointed in 1887.

Statistics.—In 1885 there were by the State census 1,243,904 acres under cultivation; 373,247 cattle; 165,909 horses; 3591 mules; 202,612 hogs; 1,636,929 sheep. In 1887 the State Board of Agriculture reported the sheep at 2,593,029.

The State census of 1885 gave the following amount of agricultural produce: wheat, 8,933,718 bus.; oats, 6,247,300 bus.; barley and rye, 1,694,614 bus.; hay, 377,822 tons; corn, 273,497 bus.; butter and cheese, 3,287,923 lbs.; flaxseed, 14,262 bus.; tobacco, 13,207 lbs.; hops, 2,547,378 lbs.; potatoes, 2,650,284 bus.; wool, 9,165,830 lbs.; apples, 2,005,373 bus.; plums and prunes, 150,306 bus. There were 169,135,726 ft. of lumber cut in that year.

The mineral products for the year 1885 were 29,600 tons of coal, and 14,965 oz. of gold; the latter is probably less than the actual amount obtained, as many miners do not report.

The county reports to the secretary of state in 1887 gave the following statistics. There are altogether 5,874,668 acres of land, valued at \$34,091,141. The horses and mules are valued at \$6,185,037; cattle, \$6,059,134; sheep, \$2,504,888; swine, \$184,187.

The salmon fishery is one of the most important interests of Oregon. Its growth is seen in the following table:

Year.	Boats.	Cases.	Price.
1866.....	2	4,000	\$16.00
1870.....	50	150,000	9.00
1875.....	300	375,000	5.60
1880.....	900	530,000	4.80
1883.....	1700	629,000	4.80
1884.....	1700	629,000	4.80
1885.....	1600	553,800	5.00
1886.....	1500	448,500	5.30
1887.....	1400	379,000	5.96

The fishery is thus seen to have reached its height in 1883 and to have since declined. The State Fish Commission is expected to devise restrictions against the excessive capture of fish, which threatens to destroy the business.

For further information see *Resources of the State of Oregon*, prepared by the State Board of Agriculture and published by the State (Salem, 1888). (J. C. M.)

O'REILLY, JOHN BOYLE, poet and journalist, was born at Dowth Castle, county Meath, Ireland, in 1844. He became a reporter for English papers, but in 1863 enlisted in the Tenth Hussars, for the purpose of propagating Fenianism. He was detected, convicted, and sentenced to penal servitude for twenty years. After spending some time in English prisons he was, in 1867, banished to Western Australia. From this land of exile, in 1869, he departed at night in an open boat with a single companion without food or drink. After three days' exposure to the perils of the sea he was taken aboard an American whaler. He was carried to Liverpool, and thence quickly made his way to the United States. In 1870 he became connected with the *Boston Pilot*, of which he is now editor. He has published *Songs of the Isles*, *Moondyne*, and other books.

ORELLANA, FRANCISCO (c. 1500-1549), a Spanish explorer, was born at Truxillo about 1500. He took part in the conquest of Peru in 1531, and in 1540 was second in command of Gonzalo Pizarro's expedition to the east of the Andes. While descending the Napo, their provisions became exhausted, and Pizarro sent Orellana with 50 men in a brigantine down the river to procure a supply. Orellana reached the Amazon in three days. Finding the country entirely different from what he expected, and judging the return too difficult, he determined to sail down the main stream. In seven months he reached the mouth, having frequently been attacked by the natives. On returning to Spain in 1541 he told of a country inhabited by women warriors. Obtaining a commission to conquer and colonize El Dorado he organized an expedition, which proved very unfortunate. After entering the Amazon he died of a fever.

ORELLI, JOHANN KASPAR (1787-1849), a Swiss philologist, was born at Zurich, Feb. 13, 1787. He graduated at the university of that city and studied theology. While pastor at Bergamo he preached in German, French, and Italian. In 1813 he became a teacher of classics at Coire, and in 1819 was made professor of hermeneutics and rhetoric at Zurich. He died there Jan. 6, 1849. His editions of Cicero, Horace, and Tacitus are of special merit. He published also *Onomasticon Tullianum* (3 vols., 1836-38), and *Inscriptionum Latinarum Selectarum Collectio* (2 vols., 1828).

ORGAN. This article is confined to organ-building in America. The art of organ-building in this country was until recent years in a rather crude state. Wm. M. Goodrich (1777-1833) was the first native organ-builder worthy of the name, although others were engaged in the business before him. The organ made by Edward Bromfield in Boston in 1745 was the first one built in this country. Thomas Johnston was also making organs in Boston soon after, and he was succeeded by Josiah Leavitt. Henry Pratt built a number of organs during the early part of this century. During this period, however, foreign organs, of which the importation had begun as early as 1713, were still in demand.

Goodrich came to Boston in 1799, and there followed his business until his death. He built his first organ in 1805, and had such success that, notwithstanding the existing prejudice against American work, but few organs were imported during this time. His brother Ebenezer, after working with him for some time, set up on his own account. Thomas Appleton, who entered William Goodrich's employ in 1807, subsequently also went into business for himself, first in part-

nership with Messrs. Hoyt and Babcock, and later alone. A little before 1830 the art of organ-building began to receive a new impulse. The brothers, Elias and George G. Hook, began business in Boston about this time, and soon took a prominent position among American manufacturers. In 1853 Wm. Nutting, Jr., established himself at Bellows Falls, Vt., and at the same time there were four large factories in Boston—Appleton's, Simmons', Hook's, and Stevens'. Up to this time, however, but few attempts had been made to improve either tone or mechanism of the organ. It was the interest excited by the erection of the excellent organ in the Music Hall, Boston, that did much to bring about a complete change of affairs. This large instrument, built by E. F. Walcker & Son, of Ludwigsburg, Wurtemberg, was begun in 1857 and finished in 1863. The American builders, having once recognized the necessity of producing better work, soon began to introduce many and important improvements, and it was not long before they could compete successfully with the European manufacturers.

Two of the best-known houses to-day are those of Roosevelt and Jardine, both of New York. Hilborne Lewis Roosevelt (1849-1886) began business in New York in 1872. He made some notable improvements in the art of organ-building. By his construction of the wind-chest each pipe has its own valve, actuated by compressed air. The "automatic adjustable combination" enables the player to place any required combination of stops under immediate control, and to alter such combination as frequently as desired. The electric action was first employed by Roosevelt in 1869, when he was with Hall & Labagh, of New York, and has subsequently been frequently employed. His brother Frank succeeded him in 1887. Among the numerous instruments built by this firm are those in Grace Church, New York (1878); Chickering Hall, New York; Cathedral of the Incarnation, Garden City, L. I. (1879-83), 106 stops; St. Thomas' Church, New York (1881-3), 56 stops; Church of the Incarnation, New York (1883), 50 stops; First Congregational Church, Great Barrington, Mass. (1883), 60 stops; Calvary Church, New York (1887); and the organ built for the United States Centennial Exhibition, now owned by the Massachusetts Charitable Mechanics' Association.

Mr. George Jardine (1801-1883), the founder of the house of George Jardine & Son, established himself in New York as early as 1836. He introduced various improvements, among which are the "pneumatic vacuum pallets." In 1860 he took his son Edward G. into partnership. This firm has also built a large number of instruments, notably those in the New York Cathedral (60 stops); St. George's Church, New York (80 stops); Brooklyn Tabernacle (70 stops); St. Agnes Church, Brooklyn (70 stops); Pittsburg Cathedral; Trinity Church, San Francisco; Mobile Cathedral; and Christ Church, New Orleans.

The firm of Hook & Hastings was founded by the brothers Hook in 1827. Mr. F. H. Hastings first engaged with them in 1855, became a partner in 1865, and now succeeds them. The principal instruments that have come from this factory are the organ in the Cathedral of the Holy Cross, Boston (1875), with 3 manuals and 83 stops; that in the Music Hall, Cincinnati (1878), 4 manuals, 96 stops; and that in Tremont Temple, Boston (1880), 4 manuals, 65 stops. Another well-known Boston firm is that of Hutchings, Plaisted & Co. It was founded in 1869 by J. H. Wilcox, George S. Hutchings, Mark H. Plaisted, and G. V. Nordstrom, all of whom had been previously connected with Hook & Hastings. The firm-name was at first "J. H. Wilcox & Co.," which, in 1872, was changed for the present name. These builders have erected organs for Christ Church, Baltimore, Md.; St. Peter's Church, Philadelphia; Old South Church, Boston; Church of Immaculate Conception, Lowell, Mass.; and numerous others. Other notable

organs in this country are those in St. Bartholomew's, New York, by J. H. & C. S. Odell; and Temple Emanuel, New York, by Hall & Labagh. Mention should also be made of the large organ in the Roman Catholic Cathedral at Montreal, the work of Samuel Russell Warren (1809-82) of that city, who formerly worked in Boston.

As in other arts, so too in that of organ-building, America has made great strides in advance, and in the production of such excellent instruments as those mentioned, our native builders have shown their ability to compete successfully with the best foreign manufacturers. (F. L. W.)

ORGAN, REED. It appears that instruments in which "free reeds" were used were made in this country quite early in the present century. Aaron Merrill Peasley, in 1818, obtained a patent for reed instruments; this patent is now in the possession of the Mason & Hamlin Organ and Piano Co. J. H. Bazin, of Canton, Mass., is also named as an inventor in this connection. The instruments manufactured at this time were, of course, imperfect and defective in construction. The earliest forms of an organ with free reeds and without pipes, the bellows being worked by the foot, were the "seraphine" and the "melodeon." The latter was first introduced about 1840, and two of the best-known firms engaged in its manufacture were those of Carhart & Needham, and George A. Prince & Co., both of Buffalo, N. Y. One form of this instrument, the harmonium, appears to have been invented by Debain of Paris, and improved by Alexandre, whose name it bore in this country. Until the introduction of the perfected reed organ, in 1861, the melodeon was very popular in this country, despite its faults, and, amongst others, the firm of Geo. Prince & Co., which dissolved in 1875, manufactured many thousands of these instruments. Jeremiah Carhart, about 1836, made several improvements, notably the plan of acting on the reeds by suction instead of blowing, which Peasley had spoken of in his patent. This is a characteristic feature of the American organ, the foreign instruments being still worked by force bellows. Carhart's partner, E. P. Needham, also made some improvements. But the most important improvement, and the one which has contributed greatly to the present perfection of these instruments, and their consequent popularity, was the discovery that by twisting and bending the reeds in various ways the quality of tone was greatly modified and improved. This discovery was made in 1848 by Emmons Hamlin, then a workman in the factory of Prince & Co. In 1854 he and Henry Mason, a son of Lowell Mason, began the business of the firm which in 1868 took the name of the Mason & Hamlin Organ Co. Under the inventor's eye this newly-discovered art of "voicing reeds" was carried to great perfection. In 1861 the firm first introduced the American cabinet or parlour organ in its present form. The excellent instruments produced by the firm have placed it in the foremost rank of American reed organ manufactures. The factories of the firm are located at Cambridgeport, Mass., and the home office in Boston, with branch offices in other cities, and agencies all over the world. The name in 1882 was changed to the Mason & Hamlin Piano and Organ Co. Another well-known firm is that of Jacob Estey & Co., Brattleboro, Vt. The business was begun in 1846, by two gentlemen, in a building owned by Jacob Estey. In 1852 the concern passed into the hands of Mr. Estey. The instruments of this firm are also well known in this country and abroad, and rank among the best. The firm of Wilcox & White, of Meriden, Conn., was formed in 1876. The business grew rapidly, and their organs are now favorably known the world over. Numerous other manufacturers are also engaged in this business in the United States. The many improvements which have been applied by American makers have resulted in producing an instrument

which is extensively used in foreign countries as well as in the United States. These organs are made in all styles and sizes, some of them even with two or three manuals, being then almost equal to small pipe organs in power and resource. The popularity which the instrument has attained through the improvements introduced is very great, and it has been estimated that there are now more than 80,000 cabinet or parlour organs, under various names, made and sold yearly in the United States alone, by about 250 makers.

(F. L. W.)

ORIOLE. The so-called orioles of America are, as is agreed by all systematists, of a family (*Icteridae*) quite distinct from the orioles of the Eastern Hemisphere. Our orioles are briefly noticed in the *ENCYCLOPÆDIA BRITANNICA* under the name *Icterus*. The important family *Icteridae* is strictly American, and is pretty closely allied to the starlings (*Sturnidae*) of the Old World. Among the Icterids, or American orioles, are grouped our blackbirds, bobolinks (*q. v.*), meadow-larks, cow-birds (*q. v.*), troopials, and grackles. The family is separated from the *Fringillidae* (finches, sparrows, buntings, etc.) by very obscure, if not intangible, distinctions; some of them, like the bobolink, or reed-bird, might almost as well be classed with the finches as with the *Icteridae*. On the other hand, some of the family approach pretty closely to the crows in many of their characters. The sub-family, *Icterinae*, contains those species more properly called orioles.

The most common North American oriole is *Icterus spurius*, the orchard oriole, or "bastard Baltimore bird," as it is sometimes unjustly called. This rather plain bird is found in all parts of this country and is well known for its beautifully-woven and somewhat pensile nest. The splendid Baltimore oriole (*I. galbula*) takes its name from the black-and-orange livery of the Calvert family, to which the Lords Baltimore belonged. The male is, as usual among birds, far more showy than his modest spouse. There is much difference, however, among the males of this species, some of which have a very gorgeous coloration, while others are comparatively plain. Among the popular names for this favorite are golden robin, firebird, fire hangbird, and hangnest, the last names bestowed from its well-known habit of constructing a bag-like, pendant, and well-woven nest at the extremity of some swaying branch. It is a persistent and noisy singer, with a monotonous tune.

Farther west this species is replaced by *I. bullocki*, Bullock's oriole, a larger but not dissimilar species. In the extreme South-west and on the Mexican frontier we find the hooded oriole (*I. cucullatus*) whose general coloring is orange of varying but showy tints, mixed with black. In the same region are found *I. parisorum*, the "Paris brothers' oriole," and the very large and handsome *I. melanocephalus*, the black-headed or Audubon's oriole. In Mexico it is highly prized as a cage-bird, and its singing is said to be remarkably fine. (C. W. G.)

ORR, JAMES LAWRENCE (1822-1873), statesman, was born at Craytonville, S. C., May 12, 1822. He graduated at the University of Virginia in 1842, studied law, and was admitted to the bar in 1843. He entered on practice at Anderson, S. C., where he edited a newspaper. In 1844 he was elected to the State Legislature, and in 1849 to Congress. While holding the abstract right of secession on the part of each State he long opposed its exercise as inexpedient. This position he maintained in the Southern Rights Convention at Charleston in May, 1851. He was chosen Speaker of the House of Representatives in 1857. After the election of Lincoln to the presidency he became an advocate of immediate secession, and as such took part in the South Carolina Convention in December, 1860. He was then appointed one of three commissioners to Washington to treat with the

Federal government for the surrender of the U. S. forts in Charleston harbor. Although not officially received by Pres. Buchanan, their mission was not without effect. After the Confederate government was formed, Orr was elected to the Senate and there remained till the end of the war. Acquiescing in the result he was made governor of South Carolina in 1866, and held that position till 1869. He was appointed U. S. circuit judge in 1870, and was sent as U. S. minister to Russia in 1873. He died at St. Petersburg, May 5, 1873.

ORTON, JAMES (1830-1877), an American naturalist, was born at Seneca Falls, N. Y., April 21, 1830. He graduated at Williams College in 1855 and at Andover Theological Seminary in 1858. After a year's travel in Europe and Asia Minor he became a Congregationalist minister. In 1866 he was made an instructor in natural science in Rochester University, and in 1867 he led the Williams College Expedition which explored the Upper Amazon. He was made professor of natural history in Vassar College in 1869. He made a second visit to the Amazon in 1873, and in a third visit to South America he died while crossing Lake Titicaca, Sept. 24, 1877. He published *The Andes and the Amazon* (1870); *Underground Treasures; How and where to find them* (1872); *Liberal Education of Women* (1873); *Comparative Zoölogy* (1875).

OSAGE ORANGE. This is the common title of *Maclura aurantiaca*, known also by the French title of Bois d'Arc, a tree native to the contiguous portions of Arkansas, Texas, and the Indian Territory, but which is coming largely into use as a hedge material in other States. It is extensively planted for hedges in the West, and to some extent in the East, and when kept properly clipped serves this purpose excellently. As a tree it attains a height of 50 feet and a diameter of 2 feet, being most common and prolific in the Red River Valley of the Indian Territory. Its wood is heavy, exceedingly hard, close-grained, strong, and flexible, of a satiny surface, and susceptible of a beautiful polish. Its color is a bright orange, which turns brown on exposure. It is very durable in contact with the ground, and is used largely for fence-posts, paving-blocks, railway-ties, and wheel-stock.

OSAGES, a tribe of American Indians of the Dakota family, were known in the seventeenth century as living on the Missouri and being allied with the Illinois. They are reported to have assisted the French against their hereditary enemies, the Foxes, in 1712, and some of their chiefs were taken to France in 1726. They continued to aid the French until the power of this nation was overthrown in America. Early in the present century they numbered about 6000, of whom the Great Osages resided on the Arkansas River and the Little Osages on the Osage River. By a treaty made Nov. 10, 1808, the chiefs ceded some of their lands, and the tribes afterwards repudiated the treaty. But as they were driven out by the whites, they engaged in warfare with the Cherokees and other tribes. Other treaties followed, and were no better kept than the first. They lived by plundering, and resisted all efforts to civilize or Christianize them. The border war in Kansas and the civil war had a disastrous effect upon them, since they sided with the Confederacy. After the war efforts were made to induce them to remove to Indian Territory. Finally this was effected in 1872, but they were deprived of their cattle and other property. When they were settled in their reservation, north of the Cherokee country and west of 96° N. lat., Pres. Grant, in carrying out his "Peace policy," assigned this tribe to the Society of Friends. Schools have been established and agriculture encouraged, with good effect. Capt. C. H. Potter reported them in 1887 as rich and indolent. They receive over \$35 quarterly per capita from the interest on the Osage fund. The number on the reservation was stated as 403 men, 399 women, 391 children; total, 1193.

OSCAR II., FREDERIC, king of Sweden and Norway, was born at Stockholm, Jan. 21, 1829. In his youth he served in the navy. He was educated at the University of Upsal, under the historian Carlsson, and travelled on the Continent. He succeeded to the throne on the death of his brother Charles, Sept. 18, 1872. He reorganized the army and the railroads. In 1873 he visited Norwegian Lapland, and in 1875 the emperors of Germany and Russia. He sent his son to travel through Europe and to visit the Centennial Exhibition at Philadelphia. King Oscar has fine literary taste, and has published translations of Goethe's *Faust* and *Tasso*. He is also the author of a sketch of Charles XII. and of a volume of poems.

OSCEOLA (1804-1838), Indian warrior, was born on the Chattahoochee River, Ga., in 1804. His name means "Black drink," and was given to denote his courage, as shown by his drinking that nauseous mixture. He was the son of William Powell, an Englishman, by an Indian mother. Early distinguished in the dances, games, and athletic exercises of the Seminoles, he gained great influence in the tribe, and opposed the cession of its lands in Florida. His wife was the daughter of a fugitive slave, and in 1835 was herself seized as a slave. Osceola then demanded her return from Col. Thompson, the U. S. agent at Fort King, but the latter, resenting his language, ordered him to be confined in irons for six days. In December, six months later, Osceola avenged this injury by killing Thompson and others. He then entered upon a vigorous warfare against the whites, massacred Maj. Dade and his command, and fought Gen. Clinch at Withlacoochie. He also had several encounters with Gen. Gaines, and made attacks on Forts Micanopy and Drane. At last, while holding a conference with Gen. Jesup under a flag of truce, near St. Augustine, Oct. 22, 1837, he was treacherously seized, and was thereafter imprisoned at Fort Moultrie, S. C., where he died Jan. 30, 1838.

OSGOOD, FRANCES SARGENT (1811-1850), poet, was born at Boston, June 18, 1811, being the daughter of Joseph Lock, a merchant. She attracted the notice of Mrs. L. M. Child, and contributed to her *Juvenile Miscellany*. In 1835 she was married to Samuel Stillman Osgood, a portrait-painter, with whom she visited London. There she contributed to periodicals, and published *A Wreath of Wild Flowers from New England* (1839) and *Elfrida*, a drama (1839). After her return to Boston she published *The Poetry of Flowers* (1840) and *The Floral Offering*. A complete collection of her poems appeared in 1849. She died at Hingham, Mass., May 12, 1850. A *Memorial* by R. W. Griswold was published in 1851.

OSHKOSH, a city of Wisconsin, the county-seat of Winnebago co., is 85 miles N. W. of Milwaukee, on both banks of the Fox River, which here expands into Lake Winnebago. The lake is 30 miles long and from 12 to 15 miles wide, and with the Fox and Wisconsin, which are connected by a short canal, forms a water-route between Lake Michigan and the Mississippi. Oshkosh has a lake frontage of nearly 4 miles, towards which its surface slopes gradually, giving excellent drainage. The Fox River is spanned by 3 wagon-draw-bridges and 3 railroad-bridges. Four railroads pass through the city. Oshkosh has a U. S. government building, a fine city-hall, county court-house, Masonic temple, exposition building, 2 opera-houses, and other buildings of attractive architecture; 24 church edifices, a State normal school, a high-school, a business college, 8 public schools, and 8 private and parochial schools. There are 5 hotels, 2 national banks, 1 State bank, 2 daily and 4 weekly newspapers. The chief industry is in lumber, logs being floated from the northern pineries down Wolf and Fox Rivers. There are about 15 large saw-mills at Oshkosh, and factories which produce one-tenth of all the doors and sashes made in the United States. There are also several large furniture-factories, 4 extensive carriage-factories, the largest

match-factory in the world, 3 foundries and machine-shops, 3 soap-factories, several pork-packing houses. The business portion of the city is built chiefly of brick. The streets are lighted by electricity, but gas is used by private consumers. The water is supplied by the Holly system from a cluster of artesian wells. The assessed valuation of property is about \$8,000,000. The bonded debt is \$143,000, and the yearly expenses exceed \$200,000.

This locality was traversed by the early French explorers and missionaries, but the first permanent white settlement was made by New Englanders in 1836. The city was incorporated in April, 1853. In 1859 the entire town was destroyed by fire; in 1874 the extreme northern portion was swept away, and in the next year all of the city north of Fox River was consumed, the loss being about \$3,000,000. In 1885 part of the suburbs was destroyed by a cyclone. The population in 1880 was 15,748, and in 1888 it is estimated at 25,000. (C. W. B.)

OSKALOOSA, a city of Iowa, county-seat of Mahaska co., is 60 miles east of Des Moines, on the S. W. branch of the Chicago, Rock Island, and Pacific Railroad and the Central Railroad of Iowa. Oskaloosa is at the centre of the Iowa bituminous coal-fields. It has a fine court-house, which cost \$150,000, an opera-house, 4 hotels, 2 national banks, 2 other banks, 1 daily and 3 weekly newspapers, 9 churches, 5 schools, and 3 colleges. The industrial works comprise 2 foundries, electric manufacturing, boiler-works, bridge-works, and flouring-mills. The city is lighted with gas and electricity, and has a park and water-works. Its property is assessed at \$1,200,000, but is worth four times as much. The public debt is \$45,000, and the yearly expenses about \$21,000. Oskaloosa was settled in 1844 and incorporated in 1848. The population in 1880 was 4598, but now exceeds 7000.

OSMAN PACHA, a Turkish general, was born at Tokat, Asia Minor, in 1832. Having been educated at the military school at Constantinople, he entered the cavalry in 1854, and served under Omar Pacha. In 1860 he was engaged in Syria and in 1867 in Crete, where he became lieutenant-colonel. In 1874 he was made brigadier-general after taking part in the expedition to Yemen. He was afterwards placed in charge of the operations against the Servians. After the Russians in 1877 had crossed the Danube, Osman Pacha defeated their Ninth corps near Plevna, and then thoroughly fortified that city. On Sept. 14th he repulsed the Russian besiegers with a loss of 20,000 men. On Dec. 10th he made a gallant but unsuccessful effort to break through the Russian lines. Being wounded he was obliged to capitulate, surrendering 40,000 men and 400 cannon. His skilful conduct of the siege had given him fame as an engineer and commander. After the war, in March, 1878, the reorganization of the Turkish army was entrusted to him. He was made minister of war, commander of the imperial guard, and chief of the artillery. His influence with the sultan was, for a time, very great in spite of the jealousy of other ministers, but in 1880 he resigned and retired to private life.

OSWEGO, a city of New York, county-seat of Oswego co., is on the S. E. shore of Lake Ontario, at the mouth of the Oswego River, here crossed by three iron bridges. It is 35 miles N. N. W. of Syracuse, with which it is connected both by railroad and canal. Its site is elevated, and towards the south there is a bluff rising 160 ft. above the lake. The principal edifices are the U. S. government building, court-house, city-hall, the State armory, and some churches. Oswego has 5 national banks besides other banks, 20 churches, normal, training and graded schools, 2 daily and 3 weekly newspapers. It is the chief port on Lake Ontario, and has a large breakwater, 4 miles of wharves, and 12 grain-elevators. Grain and lumber are the chief imports and coal, flour, and salt the exports. Within the limits of the city the Oswego

River has a fall of 34 feet, and there are 6 dams to assist the canal navigation. The abundant water-power has rendered Oswego a noted manufacturing city. The starch-factory is the largest in the world, occupying 10 acres of ground and having buildings seven stories high. There are also flour-mills, iron-foundries, machine-shops, ship-yards, car-shops, knitting-mills, etc. Fort Oswego was built in 1727, and was noted in the French and Indian war. In 1814 it was captured by the British. In 1828 the village was incorporated, and in 1848 it was made a city. In 1880 its population was 21,116.

OTIS, HARRISON GRAY (1765-1848), Federalist, was son of Samuel Alldyne Otis (1740-1814), who was secretary of the U. S. Senate from 1789 to 1814, and nephew of James Otis (for whom see *ENCYCLOPEDIA BRITANNICA*). He was born at Boston Oct. 8, 1765, graduated at Harvard College in 1783, and was admitted to the bar in 1786. He served in the State Legislature and in Congress. In 1801 he was appointed U. S. district attorney for Massachusetts, but soon re-entered the State Legislature and presided in turn over each branch until 1811. With his party he opposed the war with England, and he took a prominent part in the Hartford Convention, of which he afterwards published a *Defence* (1824). Meantime he had been a judge of the court of common pleas and in 1818 had been again elected to Congress. His last public service was as mayor of Boston in 1829, but he lived nearly twenty years longer, and died in that city Oct. 28, 1848.

OTTAWA, a city of Illinois, county-seat of La Salle co., is at the confluence of the Fox and Illinois Rivers, 82 miles S. W. of Chicago, on the Chicago, Rock Island, and Pacific Railroad, and on a branch of the Chicago, Burlington, and Quincy Railroad. There are three bridges across the Fox River and two across the Illinois, besides the bridges over the Illinois and Michigan Canal. The city has a State Supreme court-house, a county court-house, 2 national banks, 7 weekly and 2 daily papers, 6 hotels, 12 churches, 8 schools besides the high-school, and the Reddick Library. The abundant supply of white sand in the vicinity gives facilities for glass-making, there being 6 furnaces, one of which produces the Bastie lamp-chimneys. There are also tile-works, fire-proofing-factories, flour-mills, a foundry, and manufactories of agricultural implements, wagons, organs, and pianos. Ottawa is beautifully situated on a level plateau about 30 ft. above the river, has excellent drainage and an abundant water supply, both from a natural reservoir formed by a gravel bed on the south side of the city and from numerous artesian wells. These wells, having an average depth of 350 ft., give a supply of 50 gallons each per minute. The analysis of the Ottawa mineral spring, by Prof. Benjamin Silliman, showed it fairly equal in bromine and iodine to the Saratoga Springs. Ottawa was settled in 1830, incorporated in 1838 as a village and in 1853 as a city. It is lighted with gas and electric light. Its property is valued at \$1,250,000, and its city debt is \$17,500; the yearly disbursements are about \$50,000. Its population in 1880 was 7834.

OTTER. Concerning the North Pacific sea-otter, *Enhydra lutris*, it will be sufficient to See Vol. XVIII. add that their furs at present command an exceedingly high price, the principal market or port for their collection and shipment being the little town of Belkofsky in Alaska, though considerable numbers are taken in some years much farther to the south.

The most common otter of North America is *Lutra canadensis*, a true otter, much larger than the closely kindred European species. Specimens measuring five feet from the end of the nose to the tip of the tail are not uncommon in remote places. This species ranges throughout North America, but is exceedingly rare in well-settled districts. Some have classed the *L.*

californica of the Pacific coast, and even one or more of the rather numerous but imperfectly known South American species of otter, as mere variants of the species. The common otter is chiefly hunted in winter, when its fur is at its best. It is fond of the amusement of sliding down-hill upon the belly, an amusement which it practices in winter upon the snow and ice and in summer upon some steep bank which slopes into a pool or deep stream. Unlike some of the other otters, it is a swift runner. It lives upon fish and is seldom seen far from the water. It is cunning in pursuit, and when brought to bay will fight with great courage, often proving itself a formidable antagonist to a dog or man. It is generally taken in steel traps. Besides the interesting and little-studied otters of South America allusion may here be made to the yapock (*Cheironectes yapock*) of South America, called the "little otter" in British Guiana. It is decidedly otter-like in its habits, but in reality it is only a semi-aquatic opossum, being one of the most strictly aquatic marsupials anywhere known. It may be added that a certain proportion of the otter skins of commerce are furnished by the strongly aberrant species which are found in Southern Asia, but their skins are usually small and the pelage is said to be poor.

(C. W. G.)

OTTERBEIN, PHILIP WILLIAM (1726–1813), the founder of the Church of the United Brethren in Christ, was born at Dillenburg, Germany, June 4, 1726. He was ordained as a minister of the Reformed Church at Herborn in 1749, but in 1752 followed the call of Rev. Michael Schlatter to become a missionary to the German settlers in America. He took charge of the church at Lancaster, Pa., but being disheartened by the prevailing indifference to religion he was led to join with Christians of other denominations in religious meetings held in the groves. In 1758 he removed to Tulpehocken, Pa., and afterwards to Frederick, Md., and to York, Pa. In 1774 he took charge of an independent congregation at Baltimore. He had sought fellowship in his spiritual views among the ministers of other denominations, and he fraternized especially with Asbury and with Martin Böhm. In 1784 he assisted Dr. Coke in ordaining Asbury as the first bishop of the Methodist Episcopal Church. In 1800 a conference called by him at Baltimore was attended by thirteen ministers, who formed the Society of the United Brethren in Christ. Although this eventually became a separate denomination, Otterbein is said never to have left the communion of the German Reformed Church. Meantime he and Böhm were recognized as its superintendents and have been called bishops, though that title seems not to have been used till after Otterbein's death. He died at Baltimore, Nov. 17, 1813. See *Life of P. W. Otterbein*, by Rev. A. W. Drury, D. D.

OTTUMWA, a city of Iowa, the county-seat of Wapello co., is on the Des Moines river, 76 miles W. of Burlington. The county was opened for settlement by the removal of the Sac and Fox Indians in 1843. Ottumwa was incorporated as a city in 1857 and then occupied a narrow strip of flat land between the river and the bluffs. This land is now covered by solid brick business blocks, while the residence portion of the town spreads out over the bluffs which attain an average elevation of about 150 feet. The town originally lay entirely east of the river, but in 1884 the city limits were extended and the west side has a population of about 1500. The length of the city along the river is about three miles. Its population in 1885 by the State census was 10,506. It is well supplied in the way of transportation facilities, being on the main line of the Chicago, Burlington, and Quincy Railroad, also on the Kansas City branch of the Chicago, Milwaukee, and St. Paul Railroad, and is the terminus of the Central Iowa and Wabash roads. Its other roads are the Keokuk and Des Moines branch of the Chicago, Rock Island, and Pacific and the Ottumwa and Kirk-

ville, a short coal-road. A Union passenger depot has been built at a cost of \$125,000. This point of the Des Moines River was known to the Indians as "Ottumwa-e-noch," signifying "swift water ford," the river at that time falling six feet over a rock bottom in the course of a half mile. In 1876 advantage was taken of this fall, and at an expense of about \$150,000 extensive dams were put in and abundant water-power obtained. The other advantages of the site, cheap coal (bituminous), excellent building stone, and the railroad facilities, have given an impetus to manufacturing. Among the industrial works are a starch-mill, linseed-oil-mill, 2 iron- and brass-foundries, a ruffler-factory, 2 machine-shops, plow-, cutlery-, and screen-factories, planing-mills, 2 furniture-factories, 2 boiler-works, 2 cooper-shops, 2 flour-mills, mining-drills, and bridge-works. There is also located here the second largest pork-packing-house in Iowa, killing 150,000 hogs a year. Ottumwa is also the centre of a large jobbing trade.

The public school system of the city comprises 4 buildings on the east side and one on the west side, erected at a cost of \$125,000. There is also a large Catholic academy, a normal school, and a business college. There are 15 churches, 2 opera-houses, 3 national banks, 6 hotels, and 2 daily and 6 weekly papers.

The city has excellent water-works, affording exceptional fire protection, gas, and arc and incandescent electric lights. There are six miles of street railway, operated by three companies. The system of sewerage is very complete.

The assessed valuation of city property is \$3,000,000, about one-third its actual value. The debt is \$54,000, and the expenses of the city in 1886 were \$40,378. Ottumwa is in the heart of the Iowa coal-fields and is built over a 4½-foot vein of coal. (A. H. H.)

OUSELEY, SIR FREDERICK ARTHUR GORE, an English musician, was born at London, Aug. 12, 1825, being the only son of Sir Gore Ouseley (1768–1844), ambassador to Persia and Oriental scholar. He graduated at Christ Church, Oxford, in 1846, took orders, and was curate of the Church of St. Barnabas, London, in 1849–50. He had also devoted himself to the study of music and received the degree of B. Mus. in 1850 and that of D. Mus. in 1854. For the latter he prepared an oratorio, *The Martyrdom of St. Polycarp*. He was made precentor of Hereford Cathedral in 1855, and also professor of music at Oxford, succeeding Sir Henry R. Bishop. From his means he built the Church of St. Michael, at Tenbury, of which he was first vicar. He is also warden of St. Michael's College, which had grown out of his labors as choir-master. He is noted for his attainments in music, and has published many anthems, the oratorio of *Hagar*, and standard treatises on *Harmony* (1869), on *Fugue and Counterpoint* (1869), and *Form in Music* (1875). He has also edited valuable collections of cathedral music.

OWEGO, a village of New York, county-seat of Tioga co., is on the Susquehanna River, at the mouth of Owego creek, 37 miles east of Elmira. The Erie Railroad is here crossed by the Southern Central and connects with the Delaware, Lackawanna, and Western. Owego has a fine court-house, 2 national banks, 8 churches, an academy, and graded schools, 3 weekly newspapers. The industrial works comprise a piano-factory, carriage-works, flour-mills, and manufactories of soap, leather, etc. Its population in 1880 was 5525.

OWEN, DAVID DALE (1807–1860), geologist, was born in Lanarkshire, Scotland, June 24, 1807. He was a son of the socialist, Robert Owen (1771–1858), for whom see *ENCYCLOPÆDIA BRITANNICA*. David was educated with his brother at Fellenberg's school at Hofwyl, Switzerland, and in 1825 settled with his father at New Harmony, Ind. He afterwards went to Germany to study natural science, and in 1833 returned to Indiana. In 1837 he was appointed by the Legislature

to make a geological survey of that State, and subsequently he was employed by the U. S. government in geological surveys in Iowa, Wisconsin, and Minnesota. The results were published in 1852. His surveys of Kentucky and Arkansas were conducted under the direction of those States, and he was also employed by individuals and companies in examination of special districts. He died at New Harmony, Ind., Nov. 13, 1860.

His brother, ROBERT DALE OWEN (1801-1877), became especially noted as an advocate of spiritualism. He was born at Glasgow, Nov. 7, 1801, but spent his early years at New Lanark, and three years in Switzerland. He went with his father to the United States in 1825, and took part in the social experiment at New Harmony, Ind. In 1828, for the promotion of infidelity, he established at New York a weekly paper called *The Free Inquirer*. While a member of the Indiana Legislature, 1835-38, he did much to promote common schools, and in Congress, 1842-47, he took part in organizing the Smithsonian Institution. In 1850 he served in the convention for the revision of the Constitution of Indiana, and secured for married women the control of their property. From 1853 to 1858 he was at Naples, at first as U. S. *chargé d'affaires*, afterwards as minister. During the civil war he supported the cause of the Union, and urged the emancipation of the slaves. He was employed by the government on important commissions relating to the freedmen and to ordnance stores. His later years were devoted to the propagation of spiritualism. He died at Lake George, N. Y., June 24, 1877. His principal works are *Footfalls on the Boundary of Another World* (1860); *The Debatable Land between this World and the Next* (1872), and *Threading my Way* (1874), the last being an autobiography of twenty-seven years.

OWEN, JOHN JASON (1803-1869), an American educator, was born at Colebrook, Conn., Aug. 13, 1803. He graduated at Middlebury College, Vt., in 1829, and studied theology at Andover. Although he entered the Presbyterian ministry, he was never pastor, his life being devoted to teaching and editing the classics. He was principal of the Cornelius Institute, New York, from 1836 to 1848, when he was made professor of Greek and Latin in the New York Free Academy. While he was vice-president of this institution its name was changed to the College of the City of New York. He died at New York, April 18, 1869. His publications were editions of Xenophon's *Anabasis* (1843), and *Cyropædia* (1846); Homer's *Odyssey* (1844) and *Iliad* (1851), a *Commentary on the Gospels and the Acts* (3 vols., 1857-69). He was an able scholar, faithful teacher, and learned commentator.

OWEN, SIR PHILIP CUNLIFFE, a British promoter of industrial art, was born June 8, 1828. His father being a captain in the British navy, he was engaged in that service from his 12th to his 17th year. Being then compelled to retire by ill-health he received an appointment in the science and art department at London. After faithful service for ten years he was appointed deputy-general superintendent of the South Kensington Museum. In 1860 he was made assistant director, and in 1873 succeeded Sir Henry Cole as director. He assisted at the Paris Expositions in 1855 and 1867, and was executive commissioner at the Centennial Exhibition at Philadelphia in 1876. He was secretary of the Royal commission for the Vienna Exposition in 1873, and for the Paris Exposition in 1878. He also took part in the International Fisheries Exhibition at London, 1883, the Health and Education Exhibitions, 1884, the Music Exhibition, 1885, and the Colonial and Indian Exhibition, 1887. In all of these cases he displayed great executive ability and essentially promoted the objects of the industrial exhibitions. Besides being knighted in 1873, he has received various marks of honor from his government.

OWEN, SIR RICHARD, English anatomist, was born at Lancaster, July 20, 1804. He studied medicine at Edinburgh and at St. Bartholomew's Hospital, London, becoming prosecutor to Abernethy. He became a member of the Royal College of Surgeons in 1826, and soon after assistant curator of the Hunterian Museum. Besides descriptive catalogues of the museum, he prepared the *Physiological Series of Comparative Anatomy* (1833-40). His valuable researches led to new classifications of animals and the addition of numerous genera and species. His ability was displayed in the reconstruction of extinct families. In 1836 he succeeded Sir Charles Bell as Hunterian professor in the Royal College of Surgeons, and in 1856 was made chief of the natural history department of the British Museum; he also held a professorship in the Royal Institution, London, and was connected with the prominent scientific societies. Among his works are: *Odontography* (2 vols., 1840-45); *British Fossil Mammals and Birds* (1846); *British Fossil Reptiles* (1848-55); *The Vertebrate Skeleton* (1848); *Parthenogenesis* (1849); *Lectures on Comparative Anatomy* (1843-46); *Anatomy of Vertebrates* (3 vols., 1866-68); *Fossil Reptilia of South Africa* (1875); *Fossil Mammals of Australia* (1877); *Wingless Birds of New Zealand* (1880).

OWENSBORO, a city of Kentucky, the seat of Daviess co., is on the Ohio River, 160 miles below Louisville, and on the Owensboro and Nashville, the Louisville, Evansville, and St. Louis, and the Louisville, St. Louis, and Texas Railroads. It is 10 feet above the highest water ever known in the Ohio River. A steam-ferry plies to Indiana and considerable trade is carried on by the river packet-lines. Owensboro has a U. S. government building, 4 hotels, 1 national bank, 4 State banks, 1 daily and 4 weekly newspapers, 16 churches, good public schools, and private academies. The manufacturing industries comprise 2 foundries, wagon-factory, wheel- and spoke-factory, planing-mills, flouring-mills, and tobacco- and cigar-factories. The chief staples of the vicinity are tobacco and whiskey, there being 23 tobacco-factories and 16 whiskey-distilleries. The city is lighted with gas and electric light, and is supplied with water by the Holly system. Its property is valued at \$3,000,000, its public debt is \$25,000, and the yearly expenses are \$47,000. It was settled in 1815, and incorporated as a city in 1850. Its population in 1880 was 6231.

OWL. To the remarks found in the *ENCYCLOPEDIA BRITANNICA* regarding the structural affinities of the owls, it may be added that the hawk-owl (*Surnia funerea*) of both continents is the most

acceptitine of known owls and furnishes the best argument that remains to those systematists who still cling to the grouping of the owls with the hawks and other diurnal birds of prey in the old and familiar order of *Raptora*. Some have found in the singular kakapo, or owl-parrot, a link between the owls and parrots, but though there seems to be a certain relationship between the parrots and the true birds of prey, it must be conceded that the kakapo is after all only an aberrant and strictly local form of the parrot tribe—an owl, it is true, in its physiognomy and in its nocturnal habits, but in no other respect. The relationship of owls through *Steatornis* to the goatsuckers is now generally given up as improbable, but the best recent opinion would seem to place the owls, the goatsuckers, and the guacharo in the position of parallel groups derived from some common parentage, probably belonging to that convenient yet confused and somewhat bewildering assemblage, the Picarian birds. (See ALUCONIDÆ.)

It is certainly remarkable that while the keen-eyed and strongly flying sub-family of Old World vultures have not a single representative in America, being replaced here by the totally distinct *Cathartides* (q. v.), several species of the owls, on the other hand, have

been able to spread over a large part of the world, six of our fourteen acknowledged species being European

Hawk-Owl.

as well as American. The burrowing owl (*Speotyto cunicularia*), which ranges from Canada southward to Patagonia, affords another example of the similar wide distribution of a remarkably interesting species.

OYSTER. The American oyster (*Ostrea Virginica*) has a wide range of distribution, being found at all suitable points along the Atlantic coast from Florida to the southern shores of the Gulf of St. Lawrence, and along the northern coast of the Gulf of Mexico. In some portions of this range it occurs in natural beds of enormous extent; that of Long Island Sound is said to be fully 115 miles in length, the oysters not being confined to the sound but extending around New York Bay and into the small bays along the Jersey shore. Oysters are often brought here from Chesapeake Bay and planted in the sound to supply the beds that have become exhausted by over-dredging.

In the waters of Virginia there is said to be 2,000,000 acres of oyster beds, while in Chesapeake Bay, with its many inlets and river mouths, the oyster finds its best adapted home, the bivalve here attaining its highest excellence and flourishing enormously. The bottom of the bay is almost covered with beds of the finest oysters in the world. Baltimore is the most important mart in the oyster trade and cans and pickles vast quantities of oysters for shipment to the West and to foreign countries. Farther down the coast oysters occur plentifully but are only gathered for local use. On the coast of Georgia they are said to exist in such multitudes as to form natural breakwaters sufficiently firm to resist the billows of the ocean. The coast region here is made up of salt marshes from twelve to eighteen miles wide, through which slow-flowing rivers make their way to the sea. These streams flow between banks of living oysters, so closely compacted that a vessel might, in some places, obtain a cargo in a space not more than three times its length.

Oysters abound in the inlets and small bays on the north shore of the Gulf of Mexico. In the Bay of Mobile they are plentiful and of excellent quality, and are cultivated on a large scale. In Louisiana are beds

of oysters said to be unsurpassed in size and flavor. On the Pacific coast oysters occur abundantly in the Strait of Fuca and in Puget Sound; these are quite small, but of fine flavor. The Eastern oyster has been introduced and seems to be susceptible of easy cultivation.

The American oyster is exceedingly prolific, far more so than its European counterpart, which produces about 2,000,000 young, while the American bears from 10,000,000 to more than 60,000,000 in some instances. The European oyster takes some degree of care of its young, keeping them within the folds of the mantle until they are several days old, while in the American oyster fertilization takes place in the water and the young are exposed from birth to the perils of the waves, so that they are destroyed in far greater numbers than in the case of the European. The minute embryo bivalves swim about by the aid of cilia for several days, feeding on the minutest life-forms of the ocean, after which they fix themselves to some substance to which one of the shell valves becomes cemented. There, if not artificially removed, the remainder of their life will be spent. The American oyster grows much faster than the European and attains a considerably greater size. At the end of a fortnight's growth it is of the size of a pin's head; in three months it attains the size of a pea; then it grows more rapidly, becoming an inch long in six months. It is ready for market in about three years, and its average life is about ten years, though thirty-year-old oysters have been known. These old oysters, at times, attain great size; one found in Mobile Bay is said to have been more than 3 ft. long and nearly 2 ft. broad, but they rarely exceed 3 in. in width, though often found over a foot long. When grown under favorable circumstances the shells, at first round, become oval in shape with undulated and scalloped edges, but after the first winter become elongated and irregular, the shape being greatly governed by that of the object to which the oyster is attached. In the natural banks the oysters become so crowded that they are apt to stand in a vertical position, the hinge downward and the mouth of the shells upward. Being contracted laterally they often become very long and narrow, forming what are known as "raccoon oysters," or "cat's tongues." The lower layers of these beds are smothered and die through the annual additions above.

The mortality of the young oysters is enormous, very few individuals of each batch of millions surviving. They have many enemies, while great numbers perish from lack of a clean surface to which to attach themselves, being smothered in their embryo state by a very thin layer of mud or slime. The mature oysters, also, have many enemies, chief among them the star-fish and the "drill," or boring whelk, yet in spite of these and their human foes, it is only the lack of proper conditions of sea bottom that limits the indefinite increase of the oyster beds. The oyster, in fact, cannot live except under certain conditions of depth and salinity of water, and of firmness of bottom, a mixture of clay and mud forming favorable ground. Soft mud is fatal, and deposits of mud through storms may cause great injury. The young oysters attach themselves to the shells of older ones and beds of great thickness are thus gradually formed. On the western coast of Florida, and in other tropical regions, they attach themselves to the roots and limbs of the mangrove trees. Natural beds can be enlarged and artificial beds made by the deposition of shells, gravel, or tiles over muddy bottoms. Oyster-shells are much used as "cultch," to which the young fry attach themselves and from which they may be transplanted. Seed-oysters are thus carried from Virginia and Maryland to the beds of the North, where they are planted in shoal waters to be fattened for market.

Prof. Ryder speaks of having examined oyster beds in water so shallow that the animals are almost entirely exposed to the air during low tide. In severe

winters a considerable proportion of the oysters in these beds are destroyed by freezing; yet the animals are so prolific that the beds are said to be fully restored in a year or two. The movement of the tides is an advantage to these beds, in keeping them clean, and in bringing a full supply of the minute animals and plants which form the food of the oyster.

Of late years the study of the embryology of the oyster has been diligently prosecuted under the auspices of the United States Fish Commission, with the ulterior purpose of successful artificial propagation. The experiments have been attended with promising indications, though no practical application of the results has been made. It is found that artificial fertilization of the eggs can be easily performed, and that the young can be kept alive until ready to attach themselves. This, however, is of minor importance, as natural fertilization can be easily employed under favorable conditions. The important purpose to be attained is that of the protection of the fry until ready to attach itself, the preparation of abundant and properly distributed cultch for attachment, and arrangements for readily transplanting the young without injury.

Several scientists of the Commission have given attention to this subject, among them Prof. A. Brooks and Winslow, and more recently Prof. John A. Ryder, who has devoted several years to the study. He advises the use of spawning ponds with systems of canals, into which the tides can ebb and flow daily, while by the aid of a filtering apparatus the enemies of the oyster can be in great measure excluded. The canals are to be so arranged as to contain within a limited space a very considerable number of movable collectors, consisting of frame-work filled with tiles, slates, shells, etc. The water is made to flow through the full length of these collectors, and as the fry is swept by the tide backward and forward it attaches itself to the cultch in the frames. The collectors being movable can be rocked on their supports, and the sediment which is so fatal to the young oyster washed out. When the seed-oysters are sufficiently grown they can be easily removed by lifting out the framework, and conveying the cultch in boats to the beds in which it is desired to plant the young oyster as seed.

Prof. W. K. Brooks proposes the use of floating collectors, saying that the embryo has a tendency to swim to the surface, and that cultch in floating cages would be free from danger of sediment, that fatal

enemy of the larval oyster. In an experiment which he tried he obtained a good "set," and the young oyster grew with remarkable rapidity, signifying an abundant supply of food and other favorable conditions.

It is obvious that in the modes here indicated it is possible to obtain an abundant supply of healthy seed-oysters, particularly in that proposed by Prof. Ryder, which is the outcome of long study and experiment, and in which the unfavorable conditions are in great measure eliminated. Similar care of the subsequent growth of the oyster is necessary. As planted in open beds it has two destructive enemies, the star-fish and the inconsiderate dredger, who often destroys more oysters than he collects. At the Island of Ré, on the coast of France, vast numbers of oysters are raised in small "parks," separated by walls, and planted with seed-oysters. As a consequence this small island, of about twelve miles circumference, now yields annually 400,000,000 oysters on what were originally its shores of deep and useless mud. Prof. Ryder believes that the salt marshes of many localities on our Atlantic coast could be similarly utilized, oyster ponds of three or four feet in depth being dug and connected with tide water by canals, while the inflowing water could be filtered of its dangerous ingredients. Abundant oyster-food would grow in such ponds. In this way, he thinks, the harvest of the American oyster could be enormously increased. As yet, however, the natural and planted beds yield a good supply, and the extension of the area of cultivation will probably be left for the future.

The fattening of the oyster is a subject of some interest. What we call fat in the oyster is really not fat at all, but a deposit of the purest and most nutritious protoplasm, which forms a highly digestible food. It is laid down in the mantle of the animal during the winter season, and exhausted during the reproductive period, when the oyster becomes very poor and non-nutritious. The so-called fattening by removing the oysters for a few days to water fresher than that in which they grew is a dealer's fraud. The oyster is plumped out by absorbing the fresh water, and the only real effect is that it loses part of its saltiness. Some dealers even use steam to warm the water, so as to induce the oysters to take in more.

We give, from the 1880 Census Report, the most recent general statement of the American oyster industry.

Oyster Industry of the United States, according to Census Report of 1880.

States.	Persons Employed.	Capital Invested.	Bushels Produced.	Value to Producer.	Value of Sales.
New Hampshire.....	9	\$ 2,400	1,000	\$ 800	\$ 6,050
Massachusetts.....	896	303,175	36,000	41,800	405,550
Rhode Island.....	650	110,000	163,200	225,600	356,925
Connecticut.....	1,006	361,200	336,450	386,625	672,875
New York.....	2,724	1,013,000	1,043,300	1,043,300	1,577,050
New Jersey.....	2,917	1,057,000	1,975,000	1,970,000	2,080,625
Delaware.....	1,065	145,000	500,000	325,000	687,725
Maryland.....	23,402	6,034,350	10,600,000	2,650,000	4,730,476
Virginia.....	16,315	1,351,100	6,837,320	1,948,636	2,218,376
North Carolina.....	1,020	68,500	170,000	60,000	60,000
South Carolina.....	185	12,250	50,000	20,000	20,000
Georgia.....	350	18,500	70,000	35,000	35,000
Florida.....	166	22,000	78,600	15,950	15,950
Alabama.....	300	16,000	104,500	44,950	44,950
Mississippi.....	60	3,000	25,000	10,000	10,000
Louisiana.....	1,400	36,750	295,000	200,000	200,000
Texas.....	240	17,750	95,000	47,300	47,300
Washington Territory.....	85	6,550	15,000	10,000	45,000
Total.....	52,805	\$10,583,295	\$22,195,370	\$9,034,861	\$13,438,852

The total value of sales includes for Maine \$37,500, and for Pennsylvania \$187,500, Philadelphia being an important seat of the oyster trade.

P.

PACA, WILLIAM (1740–1799), a signer of the Declaration of Independence, was born at Wye Hall, Harford co., Md., Oct. 31, 1740. He graduated at the College of Philadelphia in 1759, and studied law at Annapolis. He became a leading lawyer in Maryland, and his opinion on the poll-tax for the support of the clergy was republished in England. In 1771 he was elected to the Legislature, in which he advocated the rights of the colonists against the proprietor. His activity as a patriot caused him to be sent as delegate to the Continental Congress in 1774. Though employed in important business, he and his colleagues were long restrained by the Convention of Maryland from advocating separation from the mother country. But at the end of June, 1776, permission was obtained and Paca signed the Declaration. While still a member of Congress he served in the State Senate for two years. In 1778 he was made chief-judge of the Superior Court of Maryland, and in 1780 chief-judge of the Court of Appeals. In 1782 he was elected governor of Maryland and again in 1786, each term being a single year. He was a member of the State Convention which ratified the Federal Constitution. When the U. S. Judiciary was organized in 1789, he was made district judge of Maryland, and held this office till his death in 1799.

PACKARD, ALPHEUS SPRING (1799–1884), an American educator, was born at Chelmsford, Mass., Dec. 20, 1799. He graduated at Bowdoin College in 1816, and after studying theology returned to it as tutor in 1819. After being professor of Latin and Greek for forty years he was in 1864 transferred to the Collins professorship of natural and revealed religion. On the retirement of Pres. J. L. Chamberlain in 1883 he became acting president. He died July 13, 1884. He had been librarian of the Maine Historical Society 48 years. Besides contributing to various periodicals he published an edition of Xenophon's *Memorabilia* (1839), a *History of the Bunker Hill Monument Association*, and with Prof. N. Cleveland a *History of Bowdoin College* (1882).

His son, **ALPHEUS SPRING PACKARD, Jr.**, noted as a naturalist, was born at Brunswick, Maine, Feb. 19, 1839. He graduated at Bowdoin College in 1861, studied natural history under Prof. L. Agassiz and the Museum of Comparative Zoölogy. He also studied medicine, graduating at the Maine Medical College in 1864. He devoted himself chiefly to entomology, on which he lectured at Bowdoin College for many years. He has been curator of the Peabody Academy of Natural Sciences at Salem, Mass., and one of the editors of the *American Naturalist*, and has taken part in several scientific expeditions. He has published *Glacial Phenomena of Labrador and Maine* (1867); *Guide to the Study of Insects* (1869); *Our Common Insects* (1873); *Half-Hours with Insects* (1875); *Zoölogy for Students* (1879); *A Naturalist on the Labrador Coast* (1888); *Forest and Shade-Tree Insects* (1888). He has also published numerous monographs and some school-books. See Henshaw's *Entomological Writings of A. S. Packard* (1887).

PACKER, ASA (1806–1879), railroad constructor, was born at Groton, Conn., Dec. 20, 1806. In his boyhood he removed to Pennsylvania, and was engaged in canal-boating. As store-keeper, boat-builder, contractor, and coal-miner he steadily acquired wealth. In 1844 he was elected to the State Legislature, and was afterwards county judge for five years. About 1850 he projected the Lehigh Valley Railroad as an outlet for the anthracite coal region, and secured its construction and its subsequent extension to connect with the Erie Railroad and with New York city. In

1853 he was elected to Congress as a Democrat, and served two terms. In 1865 he announced his purpose to give \$500,000 and 115 acres of land for the erection of Lehigh University (*q. v.*), which was commenced immediately and attained a fair degree of prosperity in his lifetime. He died at Philadelphia, May 17, 1879. His will increased the endowment of Lehigh University to \$1,500,000, and his family have since made further gifts to the institution.

PADUCAH, a city of Kentucky, county-seat of McCracken co., is on the Ohio River, 48 miles above its mouth and at the mouth of the Tennessee. It is 225 miles by railroad W. S. W. from Louisville, next to which it ranks among the cities of the State. It carries on a large river-trade, and from it several lines of steamboats start. The Newport News and Mississippi Valley Railroad also gives facilities for trade, and has established here car-repair shops. The wholesale trade for 1886 was estimated at \$9,000,000 and the retail was still larger. Paducah contains a U. S. government building, a court-house, 3 national banks, 2 hospitals, 17 churches, 7 graded schools and a high-school, 2 daily and 2 weekly newspapers. The industrial works comprise 2 foundries, 4 saw-mills, 2 planing-mills, marine ways for building and repairing steamboats, and manufactories of soap, vinegar, ice, wagons, carriages, harness, brooms, flour, meal, and tobacco. The city is lighted with gas and has an efficient fire department and is supplied with water from the Tennessee River. The first settlement on the site was in 1821, the town was laid out in 1827, and received a city charter in 1856. In September, 1861, it was occupied by Gen. U. S. Grant, then commanding at Cairo, and throughout the war it was held by Union troops, although Gen. N. B. Forrest made a raid upon it in March, 1864. Its population in 1870 was 6866, and in 1880 was 8036.

PAGE, THOMAS JEFFERSON, commodore, was born at Shelly, Va., Jan. 4, 1808. His grandfather, John Page (1744–1808), was governor of Virginia, 1802–5. Thomas entered the U. S. navy in 1827 as midshipman, and was afterwards engaged in the Coast Survey. After a voyage around the world while lieutenant he planned a survey of the China seas, which was eventually changed to the expedition to Japan, commanded by Com. M. C. Perry. Page declined the second place in the expedition, but in 1853 commanded the expedition to explore the Rio de la Plata. While thus engaged his steamer was fired upon from a Paraguayan fort in February, 1855. He returned to the United States in May, 1856, having been promoted commander. In 1859 a fleet sent out by his government obtained from Paraguay reparation for the attack upon him. He completed his surveys in 1860, and in the next year resigned his commission and entered the Confederate service. He was engaged in resisting Gen. McClellan's advance on Richmond, but afterwards went to England to take command of an iron-clad. When prevented by the vigilance of the U. S. Minister he obtained a vessel at Copenhagen, which, however, was soon seized in Spain. He then removed to the Argentine Republic and engaged in cattle-farming. That government also employed him to superintend the construction of iron-clads in England. He resides at Florence, Italy. He published the narrative of his South American explorations in *La Plata* (1859).

His nephew, **THOMAS NELSON PAGE**, born in Hanover co., Va., April 23, 1853, has become noted as a writer of stories and poems in the negro dialect. He was educated at Washington and Lee University and is a lawyer at Richmond. His first story was *Marse Chan* (1884), and a collection of

them was published under the title *In Ole Virginny* (1887).

PAGE, WILLIAM (1811–1885), painter, was born at Albany, N. Y., Jan. 23, 1811. During his boyhood his parents removed to New York city, where he studied painting under S. F. B. Morse and at the National Academy. For a while he intended to enter the Presbyterian ministry, but his faith was shaken and he resumed his artistic pursuits at Albany. Then suddenly abandoning a projected visit to Europe, he married and settled in New York, where he became a member of the Academy in 1836. He achieved distinction in portrait-painting, but produced also historical pictures, a Holy Family, and the Infancy of Henri IV. For a while he resided in Boston, and in 1849 he went to Europe, where he found such attractions that he remained eleven years. He became intimate with the Brownings at Florence, and painted excellent portraits of Robert Browning and Miss Cushman. Other works of this period are Moses and Aaron on Mount Hor, The Flight into Egypt, and his famous Venus, representing the goddess guiding Æneas's fleet to Italy. In his brilliancy of coloring Page had become a rival of Titian; though he was still as from the first a disciple of Allston in spirituality. His natural gifts, careful study, and keen insight gave his works the highest value. After his return to New York in 1860 Page's fame as a portrait-painter became equal to that of Gilbert Stuart. He painted Lowell, President Eliot of Harvard, Henry Ward Beecher, Admiral Farragut, General Grant, and many more. From 1871 to 1875 he was president of the Academy of Design, and his lectures in art attracted much attention from his remarkable theories. While in Europe he found in the writings of Swedenborg a solution of the doubts which had harassed his mind since his early theological studies. These mystical views were blended with his theory of art. In his old age his intellect was clouded, and for ten years he did little work. While his studio was in New York his home was on Staten Island, and there he died Sept. 30, 1885. He had been thrice married and twice divorced.

PAINE, ROBERT TREAT (1731–1814), signer of the Declaration of Independence, was born at Boston, March 11, 1731. His father, Thomas Paine, had been pastor of a church at Weymouth, Mass., but afterwards became a merchant at Boston. Robert graduated at Harvard College in 1749, taught school, studied theology, and in 1755 became chaplain to the Northern provincial troops. He was admitted to the bar in 1759, and settled at Taunton, Mass. In 1770 he was counsel for the prosecution of Capt. Preston and others for the Boston Massacre. In 1773 he was chosen to the legislature, in 1774 to the Provincial Congress and also to the Continental Congress, where he was a member of important committees. In 1777 he was attorney-general of Massachusetts, and also a member of the executive council. In 1779 he took part in preparing the State Constitution, and soon after removed to Boston, where he held high position at the bar. He was a judge of the Supreme Court of Massachusetts from 1790 to 1804. He died at Boston, May 11, 1814.

His son, ROBERT TREAT PAINE, JR. (1773–1811), was born at Taunton, Mass., Dec. 9, 1773. While a student at Harvard College he became noted for his knack of versifying. When he graduated in 1792 he entered a counting-house but still spent his time chiefly in rhyming. He assisted in introducing "stage-plays" into Boston, and married Miss Baker, an actress. In 1794 he started *The Federal Orrery*, a paper whose personalities made him many enemies. The poem, *The Invention of Letters*, delivered on his taking his degree of A. M., in 1795, gave him wide celebrity which was enhanced by another in 1797 on *The Ruling Passion*, and still more in 1798 by his famous song, *Adams and Liberty*. Having removed

to Newburyport, he took up the study of law, and after his return to Boston was admitted to the bar in 1802. He had many literary projects which were cut short by his death at Boston, Nov. 13, 1811. His name was originally Thomas Paine, but on his petition to the Massachusetts legislature in 1801, pleading that this was no Christian name, he was permitted to assume that of his father. His writings were collected and published by Charles Prentiss in 1812.

PAINTING IN AMERICA. The branch of painting earliest practised in this country was naturally portraiture. Many of the paintings that have come down to us from the colonial period were, of course, brought over from Europe. But that painters, such as they were, were practising their art in the colonies as early as 1667, is shown by a passage in Cotton Mather's *Magnalia*. The earlier artists here were naturally foreigners, and were usually painters of no high order. But not a few who in their native land would have been barely accounted respectable artists, earned fame and money in the new land by transferring to canvas the faces of the colonial dignitaries.

The first artist of whom we have any record is John WATSON (1685–1768), a Scotchman, who came to America in 1715, settling at Perth Amboy, N. J. He painted several of the colonial governors, but none of his works are known at present. John SMYBERT (1684–1751), another Scotchman, is better known to us, as a number of his portraits are still extant. Bishop Berkeley engaged him as professor of the fine arts in his projected college in Bermuda. Smybert came to this country in 1829, and the Bermuda project proving a failure, he settled in Boston. Gulian C. Verplanck said of him: "Smybert was not an artist of the first rank, for the arts were then at a very low ebb in England, but the best portraits which we have of the eminent magistrates and divines of New England and New York who lived between 1725 and 1751 are from his pencil." His most important work is the group of Bishop Berkeley and his family, painted in 1731, which was given to Yale College in 1808. A copy of Vandyke, which he made in Italy, is said to have inspired several of our native American painters, notably Trumbull and Allston, with a love of art, and to have given them their first ideas of color. Smybert was followed by a swarm of foreign artists. BLACKBURN made a brief visit, Cosmo ALEXANDER, a Scotchman, came over in 1770, William WILLIAMS painted for a time in Philadelphia, John RAMAGE was painting miniatures in Boston in 1771, and so the list might be extended. The earliest native painter of merit of whom we have record is Robert FEEKE. He was painting portraits in Philadelphia about the middle of last century, and specimens of his work are in possession of Bowdoin College, the Redwood Athenæum, Newport, R. I., and the Rhode Island Historical Society. Next in date is Matthew PRATT (1734–1805), although his contemporaries, West and Copley, were earlier known as artists. Portraits like that of Cadwalader Colden, painted for the N. Y. Chamber of Commerce in 1772, attest his undoubted talent. He was remembered by many as an excellent painter of sign-boards, an occupation which he followed for some time. But the most noted painters of this period were John Singleton Copley and Benjamin West. COPLEY (1737–1815) had already established a reputation as a painter when he went to Europe in 1774. He went first to Italy, and thence to London, where he settled and became a member of the Royal Academy. In his portraits the dryness of tone and stiffness and formality of the figures have been objected to. He was a master in the rendering of stuffs, as is attested by the numerous specimens of his skill in portraiture in the Museum of Fine Arts, Boston, and at Harvard University. Many of his portraits are also in private collections in the United States. Of his numerous historical pictures, executed in England, the Death of the Earl of Chatham is the best known.

Benjamin WEST (1738-1820) was a successful portrait-painter in Philadelphia, at the age of 18. He went to Italy in 1760, and three years later to London, where he became the leading historical painter, was elected president of the Royal Academy, and enjoyed the king's patronage and protection for many years. He produced a very large number of historic and scriptural compositions, notably, *The Departure of Regulus*; *Death on the Pale Horse*; *The Death of Wolfe*; and *Christ Rejected*. There is in his works much that is conventional, and a certain brick-red coloring in them has been objected to. Yet West certainly possessed talent of a high order, and a thorough knowledge of the principles of his art. He showed moral courage, too, when, in painting the *Death of Wolfe*, he insisted, contrary to the advice of Reynolds, in clothing his characters in the dress of their time, repudiating the traditional custom of employing classical costume in all historic painting. He was withal a kind-hearted and benevolent gentleman, and had always a hearty welcome and good advice for the struggling young artists who came to him from his native land for instruction and assistance.

The next period, that of the Revolution, produced two painters whose names stand high in the list of American artists, Gilbert Stuart and John Trumbull. STUART (1755-1828) had his first art-instruction from the before-mentioned Cosmo Alexander, with whom he went to Scotland in 1772. He made several visits to Europe, and studied under West, in London, for several years. He returned finally to America, in 1793, and found ample employment for his brush. Of his large number of national portraits, the one of Washington, known as the "Athenæum head," is best known to the American public, although most critics consider it inferior to his first picture of Washington. His portraits are remarkable for color—to quote his daughter: "Color was one of Stuart's strong points." He was a master in the rendering of flesh tints, and gave his attention principally to the heads, in which he was most successful, alighting the figures and drapery, which, in some of his portraits, at least, are quite careless in execution. Excellent specimens of his works are owned by the Museum of Fine Arts, Boston, the New York Historical Society, and other institutions.

TRUMBULL (1756-1843), the son of Governor Jonathan Trumbull, of Connecticut (1710-1785), was educated at Harvard, and served with distinction in the war of the Revolution. He studied under West, in London, and later made several visits to Europe. He produced a number of portraits, including several of Washington, which, though perhaps unlike in details of feature, are usually spirited and lifelike in their general resemblance. It was in historical composition that his talents were conspicuous, and he yet stands alone in American historical painting. His most notable works are: *The Siege of Gibraltar*; *Declaration of Independence*; *Death of Montgomery*; and *Battle of Bunker Hill*. He was peculiarly fitted to depict the scenes in the history of the American struggle for independence. Himself prominent in public affairs, intimately acquainted with many of the prominent actors in his pictures, and thoroughly in sympathy with his subject, he produced a series of paintings which, in their line, are as yet unsurpassed in American art. In 1817 he received a commission from Congress for four historical subjects: *Declaration of Independence*; *Surrender of Burgoyne*; *Surrender of Cornwallis*; and *Resignation of Washington*. His later works are quite inferior to his earlier ones. His pictures were bequeathed to Yale College, where some of the best specimens of his skill may be seen.

Another well-known artist of this period was Charles Wilson PEALE (1741-1827). He was notable rather for his versatility than for extraordinary talents in any direction. Besides turning his mechanical talent to account in various ways, he acted as soldier, legislator, naturalist, and what not. His fame rests mainly on

his portraits, among which are several of Washington, who gave him, it is said, no less than fourteen sittings. Many of his pictures are in the Pennsylvania Academy and in Independence Hall, Philadelphia. Of the numerous members of his family who also chose art as a profession, his son Rembrandt (1778-1860) was the only one who achieved any works of real note. Among these is a good portrait of Washington.

Joseph WRIGHT (1756-93) and Edward SAVAGE (1761-1817) were also known as portrait-painters. William DUNLAP (1766-1839), like most artists of his time, tried his hand at a portrait of Washington. He is, however, better known as an author, and published in 1834 a *History of the Arts of Design in the United States*, now quite scarce. Col. Henry SARGENT (1770-1845) was an artist of repute in his time; and John Wesley JARVIS (1780-1840), an English portrait-painter, also enjoyed considerable popularity, as did later also Chester HARDING (1792-1866) and Edward G. MALBONE (1777-1807), whose miniatures are unsurpassed. Thomas SULLY (1783-1872) painted many prominent Americans, but was most successful in his female heads. His contemporary, John NEAGLE (1796-1865), is best remembered by his excellent full-length of Patrick Lyon, the blacksmith, painted in 1825. John VANDERLYN (1775-1852) also painted a number of portraits, but is best known by his *Marius Among the Ruins of Carthage*, and *Ariadne*, which latter, classic in style, is a very creditable work.

During all this initiatory period art in this country achieved its greatest successes in the department of portraiture and figure-painting. It was, furthermore, greatly under the influence of England. Now there gradually came a change, and the eyes of our art-students going abroad were turned towards Italy. Imitation of foreign art-methods was natural and, indeed, unavoidable. On the other hand there were various attempts made to found art-academies in New York and Philadelphia, culminating in the establishment of the Pennsylvania Academy and the New York Academy of Design. One of the leading representatives of the tendencies towards idealism, often false, that dominated much of our art, was Washington ALLSTON (1779-1843), a native of South Carolina. He studied under West, and lived for a number of years in Italy. His works aroused much enthusiasm, and his coloring won for him the name of "the American Titian." But, as is always the case with those overestimated in their time, there is now a tendency to underrate the work of Allston. Though not possessing genius of a high order, he was an artist of undoubtedly great talent, hampered, perhaps, by the want of encouraging influences in his native land. *The Dead Man Revived by Touching Elisha's Bones*; *Saul and the Witch of Endor*; *Spalatro's Vision of the Bloody Hand*; and *Jeremiah and the Scribe*, are among his works, in some of which he shows an unhealthy love for the terrible and supernatural. He also left an unfinished work, *Belshazzar's Feast*, now in the Museum of Fine Arts, Boston. John VANDERLYN, already mentioned, was a good classic painter, who won success while abroad, and gained a medal in Paris at the Salon of 1808. Samuel F. B. MORSE (1791-1872), better known in a totally different walk of life, was in the early part of his career an artist, practising both sculpture and painting. He composed a painting of the *Dying Hercules* from his statue of the same name. This work shows considerable anatomical knowledge. Morse was the first president (1826-42) of the National Academy of Design.

Among the portrait-painters of this period were: Samuel L. Waldo (1783-1861) and William Jewett (b. 1795), who painted in partnership; William E. West (1788-1857); Charles C. Ingham (1797-1863); Henry Inman (1801-46); Charles Loring Elliott (1812-68); George P. A. Healy (b. 1813); William Page (1811-85); W. H. Furness (1828-67); Thomas Le Clear (1818-82); George A. Baker (1821-80);

Thomas P. Rossiter (1817-71); Joseph Ames (1816-72), and Richard M. Staigg (1817-81), noted for his miniatures, in which department Thos. S. Cummings also worked. One of the strongest of the lot was Elliott, who was especially successful in the rendition of character. Page experimented much in color, striving especially to discover Titian's method of painting. Daniel Huntington, Thomas Hicks, and Geo. H. Yewell have also produced notable works in portraiture.

Another change becomes noticeable towards the middle of this century, for Düsseldorf and Munich began to claim a share in shaping our national art. Emanuel LEUTZE (1816-68) is one of the most prominent artists of this period. A German by birth, he was brought to America as an infant. Although his art-education was received in Düsseldorf, he showed an extraordinary love for American subjects. Among his more important paintings are, Washington Crossing the Delaware; Washington at the Battle of Monmouth; Washington at Valley Forge; and Westward the Star of Empire Takes its Way, the last in the Capitol at Washington. A number of other painters during this period gave more or less attention to historic subjects, but little worthy of note was accomplished in this direction. Edwin WHITE (1817-77), who studied at Paris and Düsseldorf, painted some American historic pieces, notably Washington Resigning his Commission. He was exceedingly prolific, most of his works dealing with European subjects. Peter F. ROTHERMEL has produced some works illustrative of American history, among which is the Battle of Gettysburg. John G. Chapman, well known as an illustrator and *genre* artist, also aspired to this difficult field of painting, as did also John Blake WHITE (1781-1859). William H. POWELL (1823-79) is known best by his De Soto discovering the Mississippi, in the Capitol at Washington. Christian SCHUSSELE (1824-79), an Alsatian, was for some years director of the schools of the Pennsylvania Academy, in which capacity he exercised a certain influence on our art. His *Clear the Track*, *Men of Progress*, *The Iron Worker* and *King Solomon*, and other works, became widely known through the prints by John Sartain and other engravers. Thomas P. ROSSITER (1817-71) painted many historical and scriptural subjects, and Robert W. WEIR is known as the painter of the *Sailing of the Pilgrims*, and similar works, pleasing in style, although not strikingly original.

In the department of *genre* our artists had, until now, made but few attempts. Charles Robert Leslie and Gilbert Stuart Newton can hardly claim a place here, as they are so closely identified with the art of England. Henry INMAN (1801-46), known best by his excellent and characteristic portraits, executed some *genre* pictures, but the most important *genre* painter of the period was William Sidney MOUNT (1807-68). His works were thoroughly national in spirit; no one has so well delineated the humorous side of the life of the American farmer; and the negro, too, figured frequently in his compositions. As a colorist he was not remarkable, but his pictures show a shrewd observation of human nature. F. W. EDMONDS (1806-63) produced some clever pictures of American subjects, and Richard Caton WOODVILLE (c. 1825-1855), who studied at Düsseldorf, became well known through his *Mexican News*, *Sailor's Wedding*, etc., but was unfortunately cut short in his career when but 30 years of age. Our Indians and trappers found delineators in George CATLIN (1796-1872), Charles Deas, and William RANNEY (1813-57).

To come down to the *genre* art of a later date, John B. IRVING (1825-77) was noted for his spirited execution and elaborate finish, and Frank B. MAYER (b. 1827) also won distinction in this line. John F. WEIR has executed some vigorous paintings, like *Forging the Shaft*, and Seymour J. Guy has given us some charming pictures of child-life. Two of our best-known *genre* artists are Thomas W. WOOD and John G.

BROWN. The former frequently chooses scenes in rural life, and has also produced numerous characteristic pictures of negro subjects. Mr. Brown has come to be considered mainly as the painter *par excellence* of our news-boys and boot-blacks, whom he often brings before us in characteristic positions. Others more or less known in the department of figure-painting are Benjamin F. Reinhart (1829-85); John W. Ehninger; Constant Mayer; Edward H. May (1824-87); Alfred C. Howland; E. Wood Perry; Lemuel E. Wilmarth; Geo. W. Flagg; Cephas G. Thompson; Jerome Thompson; E. L. Henry; W. J. Hennessy; P. P. Ryder; Robert Wylie (d. 1877); Thomas Hovenden; Walter Satterlee; E. M. Ward; Julian Scott; Henry Mosler; J. W. Champney, and William Magrath. Daniel Huntington, better known as a portrait-painter, has executed graceful and pleasing figure-pieces. George Fuller, Henry A. Loop, and F. S. Church represent the ideal element among our figure-painters. Geo. H. Boughton excels in Puritan subjects, Eastman Johnson has produced effective work in the delineation of negro life and domestic scenes, and A. Wordsworth Thompson has given us some good historical compositions.

In our landscape art we for the first time find decided originality, and a national feeling which foreign influences did not suppress. Our landscape artists, although occupied at times also with European subjects, show in their works a notable preference for the scenery of their own country. The Catskills, the White Mountains, Hudson River, Lake George, and later the Rocky Mountains and the Yosemite Valley, have furnished subjects for innumerable paintings.

Joshua SHAW (1776-1860), an English artist who came over about 1817, was apparently the first in this country to make a specialty of landscape. But Doughty, Cole, and Durand are generally regarded as the pioneers in this branch of art. Thomas DOUGHTY (1793-1856) left the leather business at the age of twenty-eight to take up landscape-painting, and he followed with much success the art which he had adopted with so little preparation. Thomas COLE (1801-48), born in England, came to this country at the age of eighteen, and received his first training here. He later studied for some time in Italy, and his work shows distinct traces of the influence of Salvator Rosa and Claude. The works by which he is best remembered are his allegoric landscapes, especially his *Course of Empire*. Regarded simply from an art point of view, his paintings show faults, yet there is in them a moral intent and purpose and a dignity and grandeur which have secured for him a high place among his contemporaries. He undoubtedly, too, had a lasting effect on our landscape art. Asher B. DURAND (1796-1886) had gained an enviable reputation in other branches of art before he took up landscape-painting. As a steel-engraver, he employed his burin in producing such admirable plates as Vanderlyn's *Ariadne* and Trumbull's *Declaration of Independence*. Next he practised portrait-painting with success, and finally, at the age of thirty-eight, he directed his efforts to landscape art. The care he had found it necessary to exercise as an engraver was carried into his new vocation, and his landscapes, though faithful in detail, are yet broad and effective. He excelled especially in rendering the individuality and characteristics of trees, and produced occasionally successful atmospheric effects.

One of the most prominent of the landscape-painters who followed was John F. KENSETT (1818-73), who, like Durand, began his career as an engraver. He passed a number of years abroad in study, and after his return produced many faithful delineations of the scenery of his native land. His paintings are good in technique, broad in treatment, excellent in color, and show much poetic feeling. George L. BROWN (b. 1814) was somewhat under the influence of Italy, and much of his work deals with the scenery of that country. His paintings are effective and brilliant in light and color, but he belonged to a school which at times, perhaps,

somewhat slighted nature. Worthington WHITTREDGE was among those who studied at Düsseldorf, when that school was first introduced as an influence into our art. He is a close student of nature, and although for technique he doubtless owes much to foreign training, yet his work is thoroughly individual, and shows but few traces of foreign influence. John W. CASILEAR, like Durand and Kensett, was at first an engraver, and later abandoned the burin for the brush. His elaborate landscapes, though not distinguished for originality, are refined and delicate. James A. SUYDAM's tender landscapes were characterized by somewhat similar qualities. Jasper F. CROSEY, though somewhat crude at times, has had more or less success in reproducing the vivid coloring of our autumnal scenery, and R. W. Hubbard's simple, harmonious compositions have been praised by more than one critic as veritable poems. T. Addison Richards, C. P. Cranch, A. H. Wenzler, Martin J. Heade, David Johnson, J. R. Meeker, John B. Bristol, Wm. Russell Smith, Charles H. Miller, Aaron D. Shattuck, Wm. L. Sonntag, H. W. Robbins, John R. Tilton, A. H. Wyant, James B. Sword, Kruseman Van Elten (a Dutchman by birth), J. R. Brevoort, Geo. Q. Thorndike, R. H. Fuller, A. Wordsworth Thompson are among the other artists who have gained repute in the department of landscape. To these should be added those whose reputation dates from more recent times, and most of whom are quite in sympathy with the art-tendencies of to-day; men like Samuel Coleman, F. H. Shapleigh, F. D. Williams, R. M. Shurtleff, J. Foxcroft Cole (a pupil of Lambinet, and good in color), W. A. Gay, J. A. Brown, James D. Smillie, Geo. H. Smillie, Arthur Parton, J. C. Nicoll, F. Hopkinson Smith, Henry Farrar, John J. Enneking, Frank Waller, D. W. Tryon, H. Bolton Jones, Wm. S. Macy, Bruce Crane, A. F. Bunner, J. H. Twachtman, Joseph Lyman, Carleton Wiggins, Julian Rix, J. Francis Murphy, E. Gay, Harry Fenn, G. H. McCord, and C. A. Platt.

In Frederic E. CHURCH we have a good representative of the school whose work is mainly objective in character. He unites carefulness in detail to breadth of treatment in general. Tropical scenes form the subjects of many of his paintings, but the general public knows him best, perhaps, as the painter of the grand and impressive picture of Niagara. He is a careful, scientific student of nature, whose pictures, it has been said, are good illustrations of the physical geography of the countries in which he has travelled. Louis R. MIGNOT (1831-70) also showed a preference for tropical subjects, which he painted with a fine feeling for color, and Sanford R. GIFFORD (1823-80) had a true eye for striking and phenomenal atmospheric and light effects.

Three landscape-artists, Bierstadt, Hill, and Moran, are specially prominent as having first delineated for us the grand scenery of the West. Albert BIERSTADT, born in Düsseldorf, came to America in infancy and subsequently went back to his native city to study art. After his return to the United States he accompanied Gen. F. W. Lander's exploring expedition in 1858, and made the studies for his paintings of Rocky Mountain scenery. His Rocky Mountains, which created a *furor* in its day, is, however, not a picture of any actual scene, but a typical composition. Bold in treatment, and frequently ambitious in design, his paintings seem at times to show an undue degree of striving after effect. An artist of undoubtedly great originality and power, he is, like Leutze, a true representative of the Düsseldorf school, the merits as well as defects of which characterize most of his works. His earlier paintings, especially, aroused unbounded enthusiasm, and he has received various honors at home and abroad. Thomas Hill has produced some bold and effective paintings of California scenery. One of his pictures deals with the Yellowstone, a subject that has also employed the pencils of Bierstadt and Thomas MORAN. The latter artist's

fine painting of the Grand Cañon of the Yellowstone is in the Capitol at Washington. Moran is an exceedingly clever painter, possessed of a vivid imagination, and well versed in the technique of his calling. Though undoubtedly influenced by his attention to the methods of Turner, his works show him also to be an assiduous and careful student of nature.

The brothers William and James M. HART, both born in Scotland, have also gained an honorable place among our landscape-painters. The younger, James, has introduced cattle into many of his later pictures, with considerable success. Albert F. BELLOWES (1829-1883), who studied in Antwerp and Paris, first became known as a *genre* painter, but later turned his attention to landscape. He was one of the early members of the Water-Color Society, and painted much in water-colors. This medium had not been seriously used by our artists before 1865. In that year a collection of English water-colors was exhibited in New York, which attracted much attention, and seems to have done considerable towards stimulating our artists to turn their attention more to the culture of water-color painting. Their success in this direction was rapid, as is attested by the works of Bellows, W. T. Richards, Henry Farrar, H. W. Ranger, and others.

A leaning towards a more subjective style of landscape-painting, as distinct from the purely objective method that dominated so much of our landscape art, is found in the works of Jervis MCENTEE, who has striven to represent on canvas the sentiments suggested by certain phases of our autumnal scenery, Homer D. Martin, and others. In some of the earlier works of George INNESS there is a tendency to make a careful reproduction of details the first consideration. But his emotional nature caused him soon to adopt a broader style, and a less objective method. His principle became, as he said himself, to reproduce for others such impressions as a scene called forth in his own mind. Though his pictures are unequal in merit, the best of them are impressive, excellent in light and color, and in atmospheric effects. R. Swain GIFFORD, like Inness, has been influenced more or less by the art of France, and is also one of those artists who always leave an impression of his feelings and emotions upon his work. His earlier efforts were in the direction of coast scenes, but he later devoted himself to landscape, and his travels and observations abroad have served but to broaden his style.

In marine painting but little was produced until lately, and that little by foreigners. Thomas BRICH (died 1851) followed this branch of art in Philadelphia, painting especially naval engagements, while another early marine-painter, Salmon, practised his art in Boston. A. VAN BEEST (*d.* 1860), a Dutch artist, won a certain reputation in this line, and John E. C. PETERSEN (1839-74), a Dane, who came to this country in 1865, settling in Boston, was an artist of considerable talent. But perhaps the best of our earlier marine painters was James HAMILTON (1819-78), a native of Ireland, who established himself in Philadelphia. His best-known pictures include *Capture of the Serapis*; *Old Ironsides*; and such weird and phantastic productions as the *Ship of the Ancient Mariner*. They show a strong contrast of subjects, much imaginative power, and a bold and effective style. Bradford and Dix were among the earliest of our artists to cultivate this branch of art. Charles Temple DIX (1838-73), a son of Gen. John A. Dix, produced some promising work, but unfortunately died young. William BRADFORD, of Quaker origin, has painted effective pictures of the coast scenery of the Eastern States, but is known especially through his studies in Labrador, and his paintings of its scenery and icebergs. Edward MORAN, a brother of Thomas, already mentioned, studied under James Hamilton. He is a marine-painter of repute, and has successfully introduced the human figure into some of his paintings. William T. Richards was at first a decided Pre-

Raphaelite, but later acquired greater freedom of handling. Of late years his attention has been directed especially to the painting of marine and coast views. His excellent water-colors show the same careful finish which characterizes his work in oil. W. E. NORTON has shown his talents in compositions like the *Fog Horn* and *Crossing the Grand Banks*, and Arthur QUARTLEY (1839-86), who was originally a sign-painter, succeeded, though self-taught, in placing himself in a few years in the front rank of our marine-painters. Alfred T. BRICHER has produced some fresh and vigorous coast-scenes, and J. C. NICOLL has worked in this field, but like Bricher paints also landscapes. He has more poetic feeling than that artist, however. Francis A. Silva, Frank K. M. Rehn, Wm. P. W. Dana, Harry Chase, R. C. Cox, and S. S. Tuckerman are also favorably known to the public. J. O. Davidson and M. J. Burns have given much attention to book-illustration. One of the most prominent among our marine-painters of to-day is Maurice F. H. DE HAAS, who was court-painter in Holland before he came to America in 1859. His pictures, though broad, are yet sufficiently finished in detail, and a number of strong and brilliant compositions have come from his easel. He has probably had influence on our marine art.

Coming now to animal-painting, we find that in this department our art has not produced much that is noticeable. As a scientific ornithological painter, John J. AUDUBON (1780-1851) held high rank. T. H. HINCKLEY was one of our earliest cattle-painters, but never advanced beyond his first, really promising, attempts. Henry C. Bispham produced some spirited cattle-pieces. William J. HAYS (1830-75) devoted himself with some success to the delineation of the animal world of the western prairies, and Alfred G. Miller painted similar subjects. Arthur F. TAIT, an English artist who has settled in this country, is well known to the public, many of his works having been lithographed and widely circulated. Walter M. Brackett and Gurdon Trumbull are among those who have made the painting of fish a specialty. William H. BEARD has gained a reputation through his pictures of bears and monkeys, in which the weaknesses and foibles of humanity are reflected with caustic satire. His brother, James H. Beard, has also won a respectable position as an animal-painter, as has also his nephew, James Carter Beard, although the latter has devoted himself more especially to book-illustration. Peter MORAN, the third of this artist-family, has been successful in painting sheep and cattle, and James Hart, as has been remarked before, is also favorably known for his cattle-pieces. Thomas Robinson, George Inness, Jr., and J. Ogden Brown have also worked in this field. Miss Fidelia BRIDGES is known by her charming pictures of bird-life. Frank Rogers has had some success in painting dogs, and Henry R. Poore has also produced some good work in this department. R. M. SHURTLEFF, known best as landscape-painter, has introduced deer and other wild beasts into some of his paintings of forest scenery.

In the department of still-life, Raphaelle PEALE, a son of C. W. Peale, was probably the first to practice. George H. Hall (1826-88) and A. J. H. Way have both earned a reputation through their paintings of fruit-pieces. H. W. Parton has been very successful in some of his paintings of flowers, as has also Ellen Robbins. In fact, a large number of ladies have enjoyed a certain degree of success in this department. William W. HARNETT has produced some still-life pieces almost photographic in their truth to nature. John LAFARGE's ideal and brilliant flower-pieces have been much admired. It is as a colorist that he excels, and he has given much attention to decorative art, in which department he has produced some excellent work, notably in Trinity Church, Boston. Francis LATHROP has also distinguished himself in this direction.

Elihu VEDDER has striven to express his emotions

and impressions in his works. Works like the *Lair of the Sea Serpent* have especially aroused much criticism as to their deeper intent and purpose. Vedder is an artist of undoubted strength, who has shown great imaginative power in his paintings, and in his powerfully drawn illustrations to the *Rubaiyat of Omar Khayyam*.

In entering upon the present period of our country's art-development, we find a new force exerting itself, new influences making themselves felt. The influence of France is now manifest. Our art has again made a step in advance. A growing discontent with old methods and conventionalities has found expression to a certain degree in the founding of societies like the American Art Association and the Art Students' League.

William M. HUNT (1824-79) did much to further the cause of American art, and partly by introducing the new art methods practised in France. He studied for a short time at Düsseldorf, and then went to Paris, where he became a pupil of Couture, and was furthermore influenced by J. F. Millet, whose art-methods he was one of the first to discover and to emulate. He worked in genre, portraiture, landscape, and decorative painting, a notable example of his work in the last department being *The Flight of Night* and *The Discoverer*, in the capitol at Albany. In the works of some of the artists already mentioned in this sketch, a leaning towards the progressive spirit of the new movement makes itself strongly felt. Of our figure-painters of to-day, two, especially, have had a most decided influence on our art—Walter SHIRLAW and William M. CHASE, both of whom have been instructors in the Art Students' League. Trained in the school of Munich, Shirlaw has an excellent technical knowledge, paints broadly, and has decided feeling for color-values. One of his most important works, *Sheep-shearing in the Bavarian Highlands*, has been favorably received at home and abroad. Chase has been particularly successful in the painting of single figures like *The Apprentice*, *Waiting for the Ride*, etc., in which he shows a fine sense of color. He has also produced some characteristic portraits. Many of our "younger men" show in their works a thorough sympathy with the present tendencies of our art. Frank Duveneck, William Sartain, Robert Koehler, J. Alden Weir, Winslow Homer, Louis C. Tiffany, A. H. Thayer, A. P. Ryder, Wyatt Eaton, David D. Neal, F. P. Vinton, E. L. Weeks, Henry Bacon, William H. Muhrman, F. A. Bridgman, George Inness, Jr., William Dannat, Geo. W. Maynard, F. D. Millet, E. H. Blashfield, Charles S. Pearce, J. C. Beckwith, T. W. Dewing, Gilbert Gaul, A. Kappes, Hamilton Hamilton, C. F. Ulrich, I. R. Wiles, C. Y. Turner, Robert Blum, Kenyon Cox, H. S. Mowbray, George de Forest Brush, C. C. Curran, Louis Moeller, Fred. Dielman, are among those identified with the new art movement. To these should be added nearly all of the younger landscapists mentioned previously in this article. In realistic portraiture some excellent results have been achieved by Eastman Johnson, Moses Wight, B. C. Porter, J. A. Weir, Thomas Eakins, and John S. Sargent. J. A. M. WHISTLER, who has for many years lived in London, is known chiefly for his experiments in color, and his skill in etching. Will H. Low, Edwin A. Abbey, and Charles S. Reinhart, although they have worked with much success in color, have been more prominent in the department of book-illustration.

As one critic has observed, this new movement should be regarded not so much as an attempt at reform, but simply as another step in advance, another stage in the progress of art in this country. It can, of course, not be said that all the qualities of good art are united in the methods of this new school. With the great advance in technical knowledge there has come in also an undue leaning towards ultra-realism. It remains for the succeeding generation of artists to modify many of these aims and principles, and to raise American art to a still higher level. (F. L. W.)

PALEY, FREDERICK APTHORP, an English classical scholar, was born at Easingwold, near York, England, in 1816. He is a grandson of Rev. William Paley (1743-1805), the celebrated author of *The Evidences of Christianity*, for whom see the *ENCYCLOPÆDIA BRITANNICA*. Frederick graduated at Cambridge in 1838, and was tutor there until 1846, when he became a Roman Catholic. He then retired to London, where he edited with great ability *Æschylus*, *Sophocles*, *Euripides*, *Hesiod*, *Theocritus*, and other classics. He translated into English the tragedies of *Æschylus* and the odes of *Pindar*. He was a friend of Pugin and in early life gave much attention to Gothic architecture. His *Manual of Gothic Mouldings* has passed through several editions. He also published *A Manual of Gothic Architecture* and essays on kindred subjects, and *Greek Wit*, a collection of sayings and stories from the Greek prose-writers.

PALFREY, JOHN GORHAM (1796-1881), historian, was born at Boston, May 2, 1796. His grandfather, Col. William Palfrey (1741-1780), was paymaster-general of the Revolutionary army, and was lost at sea while on his way to France as consul-general. John graduated at Harvard College in 1815, and became minister of Brattle Street (Unitarian) Church in 1818. He was Dexter professor of sacred literature in Harvard College from 1831 to 1839, and edited the *North American Review* from 1836 to 1843. He was a member of the Massachusetts legislature in 1842, and secretary of state from 1844 to 1847. In 1846 he published in the *Boston Whig* a series of articles on "The Progress of the Slave-Power." In 1847 he was elected to Congress as an anti-slavery Whig but served only one term. He was defeated as candidate for governor in 1851, and then retired from public life, devoting himself to literature. He was called forth again in 1861 to become postmaster of Boston, which office he held five years. He died at Cambridge, Mass., April 26, 1881. Besides a History of the church to which he had ministered, and a biography of his grandfather, he published his lectures on *The Jewish Scripture and Antiquities* (4 vols., 1833-52), on *The Evidences of Christianity*, and on the *Relation between Judaism and Christianity* (1854). His most noted work is the *History of New England*, of which three volumes appeared (1858-64), bringing the work down to 1688, the end of the first cycle in the author's division. He then abridged this work into two volumes (1866) and afterwards continued the abridged edition in two more volumes (1872-73), bringing the history down to 1765. His work is written with force, dignity, and impartiality, and gives a faithful picture of the toils and struggles of the people of New England in founding a virtuous republic.

His son, **FRANCIS WINTHROP PALFREY**, born April 11, 1831, graduated at Harvard in 1851, and studied law. In the civil war he served as lieutenant-colonel of a Massachusetts regiment, and was severely wounded. He has published *Antietam and Fredericksburg* (1882) and some other volumes.

PALGRAVE, FRANCIS TURNER, an English poet, was born at London, Sept. 28, 1824. He was the son of Sir Francis Palgrave (1788-1861), the historian of Normandy, for whom see the *ENCYCLOPÆDIA BRITANNICA*. He was educated at the Charter house School and at Balliol College, Oxford, where he graduated in 1844. He was chosen a fellow of Exeter College, and was afterwards vice-principal of a training school at Kneller Hall for five years. He was long employed in the educational bureau of the Privy Council. He has been both author and editor of lyric poems and hymns. His works comprise *Idylls and Songs* (1854); *Hymns* (1867); *Lyrical Poems* (1871); and some publications on art. His collection called *The Golden Treasury of English Lyrical Poetry* (1861) is deservedly famous. He was appointed professor of poetry at Oxford in 1886.

His brother, **WILLIAM GIFFORD PALGRAVE**, was

born at Westminster, Jan. 24, 1826. He was educated at the Charter house and at Trinity College, Oxford, where he graduated in 1846. He was an officer in the Indian army until 1853, when he entered the Roman Catholic Church. Becoming a Jesuit, he studied theology at Laval, France, was ordained a priest and sent as a missionary to Syria. Having become well versed in Arabic and in Mohammedan theology, he went in 1862 in the disguise of a physician through the Wahabite kingdoms of Central Arabia. After his return to Europe in 1863 he left the order of the Jesuits. In 1865 he went to Abyssinia to procure the release of the British prisoners held by King Theodore. He was appointed British consul at Souk-houni-Kalé in 1866, at Trebizond in 1867, at St. Thomas, West Indies, in 1873, at Manilla in 1876, and consul-general to Bulgaria in 1878, and to Siam in 1880. He has published *A Year's Journey through Central and Eastern Arabia* (1865); *Essays on Eastern Questions* (1872); *Hermann Agha* (1872); *Alkamah's Cave* (1875); *Dutch Guiana* (1878).

PALMER, BENJAMIN MORGAN, Presbyterian minister, was born at Charleston, S. C., Jan. 25, 1818. He graduated at the University of Georgia in 1838, and at Columbia Theological Seminary in 1841. He was then ordained pastor of the First Presbyterian Church, Savannah, but two years later accepted a call to a pastorate in Columbia. Here he was also a director of the Theological Seminary, and from 1853 to 1856 was its professor of church history and polity. In 1856 he became pastor of the First Presbyterian Church in New Orleans. He assisted in founding the *Southern Presbyterian Review* in 1847, and has since been one of its editors. He earnestly supported the secession movement and the Confederate cause. In 1861 he was moderator of the first General Assembly of the Southern Presbyterian Church at Augusta, Ga. He published *Life and Letters of J. H. Thornwell* (1875); *The Family in its Civil and Churchly Aspects* (1876); and some volumes of sermons.

PALMER, ERASTUS DOW, sculptor, was born in Onondaga co., N. Y., April 2, 1817. He was a carpenter at Utica, N. Y., for several years, but in 1846 settled at Albany and engaged in cameo-cutting. Finding this occupation injurious to his sight he turned to sculpture, being now thirty-five years of age. His first work was *The Infant Ceres*, modelled from one of his own children. He then made bas-reliefs, *The Morning Star*, *The Evening Star*, *Resignation*, *Peace in Bondage*. Among his full-length figures are an *Indian Girl Finding a Crucifix*, *The White Captive*, and *The Emigrant's Children*. For the Capitol at Washington he made, in 1857, a group of sixteen figures, representing *The Landing of the Pilgrims*, but it was placed in the pediment for which it was designed. Palmer has also made portrait busts of Com. M. C. Perry, Washington Irving, Gov. E. D. Morgan, and others. He did not visit Europe until 1873, when he spent some time in study at Paris. His statue of R. R. Livingston obtained a first-class medal at the Centennial Exhibition. His conceptions are highly poetic, and are wrought out with strict regard to nature. Several of his best works are ideal medallions.

His son, **WALTER LUNT PALMER**, born at Albany, Aug. 1, 1854, studied art in Paris, and settled at New York in 1877, devoting himself chiefly to landscape-painting. In 1882 he removed to Albany. Among his works are *An Editor's Study* (1880); *Venice* (1882); *The Oat-Field* (1884); *January* (1887).

PALMER, JAMES CROKALL (1811-1883), surgeon-general U. S. navy, was born at Baltimore, Md., June 29, 1811. He graduated at Dickinson College in 1829 and studied medicine in the University of Maryland. In 1834 he entered the naval service as assistant-surgeon, and within a year sailed around the world. In 1838 he joined Wilkes's exploring expedition and encountered various perils in the Antarctic regions.

His vessel being wrecked at the mouth of the Columbia River in 1841, he spent some months on shore in scientific work. He was commissioned surgeon on his return to New York, and soon after had charge of the numerous wounded by the explosion on board the U. S. steamer Princeton. He served off the coast of Mexico during the war with that country, afterwards in the Pacific, and on the steam-frigate Niagara during the first attempt to lay the Atlantic cable. At the outbreak of the civil war he took medical charge of the naval academy then removed to Newport, R. I. In 1863 he joined Admiral Farragut's blockading squadron, and he was attached to the flagship Hartford during the battle of Mobile Bay. At the close of the war Dr. Palmer returned to the North with health greatly impaired, but had charge of the naval hospital at Brooklyn for four years. He was commissioned as medical director in March, 1871, and as surgeon-general in June, 1872, but retired a year later. He died at Washington April 24, 1883.

His brother, JOHN WILLIAMSON PALMER (1825-1874), was born at Baltimore April 4, 1825. He graduated at the University of Maryland in 1847, studied medicine, and became city physician in San Francisco in 1851 and surgeon in the East India Company's service in the Burmese war. His graphic sketches of life in California and India were published in *Putnam's Monthly* and the *Atlantic Monthly*. During the civil war he was a Confederate war correspondent of the *New York Tribune*. After the war he was a physician in Baltimore, but in 1870 removed to New York. Among his books are *The Golden Dagon* (1853); *New and Old* (1859); *Folk-Songs* (1860), and some novels and art-books.

PALMER, JOHN McCAULEY, general, was born at Eagle Creek, Scott co., Ky., Sept. 13, 1817. Having removed to Illinois during his youth, he became a lawyer at Carlinville and was elected to the State Senate in 1852-4. He took part in the formation of the Republican party and was presidential elector on its ticket in 1860. In April, 1861, he became colonel of the Fourteenth Illinois volunteers and was engaged in Missouri. He was made brigadier-general of volunteers in December, and took part in the capture of New Madrid. His gallantry at the battle of Stone River, Jan. 1-3, 1863, where he commanded a division, secured his promotion to major-general. He fought at Chickamauga and commanded the Fourteenth corps in the Atlanta campaign. When Gen. O. O. Howard was promoted to the command of the right wing of Sherman's army, on the death of Gen. McPherson, Gen. Palmer, who thought himself entitled to the position, asked to be relieved, and was assigned to the command of the department of Kentucky. He was governor of Illinois from 1869 to 1873.

PALMER, RAY (1808-1887), hymn-writer, was born at Little Compton, R. I., Nov. 12, 1808. He graduated at Yale College in 1830 and engaged in teaching. In 1832 he was licensed to preach in the Congregational Church, and he was pastor of the Central Church, Bath, Maine, from 1835 to 1850. He was then called to the First Congregational Church, Albany, N. Y., and was its pastor until 1866, when he became secretary of the American Congregational Union in New York city. During the twelve years of his secretaryship the society assisted in erecting over 600 church buildings. Dr. Palmer was, during the same period, one of the visitors of Andover Theological Seminary, and was engaged in literary work. In 1878 he retired to Newark, N. J., where he died March 29, 1887. Dr. Palmer is best known as the author of the hymn, "My Faith looks up to Thee," which has been translated into more than twenty languages. Others of his hymns have been widely used. His *Complete Poetical Works* were published in 1876. He also published *Closet Hours* (1851); *Home, or the Undist Paradise* (1868); *Voices of Hope and Gladness* (1880).

PALMETTO is the representative form taken by the palm within the limits of the United States, and probably the most hardy of the palms, since it extends northward as far as the latitude of North Carolina. Two genera and four species of palmetto exist in the region between North Carolina and Florida, the most important of these being *Sabal Palmetto*,

Palmetto Palm.

the cabbage palmetto, a noble palm, which sometimes attains a height of 50 ft. and a diameter of 12 to 15 in. It is crowned with a circlet of fan-shaped leaves of about 5 ft. in length and breadth and having long footstalks. The flowers are small, greenish, and in long racemes, with cup-shaped calyx and 3-petalled corolla, 6 stamens, and a 3-celled ovary. The fruit is a 1-seeded drupe, black, oblong, 4 to 5 in. in length, and not eatable.

This species receives its local name from the cabbage, or circle of unexpanded leaves, which forms one of the most delicious of table vegetables.

The cabbage palmetto is found on the sandy coast regions from Florida to North Carolina, and also occurs in the Bermudas. Its wood is very porous, but is almost imperishable under water, and is not attacked by the teredo. Hence it is much esteemed for wharf-building. The original Fort Moultrie, whose spongy wood received the balls of the British guns without injury, was built of palmetto logs. The leaves are used in the manufacture of hats, baskets, mats, and for various domestic purposes. The root is highly astringent and has been proposed as a tanning material.

The other species of palmetto are of minor importance. *S. serrulata*, the saw palmetto, has a low creeping stem, 4 to 8 ft. long, with bright-green, fan-shaped leaves, which are of use in hat-making. It occurs on the sandy coast soil from South Carolina to Florida.

S. Adansoni, the dwarf palmetto, is destitute of a stem, sending up above the ground only a circlet of fan-shaped leaves, 2 to 3 ft. long. It covers dense patches of ground in the low coast regions from North Carolina to Florida, growing well in marshy places.

Chamærops hystrix, the blue palmetto of Florida and South Carolina, is a hardy dwarf fan palm, with long-petioled, fan-shaped leaves. It grows in shady woods, and is remarkable for the needle-like thorns which, like porcupine quills, grow from the root mingled with the leaves. From these the specific name is taken. The roots of the palmetto are so numerous and strong in some soils as to make plowing difficult and expensive. (C. M.)

PANCOAST, JOSEPH (1805-1882), an eminent surgeon, was born in Burlington co., N. J., in 1805. He obtained his degree at the University of Pennsylvania in 1828, and began teaching practical surgery in 1831. He was connected with the Philadelphia Hospital from 1834 to 1845 and with the Pennsylvania Hospital from 1854 to 1864. He was elected professor of surgery in the Jefferson Medical College in 1838, and in 1847 exchanged this position for the professor

ship of anatomy. Resigning in 1874, he was succeeded by his son, Dr. William H. Pancoast (born Oct. 16, 1835). He was noted for his bold and successful surgical operations, and introduced many improvements which have been adopted by other surgeons. He was especially successful in rhinoplasty, in removal of tumors, and in amputations at the hip-joint. For the latter he devised an abdominal tourniquet. He died at Philadelphia March 7, 1882. He published a *Treatise on Operative Surgery* (1844) which passed through several editions, and revised Wistar's *System of Anatomy* and other works. He also contributed frequently to the *American Journal of the Medical Sciences* and other professional periodicals.

PAPAW (Malay *papaya*), the fruit of *Carica papaya*, a small South American tree, whose fruit, though not very palatable, is eaten. The root of the papaw tree has an offensive odor, and the juice of the fruit, before ripening, contains a remarkable albuminous substance resembling fibrine. This plant is said to have the property of rendering meat tender. Newly killed meat hung among the leaves becomes soft and delicate, and the flesh of hogs and poultry fed on its leaves or fruit becomes remarkably tender.

The name of papaw is also given to *Asimina triloba*, a North American tree of from 10 to 20 ft. in height, and to several smaller species of *Asimina*. The roots

The North American Papaw.

and bark of these trees have an extremely nauseous odor. The ripe fruit is about 3 in. long by 1½ in. thick, of yellowish color and irregular oval form. The pulp is soft and insipid, containing several large seeds. It has no marketable value, though eaten to some extent. The tree grows in the sandy regions of Georgia and Florida. (C. M.)

PAPER. This article is confined to the manufacture of paper in America. The development of the paper-making industry of the United States as to most of its details is of comparatively recent growth, but

not the less noteworthy and remarkable. The first paper-mill in North America was established in 1690 by William Rittinghuysen, whose descendants, under the name of Rittenhouse, perpetuate this Dutch patronymic. Rittinghuysen, associating himself with William Bradford, the Philadelphia printer, built his mill in Roxborough, on Paper-mill Run, near the Wissahickon Creek, and about 2 miles from the Schuylkill River. This locality is now included within the limits of the city of Philadelphia. Twenty years later (1710) the second paper-mill in America was built in Germantown (now also a part of Philadelphia) by William DeWees. The third paper-mill was also started in Pennsylvania in 1728, and in 1730 the first mill in New England was opened at Milton, Mass. By 1770 forty mills were in operation in Pennsylvania, New Jersey, and Delaware; while in 1775, at the out-

break of the Revolution, only four are on record as being located in New England. The first mill in New Jersey was started by Bradford in 1728.

These earliest beginnings were followed by enterprises of a similar kind in the other English colonies, a detailed account of which is unnecessary. The growth of the industry during 120 years is illustrated by the fact that in 1810 there were said to be 185 mills in the United States. Until this time the materials used in paper-making had been solely of home production, but in 1810 rags were first imported from Europe.

In 1817 there is the first record of a paper-making machine in America. This is believed to have been a cylinder machine. The first Fourdrinier machine in use in this country was set up at Saugerties, N. Y., and started by Peter Adams on Oct. 24, 1827. This was followed by others, and some of the most important changes in paper-making mechanism have since that time found birth in America. In 1828 the system of uniting two sheets of paper in the process of formation so as to make a thicker sheet was invented and put in operation here.

Various improvements in paper-making machinery have been made from time to time. The Fourdrinier, while preserving its form and essential principles, has not been neglected, but in many respects has received the benefit of American invention. So, too, with the cylinder machine, which has developed from a single cylinder to two, three, and four cylinders. The Harper improved Fourdrinier, invented by James Harper, of New Haven, is a combination of the Fourdrinier and cylinder machines, the direction of motion requiring that the Fourdrinier shall be turned end for end. It would be impossible, however, to review all of the details of the changes in paper-machines and in paper-making machinery in general. In all of the processes, from the handling of the raw material to the output of the finished product, in the preparation and cleaning of the stock, in the work of boiling, beating, and reducing paper-making fibres to pulp fit for conversion into paper, and in carrying forward the work of manufacture, the skill of the American inventor and artisan has been called into play. Not the least noteworthy fact in this connection is the increase in the speed of the Fourdrinier machine, the rapidity of manufacture in America being regarded with surprise by the paper-makers of other countries. While this machine formerly ran at a rate of speed capable of producing 24 lineal ft. of paper per minute, afterwards increasing to 40 ft., which was regarded as an important advance in manufacture, American machines are now speeded up to the production of 250 lineal ft. of paper, the full width of the machine, and this is not regarded as an extraordinary occurrence except by those who are unfamiliar with American paper-making and its methods.

In the preparation of the pulp much improvement has been gained by the introduction of what are called refining-engines, of which those known by the names of their respective inventors are the type. These embrace the Kingsland engine, the Jordan, the Gould, the Jeffers, and the Marshall, all of which are in use, some of them in Europe, although the introduction of these machines in European paper-mills has been slow, and their employment there for the most part is of recent growth. As adjuncts of the paper-machine and for finishing purposes the calenders, consisting of sets of metal or paper rolls combined in a frame, and forming what is called a stack, have also been the subject of improvements. Chilled-iron rolls are used in these stacks, and one of the most important improvements in connection therewith has been the invention of a machine for grinding the faces of these rolls and rendering them true and perfectly cylindrical. This machine is of American origin, and the only one of its kind. Various devices for use in connection with the calenders, such as calender-feeds, etc., have also originated in the United States, and become recognized

appendages of the machine. As the paper after passing through the calenders has sometimes to be wound and made into rolls, an appendage known as a winding-machine, and by which the paper can be wound into different length, after being cut into widths as it passes from the calenders, has been invented. This winder has several reeling devices automatic in action, and maintains an even tension on each separate strip or web of paper, and in case one strip breaks the other rolls stop until a splice is made of the broken web. Aside from these mechanical improvements noted there are many others. The means for conveying power to the machinery have all been largely improved, but these and many other details must be passed by.

In considering the growth of the American paper industry the results of the introduction of mechanically prepared wood-pulp and of wood-fibre produced by chemical treatment must not be overlooked. The method of grinding wood so as to render it useful as a raw material for paper was introduced in the United States about 1869-70. This was the first great step in the cheapening process for ordinary news- and print-papers, and it has served to bring down the price of the manufactured article so that the product which was sold as late as 1879 at 9 cts. per lb. is now (1888) to be bought for 4 cts., and is at the same time of better quality. This cheapening process has been aided by improvements in pulp-making machinery made by American inventors, but is chiefly due to the growth of this branch of the paper-making industry, aided by a tariff which has encouraged the extension of the industry and increased home competition. The chemical treatment of wood, resulting in what is known as wood-fibre, possessing stronger characteristics than wood-pulp, and which goes into finer grades of paper, was inaugurated in this country in 1854. This consisted in the reduction of the wood to its pure fibre, or cellulose, by boiling and treatment with alkaline solutions. The process is generally known as the soda process, and was first put in operation at Royer's Ford, Pa., where it is still practised, and has since extended to various parts of the country. This alkali or soda process induced many mechanical inventions for its perfection and development. Of late another chemical process of disintegrating wood and separating its fibres so as to adapt them for conversion into paper has come into competition with the alkali process, and with marked influence on the latter. This is known as the bisulphite process, and consists in treating wood under pressure with a solution of sulphurous acid in combination with a base. This is essentially an American invention. It was suggested and patented by Tilghman, of Philadelphia, in 1869, but its costliness prevented its practical application and development at that time. Later, the process was taken up in Europe, and means for conducting it on a profitable basis were perfected, the American process maintaining its position as a foundation principle. This fibre goes into various grades of print- and writing-papers.

There are two other features of American paper-making which have had influence on the industry at large. The first is the manufacture of straw-boards, which was started by G. A. Shryock, of Chambersburg, Pa., in 1829, and is still continued, improvements having been made in this branch of production also. Coated-paper for fine book-work is the other. The elegance attained in the production of illustrations in magazines has been due to a finish given to the surface of the paper by means of a white coating after the paper has been made.

The latest and what promises to be one of the most important changes in paper-making methods has been recently developed. This is the process of bleaching paper-pulp by the employment of electricity, which is utilized to electrolyze the bleaching solution. This is also the invention of an American; first put into successful and practical operation in 1888. It effects a great saving of bleaching material, and insures an economy in manu-

facture which may induce a revolution in the production of what are known as bleaching-powders.

In concluding this condensed review of paper-making in America some further statistics of the trade will be found of interest. There are in the United States about 1100 paper- and pulp-mills. The mills located in other parts of America number 85. These, with those projected, and on which the work of construction has begun, will doubtless make the record for 1888 fully equal to 1200 mills representing this important industry in this hemisphere. There are in the Dominion of Canada 62 paper- and pulp-mills; in Mexico 11 paper-mills; while in all of the remainder of America, including the West India islands, there are only 12 mills.

The value of the paper manufactured in the United States in 1820 was estimated at \$3,000,000, and the business gave employment to 5000 hands. In 1873 the production was 317,387 tons, the capital invested was \$43,500,000, and the help employed numbered 22,042. During the last eight years the American paper industry has advanced from No. 21, as classified among the manufacturing industries of the country in the census tables of 1880, to No. 14 in the same classification, having nearly doubled in value. The following are the statistics of the trade for 1887:

Capital invested.....	\$80,000,000
Tons of paper made.....	1,200,000
Value of product.....	\$95,000,000
Number of hands employed.....	40,000
Wages paid.....	\$18,500,000

The total *daily* producing capacity (in lbs.) of the paper- and pulp-mills of the United States for the years undermentioned is given in Lockwood's *Directory of the Paper-Trade* (14th ed.) as follows: 1881, 5,315,400 lbs.; 1883, 6,949,800 lbs.; 1884, 7,867,830 lbs.; 1885, 8,147,060 lbs.; 1886-87, 8,354,480 lbs.

(J. A. C.)

PAPINEAU, LOUIS JOSEPH (1789-1871), a Canadian politician, was born at Montreal in October, 1789. He was educated at Quebec and admitted to the bar, but did not practice. Elected in 1809 to the provincial parliament, he became the speaker of the house in 1815. Lord Dalhousie tried to neutralize his influence as leader of the French party by making him a member of the executive council, but Papineau would not attend its meetings. When he was again chosen speaker in 1827 Lord Dalhousie adjourned the parliament. Papineau prepared the list of grievances subsequently known as the 92 Resolutions, which he supported in the house and afterwards by speeches throughout the country. He also recommended commercial non-intercourse with England. In 1836 he induced the parliament to vote only six months' supplies to the government, but the measure was vetoed, and the administration conducted without regard to parliament. As long as the French party followed Papineau, their opposition was confined within peaceful limits, but when they took up arms he publicly declared that resistance by constitutional means would alone avail. The rebels were soon defeated and Papineau, who was proclaimed an outlaw, took refuge in the United States. Thence he passed to France, but in 1847 he returned to Canada under the amnesty of 1840, and was again elected to parliament. Though he retained his popularity, he did not resume his leadership. In 1854 he retired from public life, and he died at Montebello, Sept. 23, 1871.

PARDOE, JULIA (1806-1862), an English author noted for abundance of her literary labor, was born at Beverley, Yorkshire, in 1806. At the age of 13 she had produced a volume of poems, and at 15 a novel. Her travels on the Continent and residence at Constantinople furnished material for descriptive works and romances. In 1859 she received a literary pension from the British government. She died Nov. 26, 1862. Her most important works were *Traits and*

Traditions of Portugal (1833); *City of the Sultan* (1836); *Romance of the Harem* (1839); *City of the Magyar* (1840); *Louis the Fourteenth* (1847); *Court of Francis I.* (1849); *Episodes of French History* (1859).

PARDON. In addition to what is said in the *ENCYCLOPÆDIA BRITANNICA*, Vol. XVIII., p. 271 (p. 276 Am. Rep.), it will suffice to mention that the rule or usage in the several States of the American Union in regard to the exercise of the pardoning power may be found in the second part of the article *CONSTITUTION*, treating of the "State Constitutions."

PAREPA-ROSA. See *ROSA*.

PARIS, LOUIS PHILIPPE D'ORLEANS, COMTE DE, was born in Paris, Aug. 24, 1838, being the eldest son of the Duke of Orleans and grandson of King Louis Philippe. He was educated by Adolphe Regnier, at Paris, and after the Revolution of 1848 at Eisenach. He became proficient in foreign languages and travelled extensively. In 1860 he went with his brother, the Duc de Chartres, to Syria, and published *Damas et le Liban* (1861). The brothers came to America after the outbreak of the civil war, and in September, 1861, were placed on the staff of Gen. McClellan. They remained with him until after the failure of his campaign against Richmond, when they retired to escape the complications growing out of the French operations in Mexico. On the declaration of war between France and Prussia, the Comte de Paris applied for permission to enter the French army, but was refused. In 1873, by his visit to the Comte de Chambord, at Frohsdorf, the breach between the two branches of the former royal family was healed. On the death of Chambord in 1883 the Comte de Paris was recognized as heir to his pretensions to the throne of France. Yet he lived under the Republic, at Paris, or at his Château d'Eu, and held the rank of lieutenant-colonel in the army until 1886. He was then obliged to withdraw from the country, and in November, 1887, he issued an address advising the French people to restore the monarchy. His literary ability was shown first in contributions to the *Revue des Deux Mondes* of articles on various public questions. With his brother he published *Duc d'Orleans, campagnes de l'armée d'Afrique*, 1835-39 (1870). His most important work is the *Histoire de la Guerre civile en Amérique* (6 vols., 1874-84), of which an American edition has been issued, translated by Dr. Henry Coppée. Though not free from errors, it is the best history of the war yet published.

PARK, EDWARDS AMASA, theologian, was born at Providence, R. I., Dec. 29, 1808. He graduated in 1826, at Brown University, where his father, Calvin Park (1774-1847), was professor, and in 1831 at Andover Theological Seminary. He was pastor of the Congregational Church at Braintree, Mass., four years, and then became professor of moral and intellectual philosophy in Amherst College. In 1836 he was made professor of sacred rhetoric at Andover, and in 1847 professor of Christian theology, which post he held forty-four years, resigning in 1881. He was a foremost representative of what is called New England theology. He was active in literary work, and was one of the founders and editors of the *Bibliotheca Sacra*. He edited the works of W. B. Homer (1842), B. B. Edwards (1853), S. Hopkins (1852), and N. Emmons (1861), and wrote the accompanying memoirs, and also published biographies of other divines. To the *Discourses and Treatises on the Atonement* (1859) he furnished an introduction on *The Rise of the Edwardian Theory of the Atonement*. With Dr. Austin Phelps he edited *The Sabbath Hymn-Book* (1858), and *Hymns and Choirs* (1860). After his retirement he published *Discourses on Theological Doctrines as related to Religious Character* (1885).

PARKE, JOHN GRUBB, general, was born near Coatesville, Pa., Sept. 22, 1827. He graduated at West Point in 1849, and entered the topographical engineers. His principal work was on the north-west

boundary survey until the outbreak of the civil war. In November, 1861, he was made brigadier-general of volunteers, and took part in Gen. Burnside's expedition to North Carolina. In August, 1862, he accompanied Gen. Burnside when he joined the Army of the Potomac, served as his chief of staff at South Mountain and Antietam, and continued in the same position when Burnside took command of the whole army. After the battle of Fredericksburg, Gen. Parke had command of the Ninth corps in its march to Vicksburg, and commanded the left wing of Gen. Sherman's army at Jackson, July 12, 1863. When Gen. Burnside resumed command of the Ninth corps, Gen. Parke had a division and was engaged in the defence of Knoxville. In the campaign of 1864 against Richmond he again assumed command of the Ninth corps and took part in various operations until Gen. Lee's surrender. In 1864 he had been made major in the Engineer corps, and after the close of the war he was engaged in the office of the chief of that corps. He rose to the rank of colonel in 1884, and in June, 1887, was made superintendent of West Point Academy.

PARKER, AMASA JUNIUS, jurist, was born at Sharon, Conn., June 2, 1807. Removing to New York in early life, he became a teacher, and in 1825 graduated at Union College. In 1828 he was admitted to the bar and formed a partnership with his uncle, Amasa Parker, of Delhi, N. Y. In 1833 he was elected to the State legislature, and in 1837 to Congress, where he served one term. In 1844 he became vice-chancellor of New York, and later a judge of the State Supreme Court. In 1859 he was appointed U. S. district attorney. He was afterwards member of State constitutional conventions but held no office. He was active in procuring reform in the procedure of the courts of New York. He published 6 volumes of *Reports* (1855-69), and assisted in preparing the *Revised Statutes* (3 vols., 1859).

PARKER, FOXHALL ALEXANDER (1821-1879), commodore, was born in New York city, Aug. 5, 1821, being a son of a naval captain of the same name. He graduated from the naval school in 1843, and served against the Seminole Indians, on the Coast Survey, and in the Mediterranean squadron. On the outbreak of the civil war he was made executive officer at the Washington navy-yard and he frequently gave assistance to the operations of the army in that vicinity. With the rank of commander in 1862, he was engaged off Wilmington, Yorktown, and Charleston, having charge at the latter of a naval battery on Morris Island. Afterwards he commanded the Potomac flotilla till the close of the war, and was promoted to be captain for his services. In 1872 he was made chief-of-staff to the North Atlantic fleet and from 1873 to 1876 was chief signal officer of the navy. In 1878 he was appointed superintendent of the Naval Academy. He died at Annapolis, Md., June 10, 1879. He published treatises on howitzers and naval tactics which are used as text-books in the U. S. Naval Academy. He also translated from the Spanish *Elia, or Spain Fifty Years Ago* (1866), and published *Fleets of the World; the Galley Period* (1876); and the *Battle of Mobile Bay* (1878).

PARKER, JOEL (1795-1875), jurist, was born at Taffrey, N. H., Jan. 25, 1795. He graduated at Dartmouth College in 1811 and became a lawyer at Keene, N. H. In 1833 he was made a judge of the State Supreme Court and in 1838 became chief-justice. In 1840 he was chairman of a committee to revise the laws of New Hampshire, and in 1847 was made professor in Harvard University. He died at Cambridge, Aug. 17, 1875. Among his numerous publications were *Personal Liberty Laws* (1861); *War Powers of Congress and the President* (1863); *Revolution and Reconstruction* (1866); *The Three Powers of Government* (1867); *Conflict of Decisions* (1871).

PARKER, JOEL, D. D. (1799-1873), was born at

Bethel, Vt., Aug. 27, 1799. He graduated at Hamilton College in 1824, and was ordained to the Presbyterian ministry in 1826. He had charges in Rochester, New Orleans, Philadelphia, New York city, and Newark. He was president of Union Theological Seminary, 1840-42, holding also the professorship of sacred literature. He died at New York, May 2, 1873. He published several religious works and was for a time editor of the *Presbyterian Quarterly Review*.

PARKER, JOSEPH, English Congregationalist preacher, was born at Hexham, April 9, 1830. He was educated at University College, London, and was ordained pastor of a Congregationalist church at Banbury in 1853, and afterwards ministered to a church in Manchester. Since 1869 he has been pastor of City Temple, London. In theology he is conservative and orthodox; as a preacher he has been considered to resemble Henry Ward Beecher, and on the death of the latter Dr. Parker was invited to preach his memorial discourse. He accepted the task but afterwards returned to his work in London. Among Dr. Parker's publications are *Emanuel* (1859); *Ecce Deus* (1868), a reply to *Ecce Homo*; *The Paraclete* (1874); *Ad Clerum* (1870); *The Priesthood of Christ* (1876); *The Inner Life of Christ* (3 vols., 1881-2); *Apostolic Life* (3 vols., 1882-4). He has commenced the publication of a series of discourses under the title *The People's Bible*. His sketches of ministerial life, *Springdale Abbey* (1869), and *Tyne Chylde* (1883), are partly autobiographic.

PARKER, PETER (1804-1888), missionary, was born in Framingham, Mass., June 18, 1804. He graduated at Yale in 1831, and having studied medicine as well as theology, was ordained in 1834 and sent as missionary to China. He established a hospital at Canton which received 2000 patients in its first year. Many Chinese also received instruction in medicine and surgery from him. He visited the United States in 1840, but resumed his missionary work in 1842. As secretary to the U. S. embassy he rendered valuable service. In 1855 he again visited the United States, but soon returned to conduct negotiations with the Chinese government. In 1857 he returned to the United States and fixed his home at Washington. He was an active member of the Evangelical Alliance, and in its behalf visited the Emperor of Russia in 1871. He died at Washington, D. C., Jan. 10, 1888. He published *Journal of an Expedition from Singapore to Japan* (1838).

PARKER, WILLARD (1800-1884), surgeon, was born at Lyndeborough, N. H., Sept. 2, 1800. He graduated at Harvard College in 1826, and studied medicine and surgery under Dr. J. C. Warren. He was soon made professor of anatomy in the Vermont Medical College and in Berkshire College, and in 1836 was called to Cincinnati. After a visit to Europe he was in 1839 made professor of surgery in the New York College of Physicians and Surgeons. During the thirty years in which he held this position he made several improvements in practical surgery, including the operation of cystotomy. In 1846 he was concerned in the organization of the Bellevue Hospital, and was appointed one of its visiting surgeons. In 1864 he exerted himself to procure the formation of the New York City Board of Health and afterwards served as one of its members. In 1865 he was made president of the State Inebriate Asylum at Binghamton, and in 1869 was made professor of clinical surgery in the institution with which he had long been associated. He was also consulting surgeon to several New York hospitals, and a hospital for contagious diseases was named in his honor. He retired from practice in 1882, and died April 25, 1884. His only publications were contributions to medical journals.

PARKERSBURG, a city of West Virginia, county-seat of Wood co., is on the Ohio River at the mouth of the Little Kanawha, about 95 miles below Wheeling and 196 miles from Cincinnati. Its railroads are

the Baltimore and Ohio, the Ohio River, and the Cincinnati, Wheeling, and Baltimore; there is also a branch road to Marietta. The Baltimore and Ohio Railroad bridge over the Ohio is one of the longest in the United States. Parkersburg has a U. S. government building, 3 hotels, 4 national banks, 1 daily and 4 weekly newspapers, 12 churches, 6 public school buildings, and a female seminary. It has 3 foundries, 2 machine-shops, railroad repair-shops, 5 large oil-refineries, and several factories, producing furniture, barrels, veneer, acids. There are 4 flour- and 3 lumber-mills. Parkersburg has gas- and water-works, a good fire department, and a park. Its public debt is \$125,000 and its yearly expenses \$45,000. It is the centre of the petroleum trade of West Virginia and South-western Ohio. It was settled in 1773 by Virginians, was incorporated in 1820. The population in 1880 was 6582.

PARKMAN, FRANCIS, historian, was born in Boston, Sept. 16, 1823. His father, Francis Parkman, D. D. (1788-1852), was pastor of the New North Church (Unitarian) from 1813 to 1849, and was noted for his charitable labors. The son graduated at Harvard in 1844 and then made a tour across the Western prairies, which he described in sketches first published in the *Knickerbocker Magazine*. He afterwards visited Europe. Though afflicted with partial blindness, he followed the example of Prescott and devoted himself to historical investigation. The first result appeared in his *History of the Conspiracy of Pontiac* (1851), to which his familiarity with actual Indian life gave special value. He then essayed a novel in 1856, but his subsequent works, which have brought him fame, have all related to the history of the French in North America. They comprise *The Pioneers of France in the New World* (1865); *The Jesuits in North America in the Seventeenth Century* (1867); *The Discovery of the Great West* (1869); *The Old Regime in Canada* (1876); *Count Frontenac and New France under Louis XIV.* (1880); *Wolfe and Montcalm* (1885). These successive volumes by their graphic style, their thorough research, and careful judgment, have become standard works on that part of American history to which they relate.

PARKS. The idea of providing pleasure-grounds for the recreation of the people of large cities is one of recent origin, though it is now being carried out with all the Nineteenth century energy. In former times the people were looked upon as of too little importance for any public provision to be made for their enjoyment, and though large tracts of forest and other lands were set aside, they were held solely for the pleasure of the nobility and royalty. Many such tracts of crown lands have recently been utilized as parks for the people, a striking evidence of the growing importance of the populace. This is particularly the case in France, where numerous preserved portions of the ancient forests are now thrown open as public pleasure-grounds.

In the old English manors the grounds were divided into two portions. One of these immediately surrounded the house, and was treated as a garden or an elaborately ornamented pleasure-ground. The more distant portion, known as the park, was less artificially treated, being left principally to the broad handling of nature. Most of these old parks were originally kept as deer enclosures, and had the proper alternation of open forest, grassy dales, and flowing streams for this purpose. In many of the manorial parks the people were given privileges, and in some of them they acquired legal rights of crossing, but no park existed in the modern popular sense.

The recent European parks are as a rule old private parks, or crown lands, now made free to the people and adapted to public use. For this purpose they have been treated so as to bring out all their possibilities of landscape beauty, being in some parts dealt with elaborately as gardens, but usually on a broader

and freer scale than that suitable to landscape gardening. It is the design in the park, indeed, to give a suggestion of the open country, not of the contracted house grounds, and for this it needs to be of considerable extent, and to embrace woodland, open meads, glens, elevations, small lakes, flowing streams, and all that constitutes and enhances the charm of attractive landscapes. All this, of course, is necessarily done on a small scale, except in the few parks of enormous dimensions, and the effort to improve the natural advantages to the utmost leads usually to an artificial arrangement which is far removed from the work of nature, but which is, perhaps, more pleasing to city eyes.

Of European cities, Paris and London are the best provided with parks. In France, as we have already said, the ancient state forests have been utilized for this purpose. There are more than 20 such domains open to public use, within easy reach by rail of Paris, varying in size from St. Cloud, of 1000 acres, to the great forest of Fontainebleau, with its 81,740 acres and its thousands of miles of roads and paths. Some of these possess much natural beauty, such as fine old trees, stretches of beautiful lawn, winding streams, picturesque scenery, etc. They have already been adapted to the enjoyment of many generations of kings and nobles, and need little further change to make them suitable for the recreation of the people. Of those within ten miles of Paris the parks of Boulogne, Vincennes, St. Cloud, Marly, and St. Germain are among the most notable. Versailles is yet more famous, being admired for its palace and gardens more than for its woodland scenery. The real parks of Paris, however, are Boulogne (2158 acres), and Vincennes (2225 acres). These are near the city, and form the chief daily recreation-grounds of the people. The Bois de Boulogne is not well adapted by nature for park purposes, being level and with poor soil, yet it has been much improved in the portions adjoining the great avenues which traverse it. There are in addition several small parks of from 40 to 75 acres, and numerous city squares.

London is abundantly supplied with parks and small breathing-spaces, which are well distributed throughout the city, and comprise in all a very considerable area. In the West End, for instance, occur Hyde Park (390 acres), Regent's Park (470 acres), Kensington Gardens (360 acres), Green Park (70 acres), St. James Park (80 acres), and several smaller places. The other quarters of the city are equally well provided, while outside the metropolitan limits are numerous places of public resort, among them several of great extent. Epping Forest, now set aside for public use, contains 5600, Richmond Park 2253, and the more distant Windsor Park 3800 acres.

The other cities of Europe, while not equally well provided with public pleasure-grounds, have their parks, some of them quite extensive, and are adding to their advantages with commendable rapidity. One of the later ideas in this direction is the formation of broad drives or parkways, adorned with trees and grassy margins, walks, drives, and seats, and so laid out as to form trunk-lines of traffic, with the interior streets as feeders. Paris has taken the lead in this conception, and has over 80 miles of such avenues, from 100 to 300 feet wide. In all this city has 120 miles of tree-lined boulevards.

In the above respects Europe is in advance of the United States, in which the park idea is only about 30 years old, though it has been carried out since its inauguration with that activity which forms a distinguishing American characteristic. In planning the city of Philadelphia William Penn provided five breathing places for the inhabitants, which have recently been much improved, though the largest one of them, indeed, has been swallowed up as a site for the new City-Hall. Boston took a similar step as early as 1634, by laying aside the Common as a public garden, though it long continued unimproved, and was used as a cow-pasture

within the memory of living men. This small enclosure of 48 acres, with a smaller recent addition, is all that Boston yet possesses in the way of a park, though steps are now being taken to provide a series of public pleasure-grounds on a scale more in accordance with modern ideas.

The idea of the formation of Parks on a large scale in American cities seems to have originated with A. J. Downing, (*q. v.*) of New York, or at least he was the first to openly advocate it in some articles written in 1850, in which he suggested the need of a great public park in New York city. This suggestion quickly bore fruit, for in the succeeding year the mayor of that city strongly recommended the establishment of a park, and in 1853 an act was passed setting aside the locality of the present Central Park for that purpose. Another locality, known as Jones's Woods, was also named, this being a large and well-wooded tract along the East River, opposite Blackwell's Island. It had better natural advantages, but was of smaller size than the Central Park tract, and was finally abandoned in favor of the latter, which was purchased at a cost of \$5,160,369.90. The tract of land thus set aside is 2½ miles long by half a mile wide, and contains, with some later additions, 683 acres. It extends from 59th to 110th streets and from Fifth to Eighth avenues on the city plan, these streets, which were then open ground, having since been solidly built up, so that the park is now completely embraced by the city. One awkward feature of the locality is the existence of the two Croton reservoirs, of 150 acres in extent, which are so situated as to divide the park tract into two portions, with but a narrow line of connection, and have been a serious detriment to its full adaptation to public use.

Plans for its improvement were advertised for, the accepted one being that offered by F. L. Olmsted and Calvert Vaux, gentlemen well suited by their former studies for the proper execution of the task thus assigned them. The ground chosen for the park was by no means well adapted by nature for such a purpose. Only a few slight elevations broke its general flatness, and it presented an aspect of barren ugliness from which it seemed a hopeless task to seek to work out a scene of beauty. But by the free expenditure of money and the employment of all the resources of the landscape gardener, Central Park has been made exceedingly attractive, there being few prettier places of resort, for its extent, on the continent. The lower park (that portion below the reservoirs) was necessarily treated artificially, and is rather an extensive garden than a park in any broad sense. A rocky ridge of some slight elevation traversed it, and the ground has been handled with great skill, bringing out in full all its possibilities of improvement. Through its reaches of umbrageous vegetation and broad stretches of greensward runs a wide avenue, the Mall, which is adorned with much fine statuary, and leads to the Terrace, a very handsome architectural feature of the park, ornamented with elaborate carvings and an attractive fountain which overlooks the lake. The latter is a winding sheet of water, managed with the utmost skill, and for its extent perhaps the most attractive bit of water scenery in any American city park. Beyond the lake extends the Ramble, a hilly slope leading to the reservoir, which has been treated with less artificiality, and made to resemble an expanse of undulating woodland.

The upper park, which is connected with the lower by a narrow strip running along the reservoirs, has been differently treated. Its natural advantages were superior, and a broader handling was adopted, without the architectural adornments which constitute a leading feature of the lower section. On the whole it may be said that a very unpromising piece of land has been managed with great skill, and all its possibilities of landscape effect fully brought out.

To the attractions proper to the park have been added others of a very useful character. One corner

of it is occupied by a Zoölogical Garden on a small scale, while in another has been erected the Metropolitan Museum of Art, whose collection of art objects has no equal, free to the public, in this country. Among its treasures are the invaluable Cesnola collection of Cypriote antiquities and large numbers of costly paintings and statues, most of which have been recently contributed to the Museum. Near this edifice stands the Egyptian obelisk, a fine example of the monolithic marvels of Egypt, which was brought from its original seat and erected in Central Park a few years ago. To these attractions may be added the Museum of the Natural History Society, erected on the edge of the park, and well filled with geological and zoölogical specimens.

In addition to Central Park the city of New York possesses about 30 small breathing spaces, and the recently laid out Riverside Park, which extends along the North River from 72d to 129th street, and is notable as the site of Gen. Grant's tomb. Since the great extension of the park idea in other cities, many propositions have been made with the view of providing New York with parks on a larger scale. The topography of the city did not accord well with this desire, most of the suggested places being at distances out of easy reach by the citizens. But the extension of the elevated railroads has gone far to overcome this difficulty, and a proposition has been adopted to lay out a series of large parks on the mainland north of Harlem River. The Legislature has authorized the purchase of the necessary land, and the Commissioners appointed to consider the subject reported in 1888 as follows: It is proposed to purchase certain old estates, comprising in all 3800 acres of land, at an estimated cost of \$9,591,961, being an average of \$2500 per acre. This territory divides up naturally into five parks, of which St. Mary's, the smallest and nearest the city, contains but 25 acres. Van Cortland, the most central of the new parks, will be of nearly 1100 acres area, and is to have a rifle-range and a military parade-ground. It contains that territory which formed the "neutral ground" between the British and American forces in the Revolution, and is the scene of Cooper's novel of *The Spy*. Pelham Park, the largest of the group, is 1700 acres in extent, situated on Long Island Sound outside the city limits, and will have a series of drives for three miles along the water-side. Croton Park contains 135 acres of high land, which affords many fine views. Bronx Park derives its name from Bronx River, which runs through it. It is the most picturesque of the series, having many old trees and moss-clad rocks, while the banks of the river are abrupt and precipitous, and capable of effective handling. It is designed to establish zoölogical and botanical gardens on a large scale in these parks, and connect them by parkways from 300 to 600 ft. wide, and kept in the best of condition as pleasure-driving roads. This series of parks, if completed on the broad and generous plan designed, and made practically one by the broad connecting boulevards mentioned, will place New York at the head again in respect to park area, a position which it has lost by the enterprise of other cities.

In connection with the New York parks may be named Prospect Park, of Brooklyn. This tract of land, of 550 acres in extent, was far better adapted by nature than Central Park for picturesque treatment, and has been handled in such a manner as to make it a very attractive place of public resort. Its fine views are not the least of its attractions. Recently a number of boulevards, 200 ft. wide, have been laid out, leading to the park from various directions.

Philadelphia is highly favored in possessing in Fairmount Park the largest public pleasure-ground existing in any city on this continent, and in its natural adaptation to the purpose without an equal in any of the parks of the world. The original design of Fairmount Park was utilitarian, the land being purchased with the

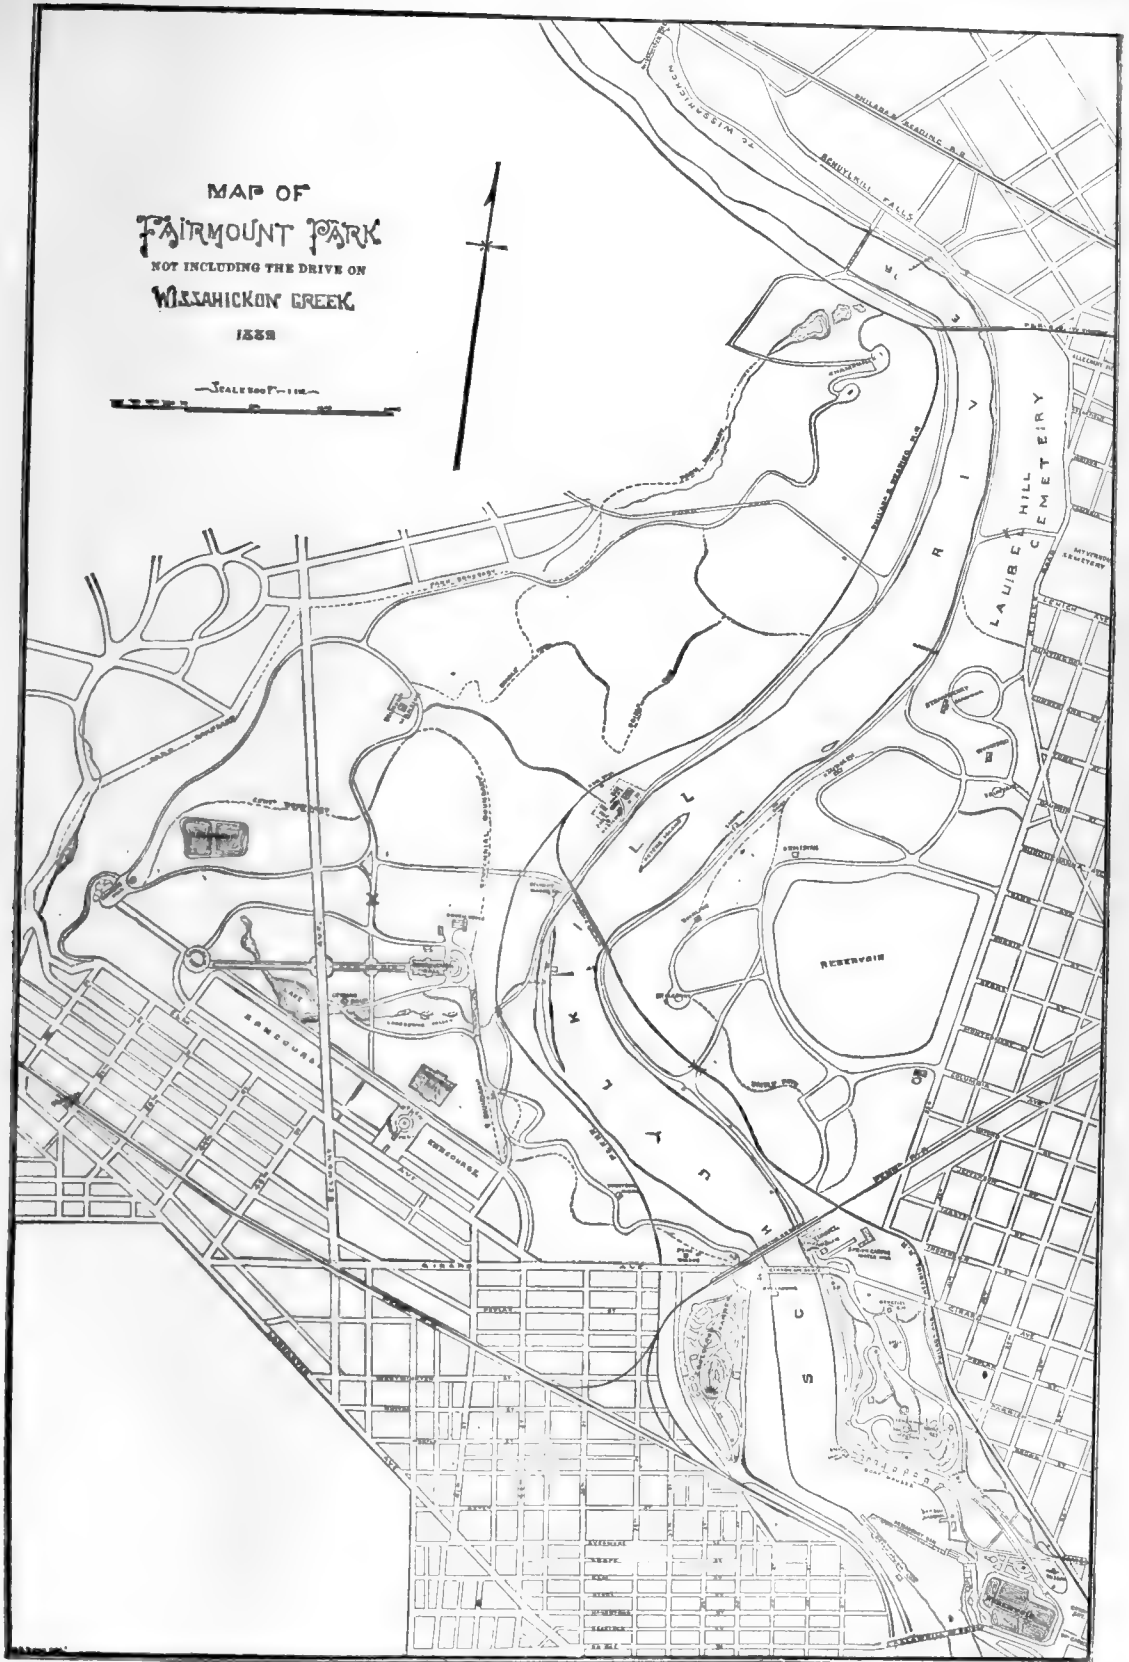

design of preserving the waters of the Schuylkill, the drinking water of Philadelphians, from pollution. By purchase and gift, extending from 1844 to 1867, a very large tract of land was gradually acquired, containing in all 2740 acres, and constituting the largest civic park in the world with the exception of the Epping and Windsor forests near London and the Prater at Vienna. This tract of land is exceptionally well adapted by nature for park purposes. Instead of the miniature lakes of other parks it embraces a section 5½ miles in length of a broad and winding river, on which steamboats convey passengers to its most remote localities, while innumerable pleasure-boats dot its surface. The park embraces the elevated banks of the Schuylkill, and the rolling country for a considerable distance back, through which cut a number of deep and picturesque glens, traversed by rippling streams of water. In addition there are many noble old trees and several extended groves, the original site having been well wooded. Between these extend broad stretches of turf, while elevations of considerable height yield magnificent views of city and country scenery, perhaps unequalled for picturesque beauty in any other park in the world. Taken as a whole the natural attractions of this section of the park are so decided that art has been able to do little more than to open them up by walks and drives to easy access, and nature has been left in great part to her old possession of the ground.

A unique feature of Fairmount Park is that known as the Wissahickon Glen. Here through six miles of length a picturesque stream flows between lofty, precipitous, and rugged banks, which are thickly clad with forest trees, and present at every turn in the winding ravine views of wild and romantic beauty. It has many of the features of a mountain glen, in strong contrast to the more quiet charms of the lower park, and is a scenic element without rival elsewhere in the parks of the world.

Fairmount Park was the site of the great Centennial Exposition of art and industry, to which 465 acres were devoted, and which has left as permanent adornments the massive Memorial Building, with its treasure of objects of industrial art, and the ornate Horticultural Hall, which is surrounded by an extensive landscape garden, and is filled with the choicest representatives of tropical vegetation. Another feature of interest is the Zoölogical Garden, the largest and best provided in the country, and the most attractive in the artistic adornment of its grounds.

Baltimore has been fortunate in securing in its Druid Hill Park a most attractive locality, unsurpassed for its natural scenery, and diversified with dells, glens, streams, lawns, and lakes, the native beauties of all of which have been fully brought out by the skilful handling of landscape artists. Druid Hill, acquired in 1860, was originally a beautiful old wood, of 450 acres, which has been added to till the park now embraces 693 acres. As modified and improved there is no more attractive pleasure-ground, of its size, in America. Recently, by the gift of a merchant, Baltimore has acquired a new park, known as Patterson Park, originally of 56 acres, but now increased to 112.

Washington, the national capital, is well provided with park facilities. The wheel-like or rather spider-web character of the streets of that city has necessarily left many small openings to which have been added several tree-planted spaces of larger dimensions. But the chief park ground of Washington is that which surrounds the Capitol and extends through the heart of the city to the President's house, a refreshing expanse of green which is but a step removed from the principal avenue. This expanse is flat and devoid of natural beauty, and owes its main charm to the labors of the landscape gardener, but it has been rendered very attractive and is certainly very convenient of access to the tired Washingtonian. At one extremity it is adorned with the towering Washington Monument, while centrally situated are the Smithsonian

Institution and the extensive National Museum, with their immense collections of objects of nature, art, and industry.

Passing to the western cities we find Cincinnati not very extensively provided with public pleasure-grounds. Eden Park, on a hill in the eastern part of the city, contains 216 acres, and is an attractive place of resort. Burnet Woods, recently purchased for park purposes, contains 170 acres, mostly forest land. In addition there are several small city parks, containing 25 acres in all, the total park area being but little over 400 acres.

St. Louis is far better provided. It possesses nearly 2100 acres of park lands, embraced in 19 separate parks and squares. The most extensive of these is Forest Park, of 1372 acres. There may be named in addition Tower Grove Park, 266 acres; O'Fallon Park, 158 acres; and Carondelet Park, 180 acres. To these must be added the handsome and attractive Shaw Botanical Gardens, of about 276 acres in extent, and embracing the most extensive botanical collection in the United States. These valuable gardens have been donated to the city.

On the Pacific coast San Francisco possesses, in addition to several small squares, the Golden Gate Park of 1043 acres which extends to and along the ocean beach. Much of this is a bleak and sandy stretch of land, presenting none of the ordinary advantages of park localities. About one-half of it has been handsomely laid out in walks, drives, lawns, etc., its greatest attraction being a magnificent conservatory building, modelled after the Royal Conservatory at Kew, England, and well filled with exotic plants. The remainder of the tract, that bordering on the ocean, remains unimproved, and is of an inviting character for park treatment. It will need to be handled with much skill to bring out its possibilities of landscape beauty.

Chicago needs special mention from having inaugurated a park idea of its own, or one borrowed in part from Europe, which has been carried out with the energy for which the Chicagoans are celebrated. The lands surrounding this city are very poorly adapted for park purposes. With flat ground, poor soil, and a deficiency of trees and of the ordinary features of natural beauty except in the vicinity of Lake Michigan, the promise was far from good, yet the result, as shown in Chicago's chain of parks, is very beautiful and attractive. A series of parks have been thrown in a semicircle round the city, touching the lake at each extremity, and so connected by wide, tree-lined boulevards as to form virtually a single park, a system which, as we have already said, is designed to be adopted in the new parks of New York city.

In the southern district, outside the city limits, are the two South Parks, respectively of 372 and 593 acres, the larger having 1½ mile of lake front. It is designed to form in the latter a series of internal park lakes connected with Lake Michigan. North of these is the East or Jackson Park, of 600 acres, and 2 miles of lake front. It is designed in the future to connect this with the South Parks by a grand boulevard, 600 ft. wide. In the western division of the city lie three parks, the first being Douglas Park, 171 acres in area, and connected with the South Park system by a boulevard 9 miles long. Next comes Garfield Park (185 acres), and Humboldt Park (194 acres). Three and a half miles from the latter lies Lincoln Park, touching the lake north of the city, and completing the semicircle. This is the oldest and most elaborated of the parks. It contains 310 acres, has 2 miles of frontage on Lake Michigan, and contains a zoölogical garden, with beautiful flower-beds and groves of native trees. In addition to these there are many small parks within the heart of the city. The parks, with the exception of Jackson Park, are connected by broad boulevards, from 200 to 250 ft. in width, which unite the whole system into one. These

are reserved for carriage driving, their total length being 40 miles.

Others of our cities have park systems resembling that of Chicago. Buffalo, for example, has an inland park of 300 acres, from which rural promenades lead in one direction to an esplanade over Lake Erie, in the other to a parade-ground and public garden. The total park area is 530 acres.

The new park system of Boston is designed on the Chicago plan. It will begin with the Charles River embankment, an esplanade of 200 ft. wide and extending 2½ miles along the river side. Next will come the Back Bay Park, of about 106 acres; the Muddy River improvement, of 110 acres; Jamaica Park, comprising a pond of 70 acres and a surrounding driveway of 52 acres; the Arnold Arboretum, of 167 acres; and the West Roxbury Park, of 485 acres. This will make a system of parks, connected by broad parkways 8 miles in length, and with an aggregate area of 1059 acres. The land has been purchased, but years must elapse ere the scheme can be completed. Besides the above several other parks are designed, which will make the Boston park system, when finished, a very complete one.

Of Northern cities, not above named, it may be stated that Detroit possesses a park of unusual character, as occupying an island in the middle of Detroit River. This park, Belle Isle by name, is of 700 acres area, with a bridge leading to the main land, with which it is designed to connect a boulevard 9 miles long and 150 ft. wide, curving in a crescent around the city. Cleveland possesses 93 acres of park lands, with plans for additional ones. Milwaukee has a park on the lake front with a fine view over the lake from an elevation of 80 to 100 ft. New Haven has a park of 350 acres on the summit of East Rock, on the highest point of which rock is erected a soldiers' monument of 125 ft. height. In the city of Lynn, Mass., a movement is on foot to secure the forest lands of North Lynn, 3300 acres in extent, for a public park; a project of very ambitious dimensions for a city of 45,000 inhabitants.

The cities of the South have been less active than those of the North in providing large public pleasure-grounds, though many of them are well provided with small squares. New Orleans is dotted over with such squares and has, in addition, the tastefully decorated New City Park of about 150 acres in area, which lies on the river near the north-eastern boundary of the city. The World's Fair and International Cotton Exhibition of 1884-5 was held here, the buildings covering a considerable portion of the area. It was at that time unimproved, though possessed of natural ornaments in the form of live-oak trees with depending drapery of Spanish moss, but for the purpose of the exhibition it was laid out in grass plats and planted with temperate and semi-tropical plants and shrubs, while fountains, bridges, electric lights, and other features of attractiveness were added. The city squares, about 9 in number, are partly improved, though some of them remain in a state of nature. Of these Jackson Square, on the river front, is the favorite resort. It is handsomely laid out with trees and shrubbery and in its centre stands Mills' equestrian statue of General Jackson.

The city of Charleston is very deficient in public grounds and the misfortunes of fire and earthquake to which it has been subjected are likely to check any enterprise in this direction for years to come. Its principal advantages of this kind are Washington Park, a city square which contains a statue of William Pitt, and Battery Park, a popular promenade which lies near the water's edge and commands an extensive view of the bay.

Savannah, on the contrary, is unusually well provided, having no fewer than 24 small parks or squares mostly of 1½ to 3 acres in extent, at the junction of their principal streets. The largest of these is Forsyth

Park of 30 acres, which contains a fountain modelled after that of the Place de la Concorde, Paris. In Monterey Square, on the spot where Pulaski fell in the revolutionary war, has been erected an elaborate monument, comprising a marble shaft 55 ft. high, on which stands an artistically designed and beautiful statue of Liberty. Monument Square possesses a Doric obelisk, erected to the memory of General Greene and Count Pulaski, the corner-stone of which was laid by Lafayette during his visit to this country in 1825.

Atlanta possesses Oglethorpe Park of 40 or 50 acres in extent, which formed the site of the International Cotton Exposition held in that city in 1881, one of the most important and attractive of American industrial exhibitions.

Salt Lake City, Utah, is well provided with park accommodation, it being divided into 21 wards, nearly every one of which has a public square. The park idea, indeed, has extended almost universally throughout the United States, and many even of our smallest cities are adopting plans for securing public pleasure-grounds while yet suitable localities can be had at reasonable prices.

In addition to its civic parks the United States now possesses several national parks, comprising extensive tracts of land, which, on account of their unique features of natural scenery, have been withdrawn from the public lands and set aside for the use of the people forever. Two of these are in California, one being the celebrated Yosemite Valley, which, for combined beauty and sublimity of scenery, has no equal upon this continent. (See YOSEMITE.) The other is the Mariposa grove of "Big Trees" (*Sequoia gigantea*), those giants of the vegetable world which have so excited the astonishment and admiration of travellers, and are among the most striking natural wonders of the Western Continent. This park is limited to an area of 4 sections of land or 4 square miles, its primary design being to preserve these marvels of nature from the destruction to which they were exposed by the heedless greed of the speculative tree-choppers who have already wrought such havoc in the American forests. In this remarkable grove there are said to be 365 trees of 10 ft. diameter and over, besides very many smaller ones. The highest tree is 272 ft., being 53 ft. lower than the highest of the Calaveras grove, but its trees exceed those of the latter in average bulk, the largest having still a circumference of 94 ft., after being much reduced by burning. The remains of a giant tree on the ground indicate a height of 400 and a diameter of 40 feet. A third national park, the most extensive of all known parks and the most extraordinary for its natural scenery, is the YELLOWSTONE NATIONAL PARK (q. v.). We need but say here that it embraces an area of 3579 square miles, within which it is said that there are more hot springs and geysers than in all the remainder of the earth.

To the above-named national parks has recently been added another, established with the same commendable purpose of preserving America's great features of natural scenery for the use of the public forever. This is the Niagara Park, set aside by order of the State of New York in conjunction with a similar commendable action of the Canadian authorities. The park on the American side is to be about a mile long and of varying width, from 100 ft. at the head of the upper rapids to 800 ft. at the falls. Everything obstructing the view of the rapids and falls is to be removed and the ground restored, as nearly as possible, to its natural condition, no artificial obstructions of any kind being permitted. The Canadian approach to the falls is to be treated in the same manner, and this noble phenomenon of nature will hereafter be free from the exactions and obstructions which have heretofore interfered with the enjoyment of its grandeur. (See NIAGARA.)

The Canadian government has recently followed the

example of that of the United States in setting aside a large tract of land possessing interesting natural features as a national park. This tract, on the line of the Canadian Pacific Railroad, is laid out on a generous scale, embracing 260 square miles of territory. The railroad reaches it at Banff, a station 20 miles within the Rocky Mountains and 40 miles from their summit. This district possesses hot sulphur springs of excellent curative properties, and an abundance of fine natural scenery, including mountains, rivers, etc. The springs have been improved and beautified, picturesque bath-houses and cottages built, and many miles of carriage road laid out and graded through the park. The rivers are spanned by bridges and bridle-paths have been made in all directions. The railroad company has built a commodious hotel at Banff for the convenience of tourists, but has no control over any other portion of the tract, which is held for the free use of the public.

It is of interest to note that not only governments, but private societies, are engaging in the desirable work of thus preserving striking monuments of art and nature. The Peabody Museum of Ethnology and Archaeology has recently, at the suggestion of Prof. F. W. Putnam, purchased and set aside as a public park the Great Serpent Mound of Adams co., O., with about 70 acres surrounding. This remarkable work, in the form of a huge serpent 700 ft. in length, winding in an undulating manner along the summit of a hill, and apparently swallowing an egg-shaped body represented by a mound 160 ft. long, is unique among archaeological remains, and the steps taken for its permanent preservation are highly commendable.

It is much to be desired that this system of preserving striking features of natural scenery by the establishment of national parks may be extended to all localities throughout the world which are possessed of remarkable scenic characteristics, or striking works of aboriginal art, and which are exposed to injury or to withdrawal from the use and enjoyment of the public. There are many such localities, unique in their features of interest, in various regions of the earth, which should be thus preserved, and it is to be hoped that the example set by the United States may be followed by the national guardians of all such localities. (C. M.)

PARLIAMENTARY PRACTICE. Blackstone observes that the word "parliament" was first applied to general assemblies of the states under Louis VII. in France about the middle of the twelfth century, but in that country it came eventually to be the designation of a body which performed certain administrative functions, but whose principal duties were those of a court of justice. From France the name was carried into England and applied to the great council of the English nation; but, as the word comes from the French *parler*, to talk, the title parliament has been extended to other deliberative assemblies which meet for the purpose of debating and deciding questions which may be submitted. In a general sense, therefore, a parliamentary body is one that meets for the purpose of discussing, deliberating, and deciding in an orderly and formal manner. Such a gathering may be termed a parliament, a congress, a convention, or it may be known by some other name.

Parliamentary law is the rule of action which should direct and control the proceedings of a parliamentary body. It is evident that some law or common understanding which shall bind and control the members in the transaction of business is needed in a deliberative body just as much as in the body politic. A state without a law, or without laws to which obedience is rendered, is in a condition of anarchy, and a deliberative assembly without binding laws would, likewise, be in an anarchical condition. Parliamentary law tends to prevent confusion and insures dignified despatch in the transaction of business. It is the result of long

experience and many tests in bodies most competent to comprehend what is necessary. It is based upon the principles of equity and is intended to guarantee justice to the entire body and to the individual, and, so, is specially valuable for its power to protect the minority and even of the humblest member.

The general principles of parliamentary law are to be gathered from the fixed rules and established usages of deliberative bodies of great dignity and authority. Hence the highest deliberative body in the land is usually recognized as the standard authority in parliamentary matters. Thus, in Great Britain the British parliament is so considered, and other bodies, whether secular or sacred, model their conduct upon the example set by the Houses of Parliament. Just as many of the laws in force in the United States run back to Britain, so the parliamentary law of this country is based upon the practice of the British Parliament; but, as the laws of the United States, though originally based upon those of England, have, through the course of years since the separation from the mother country, and because of our peculiar needs, become greatly modified, so, through different demands springing from changed circumstances, there have grown up practices in American parliamentary bodies which differ from the English, and, as these developments are peculiarly American, they give us what, in contradistinction from the British, may be termed American parliamentary law.

Variations in practice may be found in different bodies, even in the United States; but, notwithstanding these variations, there are certain general principles which are recognized everywhere throughout the land, and these general principles may be termed American common parliamentary law. These principles have been collated by certain recognized authorities on parliamentary law, and they are sometimes styled Parliamentary Practice, Rules of Order, or the Law and Practice of Legislative Assemblies. Thomas Jefferson, in his *Manual of Parliamentary Practice*, prepared when he presided over the Senate, did much to formulate the principles and spread the knowledge of American parliamentary law, and the rules of practice in his manual are to-day recognized by Congress "in all cases to which they are applicable, and in which they are not inconsistent with" other rules subsequently made. Many other writers have presented the later modifications in parliamentary practice.

Deliberative bodies, including the Congress of the United States, usually adopt rules for their own government, at least special rules which appear to be demanded by the peculiarities of their work or the peculiar purposes of their organization; but, where no such special rules exist, or when points arise to which their rules do not apply, the body is bound to obey general usage or, in other words, common parliamentary law. For the same reason, until an assembly adopts rules and orders, it is governed, and its proceedings are regulated, by the common parliamentary law. Even the national House of Representatives would come under this rule. Hence, where the general principles of parliamentary practice are well understood it may only be necessary to formulate a few specific rules to provide for peculiar circumstances. Sometimes the rules adopted vary from common parliamentary law which is broader even than congressional practice in some instances.

The organization of a parliamentary body implies a presiding officer who may be called a president, speaker, moderator, chairman, or who may be known by some other name, whose duty it is to see that the business is conducted in an orderly manner. It also implies a body of members who present, discuss, and decide the various propositions brought before the assembly.

Business is introduced under the form of motions or resolutions. In a parliamentary sense a motion is a formally worded proposition presented in a deliberative

body for its consideration and decision. The member offering it says: "I move," etc. The resolution is a more formally worded proposition and begins with the word "Resolved." The questions are decided by vote, and usually a majority vote determines the judgment of the house. In a few exceptional instances a different vote is required. The form of voting varies. Sometimes it is by voice, sometimes by show of hands, sometimes by counting the members as they stand, and sometimes by ballot.

In putting a question, the usual form is for the presiding officer to say: "The question is on the adoption of the motion (or resolution) which you have just heard. As many as are in favor of its adoption will say Aye." The ayes having voted, he will then say: "As many as are of a contrary opinion will say No," or "All opposed will say No." The chair, judging from a comparative estimate of the number of voices heard, will then announce the result, stating that the motion has been carried or lost, as the case may be. Where a hand-vote is customary, the hands are raised for or against in the same manner. The voice- and hand-votes are not precise but only approximate. The presiding officer is governed by the voices he hears or by the hands he sees; but, frequently, it is impossible for him to say positively how many voted on one side or the other, or even to say which side predominates. Where the chair is in doubt, he may ask the members to rise and stand until counted, and by this exact method determine the precise number voting on each side. This method, which is termed a *division of the house*, must be resorted to on the demand of any member, if the member expresses a doubt as to the accuracy of the judgment of the chair on a voice- or hand-vote. The proper procedure is for the member doubting to rise and say, "Mr. President, I call for a division of the house." Whereupon the chair will say, "A division is called for. Those in favor of the motion (or resolution) will rise and stand until counted." In a similar way he will take the opposite. By such a division the exact vote on each side will be ascertained, and the chair will announce his decision accordingly, even if it reverses his former opinion.

In taking a division the members, as they stand in their places, are sometimes counted by the presiding officer and sometimes by the secretary or clerk. More than one person should count in order to ensure accuracy.

Another form of dividing is that of passing in file between *tellers*. In this method the speaker appoints two tellers, one from each side of the question. These tellers take positions in the space in front of the presiding officer, and the members pass in single file between them, those on the affirmative side passing first and then those on the negative.

Another method of voting is that of taking the *yeas and nays*, so that each member shall answer when his name is called, and have his vote recorded. In Congress the vote must be so taken when the call is sustained by one-fifth of those present.

Sometimes voting is by ballot. This method is resorted to when the rule of the body requires it, and is quite common in the election of officers, in the admission of members into societies, and also when secrecy is desired. Sometimes white balls and black balls are used; at other times slips of paper are employed.

If the speaker is a member of the body he has a right to vote, but he does not ordinarily do so unless his vote would be decisive. The rule of the U. S. House of Representatives is that the Speaker "shall not be required to vote in ordinary legislative proceedings, except where his vote would be decisive, or where the House is engaged in voting by ballot."

Motions generally are debatable; a few are not. Most motions require only a majority vote, but a few require a larger vote.

After a motion has been made other motions bearing

upon the original motion may be presented. Then the original motion is called the main question, and the motions bearing upon it are called subsidiary or secondary motions.

The most common of all these subsidiary motions is the motion to amend, the object of which is to amend or improve the primary motion. The amendment must be germane to the subject-matter of the main question. A motion may be made to amend the amendment. This is sometimes called an amendment in the second degree. The vote is first on the amendment to the amendment, then on the amendment as amended or not, and finally on the original motion as amended or not amended.

A substitute is of the nature of an amendment, but its scope is broader. No amendment is permitted at one time beyond an amendment to an amendment, but late practice makes it possible, while an amendment to an amendment is pending, to offer a substitute and an amendment to the substitute. Thus the *Digest of the House of Representatives of the United States* says: "It has been for many years the practice of the House that there might be pending, at the same time with such amendment to the amendment, an amendment in the nature of a substitute for part or the whole of the original text, and an amendment to that amendment. . . . So that, notwithstanding the pendency of a motion to amend an amendment to the original matter, a motion to amend, in the nature of a substitute, and a motion to amend that amendment, were received, but could not be voted on until the original matter was perfected."

The motion to *postpone to a certain day* or to a certain time is intended to postpone the question to the time specified. If carried, the question cannot be taken up before that time except by a two-thirds vote, but when the time is reached the subject is entitled to be taken up in preference to everything except privileged questions.

The motion to *postpone indefinitely* is intended to suppress a question, and, if carried, it removes the question from consideration for that session.

The motion to *refer* or *commit* is intended to take the question from the main body and transfer it to the consideration of a committee. The motion to *recommit* is the same as to refer, only that it relates to matter already reported by the committee. All the above-mentioned motions are debatable. In some legislative bodies the motion to refer is not debatable, but, according to common parliamentary law, it opens the merits of the main question to debate.

The motion to *lay on the table* possesses the character of postponement, but it keeps the subject directly within the reach of the body. It is intended to remove the question from consideration until the house votes to take it up. This can be done at any time by a majority vote. If such a vote cannot be obtained the measure is effectually suppressed, but the motion in itself is not a finality but merely a temporary disposition of the question. Because of this the motion is not debatable. As a general thing the motion tables everything that adheres to the motion upon which it bears. Thus if an amendment is laid on the table it carries with it the main question. There are, however, a few exceptions, thus: as a question of privilege does not adhere to the subject it interrupts, it does not carry with it to the table the question pending when it was raised; an appeal laid on the table does not carry with it the original question; a motion to reconsider, when laid on the table, leaves the original question where it was before the motion to reconsider was made; and, an amendment to the minutes, being laid on the table, does not carry the minutes with it.

The *previous question* in American practice is very different from what it is in the English. In American usage it is simply a method for cutting off debate, and is equivalent to the question, Shall the discussion now cease? It is itself undebatable, and if it is carried it

brings to an end the debate on the main question. A member says, "I move the previous question," but, when the chairman puts the question, he says, "Shall the main question be now put?" The previous question may be limited to a pending amendment or it may cover both amendment and main question. In common parliamentary practice the previous question requires a two-thirds vote, but in some legislative bodies a majority vote is sufficient. It ought, however, to require a two-thirds vote, because it cuts off the natural right of a member to discuss a question, and that should not, at least in ordinary bodies, be in the power of a bare majority.

Another class of motions is called *incidental questions*. These are so called because they are occasioned in a casual way during the consideration of principal, subsidiary, or other questions, and, from their very nature, they must be decided before the questions which gave rise to them. They cannot be amended, and, excepting the case of an appeal, they cannot be debated, and even an appeal is not always debatable.

The incidental questions are: (1) Questions of order (including an appeal from the decision of the chair); (2) objections to the consideration of a question; (3) reading of papers; (4) withdrawal of a motion; (5) suspension of the rules.

If a member notices anything in the procedure which he thinks is a violation of good parliamentary usage or of the rules of the body, he may arise, and, addressing the chair, say: "I rise to a point of order." The chairman then interrupts the proceedings, and says: "The member will state his point of order." After the member has stated the point, the presiding officer decides that the point is (or is not) well taken. If any member is not satisfied with the correctness of the decision he may take an appeal to the meeting itself. The question then is, "Shall the decision of the chair stand as the judgment of the assembly?" Ordinarily an appeal is debatable. It is not debatable, however, if the previous question was pending at the time the point of order was raised. When the appeal is debatable, the previous question and the motion to lie on the table may be applied to it, but, if adopted, they affect nothing but the appeal. To sustain the chair does not require more than a majority vote, but even a tie vote sustains his decision, on the principle that the decision can be reversed only by a majority.

According to present practice any motion may be withdrawn by the mover before a decision or amendment, but not after the previous question has been ordered. To suspend the rules of a body requires a two-thirds vote.

Privileged questions constitute another class of motions. They are called privileged questions on account of special privileges which they possess because of their pressing importance. They may be introduced almost at any time, and, when properly introduced, must be considered before any other subject or proposition that may be before the house.

The privileged questions are: (1) To fix the time to which the body shall adjourn; (2) to adjourn; (3) question of privilege; (4) a call for the orders of the day.

It is sometimes said that a motion to adjourn is always in order, but this is not strictly correct. There are times when it is not in order. Thus, if the motion to adjourn is lost, it cannot be repeated until there has been some intervening business, or at least some progress in debate. Neither can a motion to adjourn be made while a member has the floor; yet the member may, if he pleases, give way, in order that the motion may be presented. A motion to adjourn cannot be received while the yeas and nays are being called, or the members are voting on any question, or when the previous question has been called and sustained and is still pending. The unqualified motion to adjourn cannot be debated, and cannot have any amendment or any other subsidiary motion applied to it, and

the vote on it cannot be reconsidered. It supersedes all other motions except the motion to fix the time to which to adjourn. The latter motion does not adjourn the meeting, but is intended to fix the time to which the adjournment will stand when the meeting does adjourn. This motion takes precedence of all other questions, and may be made after the meeting has voted to adjourn if the presiding officer has not announced the result of the vote. It may be amended by altering the time.

The general rule as to the rank of questions is that of the U. S. House of Representatives, which is as follows: "When a question is under debate no motion shall be received but to fix the day to which the House shall adjourn, to adjourn, to take a recess, to lay on the table, for the previous question, . . . to postpone to a certain day, to refer or amend, or to postpone indefinitely, which several motions shall have precedence in the foregoing order."

The motion to *reconsider* is intended to bring back before the house a question that has been decided, and to place it before the house just as it stood before the vote was taken upon it, but as the rule of the U. S. House of Representatives puts it, "The fact of a question having been decided under the operation of the previous question does not prevent debate on the motion to reconsider if the original question was otherwise debatable." The motion to reconsider may be applied to votes on all questions excepting on motions to adjourn, to suspend the rules, affirmative votes on motions to lie on the table or take from the table, on matters which have passed from the possession of the house, and on the previous question when it has been partly executed. It may be made when other business is before the house. In such a case the motion is entered upon the minutes, the business before the house proceeds, and the motion to reconsider is held over to be called up at any time before the close of the session.

The general rule is that the presiding officer must recognize the member who is first up and first addresses the chair, but there are a few exceptions. Thus, the member upon whose motion the subject has been brought before the body, if he has not spoken to the question, has the prior claim. No member can be deprived of his rights by the chair as long as he is in order, and it is not within the province of the presiding officer to cut off debate. Even after a vote has been taken and the result declared, if it appears that a member did rise and address the chair, but was not recognized, then his right to speak must be admitted, and the question will stand as though no vote had been taken.

In Congress and in the State Legislatures bills are read three times. Where the Legislature is a double body, consisting, for example, of a Senate and a House of Representatives, a bill after passing one body is sent to the other. If both bodies agree to its passage, then it is sent to the president or chief-executive for his signature. If the second body makes amendments in the bill, then, when it is returned, the house where it originated considers the amendments. If there is not agreement between the two houses, each house selects a committee of conference, and this committee endeavors to agree upon amendments which will meet the approval of both bodies. If the chief-executive vetoes the bill it is returned to the house where it originated; then, if it receives a two-thirds vote of each house, the bill becomes a law without the approval of the executive.

Parliamentary law has become a vast study. *The Law and Practice of Legislative Assemblies*, by L. S. Cushing (Boston), is a large octavo of 1063 pages. Besides this standard work, the following may be consulted: *Jefferson's Manual; Digest of Rules and Practice of the U. S. House of Representatives*; O. M. Wilson's *Digest of Parliamentary Law*; Warrington's *Manual*; Cushing's *Manual*; Roberts' *Rules of Order* (Chicago); G. T. Fish's *Parliamentary Law*; Rufus Waples' *Hand-Book on Parliamentary Practice*; T. B. Neely's *Parliamentary Practice*. (T. B. N.)

PARNELL, CHARLES STEWART, the Irish agitator, is descended from an English Protestant family originally settled in Cheshire. His paternal grandfather, Sir Henry Parnell, was a member of Parliament, and in 1841 was raised to the peerage as Lord Congleton. His maternal grandfather was Rear-Admiral Charles Stewart (1778-1869) of the U. S. Navy, familiarly known as "Old Ironsides." Parnell was born in June, 1846, at Avondale, County Wicklow, Ireland. He was educated in English schools and at Cambridge University, where he remained two years. After travelling through the United States he settled down on his estate in Ireland, and in 1874 was made sheriff of Wicklow county. In the next year he was elected to Parliament from Meath as a Home-Ruler. Isaac Butt (q. v.) was then the leader of this party, but Parnell and Biggar soon introduced a policy of obstruction which he did not favor. Their object was to compel the Parliament to redress the grievances of Ireland under a penalty of having all the parliamentary work greatly delayed or entirely stopped. By persistent speaking on every subject that afforded an opportunity they wearied out the patience of the English members and at last obliged them to take some action on Irish questions. The Home Rule party had sought for a reform in the Irish land laws which was summed up in the three F's—Fixity of Tenure, Fair Rent, and Free Sale. In 1879 the potato crop in Ireland failed for the third time in as many successive years. Evictions of tenants from their little holdings of land followed in great numbers. Parnell, now recognized as the leader of the Irish party in Parliament, was induced by Michael Davitt to give his assent to the formation of the National Land League, which aimed at peasant-proprietorship. In October the league was organized, Parnell was chosen president, and branches formed in all parts of Ireland. In 1880 the Liberal party under Mr. Gladstone returned to power with overwhelming majority. The case of Ireland had not been considered in the election campaign, and the Parnellites, now thirty-five in number, resolved to remain in opposition in Parliament and continue the policy of obstruction. Mr. W. E. Forster, the Secretary for Ireland, soon brought in Coercion Bills which justified Parnell's forecast of the situation. Under the pretence of the increase of outrages in Ireland they suspended the *Habeas Corpus* and required the disarming of the Irish people. Then Mr. Gladstone introduced his Land Bill, which went far towards meeting the original demands of the league. Yet Parnell and his adherents resolved to maintain the organization until it was sure that the action of the courts under the new act would be equitable and satisfactory. The government, on the other hand, guided by Mr. Forster, determined to crush all opposition, and in October, 1881, arrested Parnell and others under the Coercion Act and imprisoned them in Kilmainham Jail, Dublin. The league was outlawed, but it replied with a "No Rent" manifesto. The ensuing struggle proved too severe for the administration. Mr. Forster was dismissed and Parnell was released on parole in April and unconditionally in May, 1882. He returned to Parliament in triumph, but the victory of the Irish cause was overthrown by the assassination in Dublin of the new Chief Secretary, Lord Frederick Cavendish, and of Edmund Burke, the under secretary. A Crimes Act was speedily passed and Home Rule sank out of sight. The policy of obstruction had been neutralized by the *clôture* acts which increased the power of the Speaker of the House of Commons over the members. However, the electorate of Ireland was soon increased from 250,000 to 750,000, and a Redistribution Bill promoted a fairer representation of the people in Parliament. But the strength of the Liberal party steadily declined, and in June, 1885, it was overthrown. In the November elections the Tories had the aid of Irish votes, but when they refused guarantees of their action in Parliament, they

were defeated on Jan. 26, 1886, and Mr. Gladstone again became prime minister. Parnell's party had secured nearly every seat for Ireland. Their demand now was for complete legislative independence and an Irish Parliament. Gladstone, convinced of the justice of the demand, soon introduced a bill for the purpose. But though it had many elements of strength, the result was to disrupt his party and drive him again from power. In the new election thus precipitated on the country the Tory party obtained enough help from the Liberal dissidents to enable it to undertake the task of governing the country. In the Parliament of 1887 Parnell's motions were defeated by large majorities, but he continued steadfast in his purpose of seeking a national parliament for Ireland.

Later a sensation was produced by the publication in the *Times* of the facsimile of a letter purporting to have been written by Parnell excusing the murder of Mr. Burke, though expressing regret for that of Lord Frederick Cavendish. Parnell repudiated the letter, but the government refused to investigate the matter. The *Times* then published a pamphlet, entitled *Parnellism and Crime*, charging Parnell and his associates with being accessories in various outrages. A suit was brought against the *Times* by one O'Donnell for libel, but was decided in favor of the defendant. This suit the Parnellites declared to be collusive. Finally in October, 1888, the charges of the *Times* against Parnell and others vaguely described were investigated before a commission of three judges. The prosecution was conducted by Sir Richard Webster, the attorney-general. The proceedings so far as they have gone (November) seem to support the view commonly held that the alleged letter which formed the basis of the indictment was a forgery.

Parnell is not a typical Irishman, according to the types presented in English literature. He is not an orator; he shrinks from public display. He is handsome in feature, quiet in manner, pleasant in his intercourse with others, perhaps slightly ideal in his aims, but thoroughly practical in the means he adopts for accomplishing them. His remarkable power over his followers is due to his absolute sincerity of purpose, the excellence of his judgment on all important questions, and the tenacity with which he maintains his conclusions. In the presence of the world he has brought an impulsive, discordant people into harmonious and almost unanimous effort for the highest privilege of a nation—the right of self-government.

(J. P. L.)

PARROTT, ROBERT PARKER (1804-1877), an American inventor, was born at Lee, N. H., Oct. 5, 1804. He graduated at West Point in 1824 and was made second lieutenant of artillery. He was assistant professor at West Point for some years, and in 1836 he became superintendent of the West Point iron and cannon foundry, Cold Spring, N. Y. He invented a system of rifled cannon which bears his name. (See *ORDNANCE*.) He died at Cold Spring, Dec. 12, 1877.

PARSLEY, *Petroselinum sativum*, a hardy biennial herbaceous plant from Sardinia, has an angular stem three to four feet in height, shining, tripinnate leaves of a rich deep green, and small, white flowers in terminal umbels, with five petals and aborted sepals. The fruit is ovate, with five narrow equal ridges, and seeds with an aromatic taste. Parsley is grown from the seed, sown annually in early spring, and is often raised under glass. It requires a rich, mellow soil. It is principally cultivated for the use of its leaves as an ornamental garnish to meats, for which purpose the double, or curly-leaved, variety is grown. By repeated transplanting during the season the curling of the leaves is aided, till they become of a regular rosette form. The leaves are also used for flavoring soups and stews, for which purpose the seeds are sometimes substituted. One variety, known as the Hamburg, is raised for its root, which is large, white, and fleshy, and resembles the parsnip. It is eaten boiled, and is

also used, mixed with the leaves, to flavor soups, to which it imparts a pleasant aromatic taste and odor.

PARSNIP. See *AGRICULTURE*, Chap. V., 2.

PARSONS, SAMUEL HOLDEN (1737-1789), general in the Revolution, was born at Lynn, Conn., May 14, 1737. He was the son of Rev. Jonathan Parsons (1705-1776), a noted preacher. He graduated at Harvard College in 1756 and became a lawyer. He was frequently elected to the Legislature and, though made king's attorney in 1774, took part with the patriots. He commanded the Sixth Connecticut regiment at the siege of Boston in 1775 and fought in the battle of Long Island. Congress made him brigadier-general in August, 1776, and in October, 1780, he became major-general. He succeeded Putnam in command of the Connecticut line. In recent years he has been charged with holding secret communication with Sir Henry Clinton and furnishing him with information of the state of the American army. In 1785 he was appointed a commissioner to treat with the Miami Indians. After serving in the Connecticut Convention which ratified the Federal Constitution, he was appointed by Washington first judge of the Northwest Territory. He settled in Ohio and took part in the purchase of the Western Reserve. He was drowned in Big Beaver River, Ohio, Nov. 17, 1789. He contributed to the *Transactions of the American Academy* a paper on Western antiquities.

PARSONS, THEOPHILUS (1750-1813), jurist, was born Feb. 24, 1750, at Byfield, Mass., where his father was pastor of the Congregational church for more than forty years. He graduated at Harvard College in 1769 and was admitted to the bar at Portland, Me., in 1774, but soon returned to Byfield, and afterwards settled at Newburyport. In 1778 he formed one of the Essex Junto, and wrote the *Essex Result*, a pamphlet which caused the rejection of a State constitution prepared by the Legislature. It had effect also on the framing of constitutions in other States. The author took part in the convention which framed the State constitution of 1780, and in the convention which ratified the Federal Constitution in 1788. In 1800 he removed to Boston and in 1806 was made chief-justice of Massachusetts. His decisions served to place on a firm basis the laws of real property and marine insurance. He died at Boston, Oct. 30, 1813. His son published his *Memoir* (1859). From his writings were collected *Commentaries on the Laws of the United States* (1836).

His son, **THEOPHILUS PARSONS** (1797-1882), was also distinguished as a jurist and as an advocate of Swedenborgianism. He was born at Newburyport, May 17, 1797, graduated at Harvard in 1815, studied law and practised at Taunton, but chiefly in Boston. In 1847 he was made Dane professor of law in Harvard College. He died at Cambridge, Jan. 26, 1882. Among his legal treatises are *The Law of Conscience* (2 vols., 1853; afterwards enlarged to 3 vols., 1864); *Elements of Mercantile Law* (1856); *Laws of Business for Business Men* (1857); *Maritime Law* (1859); *Notes and Bills of Exchange* (1862); *Law of Partnership* (1867); *Marine Insurance* (1868); *Shipping and Admiralty* (1869). Some of these works have passed through several editions. Prof. Parsons' writings in defence and exposition of the teachings of Emanuel Swedenborg include *Deus Homo* (1867); *The Infinite and the Finite* (1872); and some smaller treatises.

PARTNERSHIP is a relation founded upon a contract between two or more persons to do business as individuals on joint, undivided account. Every unincorporated association for purposes of gain is a partnership. The question whether a partnership exists or not has been said to be one of mixed law and fact, but generally speaking is one to be decided by a jury. The elements of partnership are the contribution by a partner to the partnership fund and a sharing in the profits. Each is an element in a relation not complete without both.

See Vol. XVIII.
p. 329 (p. 334
Am. Rep.).

A quasi-partnership, *i. e.*, a partnership as to third persons, may result from sharing profits and not losses. Partnership is a question of intention, and the intention to contribute to the partnership and to share the profits will, if apparent, create the relation, even against the express stipulation of the parties. While the sharing of profits raises a presumption of partnership, yet it may appear that the share so taken was nothing more than a compensation for labor or service, for furnishing raw materials, etc. It has been held that the officers and crews of whaling-vessels receiving part of the produce of the voyage in lieu of wages are not partners; nor masters of vessels sailing them on shares; nor clerks receiving share of profits in lieu of wages, there being no contribution.

While there have been many, and in some instances conflicting, decisions on this question of what constitutes a person a partner, the underlying principle is, that if there is an evident intention to derive the advantages of the partnership relation, the liability attendant thereupon will also be enforced. There is no particular formality requisite to the formation of a partnership. Where there is no written agreement, it may be proved by evidence of the conduct of the parties, the mode in which they have dealt with each other, and in which each has, with the knowledge of the other, dealt with other persons. This may be shown by the books of account, by the testimony of clerks, agents, and other persons, by letters, and admissions, etc.

A general partnership is the relation as it ordinarily exists. A special or limited partnership is composed of general partners, to whom all the ordinary rules of partnership apply, and of limited partners with circumscribed power and liability limited to the amount of their contribution. This kind of partnership is statutory, and the requirements of the statute as to advertisement, placing the list of partners in a conspicuous position at the place of business, indicating which are general and which special, must be strictly complied with. The penalty for non-compliance therewith is to have the association declared a general partnership.

A "partnership limited," also statutory, is in the nature of a corporation, no liability being incurred by the members beyond the amount of their subscription, the penalty for a violation of the requirements of the statute being the same as in the case of a special partnership. Joint-stock companies form another class of partnerships. They consist of a large number of persons, whose liability as a general rule is that of a general partner, though in some instances the liability is limited by the provisions of the statute.

A quasi-partnership may be created by a man holding himself out as a partner, without having any connection with the business or interest therein; in such case he is estopped to deny his liability as a partner. Holding oneself out as a partner is a question of fact. It may be by direct assertion, or by authority given to a partner to use the stranger's name. It may also occur by reason of failure on the part of a stranger to forbid the use of his name; it is usually proved by evidence that the stranger suffered the use of his name over the shop-door, in printed notices, bills, advertisements, etc., or that he has done other acts, of whatever kind, sufficient to induce others to believe him a partner. It is essential, however, that the holding out should have been prior to the contract with the third person, as well as the inducement to it.

Partnership was formerly confined to commercial transactions; its scope has been gradually enlarged, however, until it includes associations for all sorts of purposes, *e. g.*, of attorneys-at-law, physicians, etc. At the common law partnerships for trading in land were not recognized, but at the present time, and especially in America, land is largely held by speculators, who are recognized as partners by the law; so with building operations. Farming land on shares, however, has been held to be no partnership.

The partners are presumed to have the same interest

in the stock that they have in the profits. There is sometimes no joint stock, as where the partnership is merely for the managing and disposing of the goods of others. A partner may contribute but the use of his capital, retaining full control of the principal; and he may charge interest for its use, whether profits are earned or not. The partnership property has been said to consist of the original stock, together with the additions made to it in the course of trade. Real estate bought with partnership funds is treated as partnership property, whether the legal title thereto is in all the partners or only in one. Leases of real estate by one partner for firm purposes, mines, and trademarks have been held to be partnership property.

A partner cannot convey land belonging to the firm; his grantee in such case would take title subject to the rights of the copartner to have the firm property applied to the partnership debts. It has been held in some cases that there was an equitable conversion of land belonging to a partnership, and that it should be treated in every respect as personality.

In administering bankrupt partnership estates the firm and separate creditors have priority upon and are confined to the firm and separate funds respectively. A surplus upon a separate fund is divided among the firm creditors *pro rata*; a surplus upon a firm fund is divided among the separate creditors of the various partners in proportion to the shares of the partners therein. If there is no firm fund the firm creditors come in on an equal footing with the separate creditors against the separate estate. If, however, there is no separate estate, separate creditors cannot participate in the firm estate, upon the theory of the partner's right to have firm funds applied first to the payment of firm debts. It has been held that insolvent partners may divide the firm fund, in proportion to each one's interest in the firm, among their separate creditors, and the firm creditors cannot object; *contra*, however, if the fund were assigned to the separate creditor of one partner only.

A separate judgment is not a lien against the partnership real estate but only against the partner's interest. A judgment against the firm, however, is a lien on a partner's separate estate, and takes priority over a subsequent separate judgment.

While a partnership is presumed to be at will, it may be entered into for a definite term by agreement, express or implied. If a partnership be continued by express or tacit consent after the expiration of the prescribed period it will be presumed to continue on the same terms, but as a partnership at will. A partnership for a specified term is, nevertheless, dissolved by a death within the term. While executors and testamentary trustees may be admitted, either under an original agreement or by testamentary direction, to a partnership, yet it has generally been held that such clauses gave them the option to become partners, and did not constitute them such absolutely. Only the fund already invested or directed to be invested by the testator is subject to the claims of new creditors, unless there be a clear direction to charge the general assets. In England, if an executor undertakes to participate in the business, whether in carrying out a testamentary direction or not, he becomes personally liable as a partner, in addition to the liability of the estate. In several of the United States, *inter alia*, Alabama, Maryland, and Pennsylvania, however, the executor has been held liable only when continuing in the business of his own motion, and not when doing so in carrying out a testamentary direction.

Dissolution of Partnership.—A partnership may be dissolved (1) *by the act of the parties*, as by their mutual consent. Where no limit is fixed for its continuance either party may dissolve it at any time. There are authorities on both sides of the question whether one partner can dissolve a partnership for a certain term previous to its expiration; (2) *by the act of God*, as by the death of one of the partners, unless there be an

express stipulation to the contrary. In such case the partnership is dissolved as to the whole firm; (3) *by the act of law*, as by the bankruptcy of one of the partners; (4) *by a valid assignment* of the partnership effects for benefit of creditors. The mere insolvency of one or all partners without suspension or judicial process does not of itself operate as a dissolution; (5) *by the civil death* of one of the partners; (6) *by the breaking out of war* between two states in which the partners are severally domiciled and carrying on trade; (7) *by the marriage of a feme sole partner*; (8) *by the extinction of the subject-matter* of the joint business, or by the completion of the business for which the partnership was formed; (9) *by the termination* of the period for which the partnership was formed; (10) *by the assignment* of the whole of one partner's interest either to his copartner or to a stranger; (11) *by the award of arbitrators* appointed under a clause in the partnership articles.

A dissolution of a partnership for a term will be decreed by reason of fraud or gross misconduct of a partner, or gross carelessness and waste on his part in administering its affairs, or violent and lasting dissensions among the partners, or the hopeless condition of the business, its continuance being impracticable, and the property liable to be wasted and lost. Clear evidence of a partner's lunacy will also induce a court to decree a dissolution.

Actual notice of dissolution must be brought home to persons who have been in the habit of dealing with the firm; but as to persons who have had no previous dealings with the firm notice in the newspapers is sufficient. This notice is necessary to terminate the agency of each partner, and his powers and liabilities as such. When the dissolution takes place by operation of law, or by the death of a partner, notice is not necessary.

The effect of dissolution is to terminate all transactions between the partners except for winding up the concern, and to absolve the partners from all liability for future transactions of the firm. The power of the partners subsists, however, for some purposes, as for the completion of all unfinished engagements of the partnership; the conversion of the assets for the benefit of the partners; the application of the partnership funds to the payment of the partnership debts.

(T. R.)

PARTON, JAMES, a popular author, was born at Canterbury, England, Feb. 9, 1822, but was brought to the United States when five years old. He was educated in the vicinity of New York, and after being a teacher for seven years became a contributor to the New York papers. His first work, *The Life of Horace Greeley* (1855), contained fulness of research with an enthusiastic picturesque narrative. It has been enlarged in subsequent editions and long remained popular. After completing *The Humorous Poetry of the English Language* (1857) he prepared *The Life of Aaron Burr* (1859), which possessed much of the merit of his first work, but was too partial to its subject. In the appendix to a later edition (1865) many statements of the first are recalled. Parton had in the meantime published a bulky *Life of Andrew Jackson* (1860), which showed equal diligence in hunting information from obscure sources and great skill in its presentation. His next biography was that of Benjamin Franklin (1864), which gave him room for his love of anecdote and sketching of character. His story of *Gen. Butler in New Orleans* (1863) skilfully presented the facts of the restoration of Union rule to a city in which the spirit of the Southern Confederacy was dominant. After the war Parton took up various social topics which he discussed in magazines and reviews in an entertaining and popular style. To this series belong *Smoking and Drinking*, *How New York City is Governed*, *the Work of Congress*, *Roman Catholics and Jews*. In *The Triumphs of Enterprise, Ingenuity and Public Spirit* (1871) he presented the story of the most remarkable

inventions of modern times. Another skilful compilation is *Caricatures in all Times and Lands* (1876). Parton's best work, however, is in his biographies. *Famous Americans of Recent Times* (1867) is a collection of brief sketches, but his *Life of Jefferson* (1876) and *Life of Voltaire* (1883) are elaborate works with his characteristic excellencies. Parton is a man of the people with the gift of story-telling. He cares little for poetic genius, statecraft, or religion, and misses no opportunity of deriding those whose station is due to other causes than personal merit.

His wife, SARA PAYSON PARTON (1811-1872), was the sister of Nathaniel P. Willis. She was twice married, but, being reduced from affluence to poverty, tried to support herself and two children by teaching and afterwards by writing for the newspapers. Under the pseudonym "Fanny Fern" she gained a remarkable popularity. Of her *Fern Leaves* (1853) several series were issued. She also published two novels, *Ruth Hall* (1857) and *Rose Clark* (1859). She was married to Mr. Parton in 1856 and after her death he published *Fanny Fern, a Memorial Volume* (1873).

PARTRIDGE is a term used scarcely less loosely by ornithologists than by others, and its meaning depends upon circumstances. See Vol. XVIII. p. 332 (p. 337 Am. Rep.). Its newest technical equivalent is *Perdixina*, by which is meant a subfamily of the grouse family, *Tetraonidae*, containing several genera and many species of gallinaceous game-birds of most parts of the world (especially the northern hemisphere), which average less in size than grouse and have the nasal fossæ and the feet bare of feathers. Many of these birds have a characteristic note which the word "partridge" in its several forms seems to have been invented or designed to express.

In Britain the only indigenous partridge is that sometimes designated as the gray partridge (*Perdix cinerea*) to distinguish it from another bird, *Caccabis rufa*, which has been introduced and naturalized there. (For these as well as some other old-world species of the above-named genera and others, see the article in the *ENCYCLOPEDIA BRITANNICA*.)

In English-speaking parts of the old world the partridges of whatever kind are commonly distinguished both from the grouse and from the quail, of both of which there are various species and genera. But in the United States the case is the reverse, for some grouse are indifferently called "pheasant" and "partridge," and various birds are indifferently called "partridge" and "quail." It is an example of that confusion which arises in nomenclature when the names of animals and plants of one country are loosely applied to other more or less similar animals of another country.

For, it must be distinctly understood that no gallinaceous bird whatever, excepting certain ptarmigan of the Arctic regions, is common to Europe and America. Attempts have been made to introduce the European or migratory quail, *Coturnix dactylisonans*, but they have hitherto failed.

In the Eastern United States two very different birds are called "partridge." One of these is the ruffed grouse, *Bonasa umbellus*. The other is the bob-white, *Ortyx* or *Colinus virginianus*. (See *BON-WHITE*.) Throughout the Northern States, where this grouse is called partridge, the bob-white is known as the "quail." In the Middle and Southern States, or from Pennsylvania southward, this grouse is called pheasant, by an absurd misnomer; and wherever this name prevails, there the bob-white is called "partridge." Thus we have three popular names for the two birds, whose application changes with the locality. These two are the only gallinaceous game-birds that are common and widely distributed in eastern parts of the United States. In the West there are several others, as the pinnated grouse or prairie-hen, *Cupidonia cupido*; the sharp-tailed grouse, *Pediceetes colum-*

bimius; the sage grouse or cock of the plains, *Centrocercus urophasianus*; the dusky grouse, *Canace obscurus*, etc. The last-named is a near relative of the Canada grouse, *Canace canadensis*, which is often called the "spruce partridge," making yet another bird to share this latter name.

Then, in south-western parts of the United States and in Mexico and southward are several different genera and species of birds about as large as the bob-white, all called indifferently "partridge" or "quail." Such are the mountain quail of California, *Oreortyx pictus*, with a long arrowy crest; the valley quail of California, *Lophortyx californica*, with

California Valley Quail.

an elegant recurved helmet-like crest; the very similar Arizona partridge or quail, *Lophortyx gambeli*; the blue or scaled partridge or quail, *Callipepla squamata*; and the very handsome Massena partridge or quail, *Cyrtonyx massena*. Moreover, the common Virginia partridge, quail, bob-white, or colin runs into several varieties in Florida and in Texas; and a distinct species of the same restricted genus *Colinus*, *C. ridgwayi*, has been lately ascertained to inhabit Arizona. Mexico and Central and South America also furnish yet other species of *Colinus*, *Dendrortyx*, *Odontophorus*, etc., all of which birds may be indifferently called quails or partridges.

All these small gallinaceous game-birds of America with naked and scaly tarsi (as distinguished from the feathered shanks of grouse and ptarmigan) are sometimes grouped together as a subfamily, *Odontophorinae* or *Ortyginae*, which has no representatives outside of America. (E. C.)

PASSAGLIA, CARLO (1812-1887), Italian theologian, was born at San Paolo, near Lucca, May 12, 1812. He was educated at Rome and became a Jesuit in 1827. He taught in the Roman College until 1858, when he left the Jesuit order and was made professor in the College of Sapienza. He was active in the movement which led to the proclamation of the dogma of the Immaculate Conception of the Virgin Mary.

He afterwards addressed a letter to the bishops of Italy on the claims of Italian unity and urged the pope to renounce his temporal power. But his pamphlet was placed on the Index, and the author was obliged to flee from Rome in disguise. He had just published anonymously two other pamphlets, one on the duty of the pope to reside in Rome, the other on the limits of excommunications. He was made professor of moral philosophy in the University of Turin and soon issued another pamphlet on schism. He formed an association of the liberal clergy of Italy and was elected to the national parliament in 1863. His political career was short, and finally in 1882 he submitted to the Holy See and was restored to his priestly functions. He died at Turin, March 17, 1887.

PASSAIC CITY, in Passaic co., N. J., is at the head of tide-water on the Passaic River, 11 miles N. W. of New York city, on the Erie, the Delaware, Lackawanna, and Western, and the New York, Susquehanna, and Western Railroads. It is well laid out with macadamized streets, has 14 churches, 5 schools, 2 daily and 2 weekly newspapers, several halls, is lighted with gas and well supplied with water. It has two iron-foundries, and manufactures of woollen goods, chemicals, India-rubber, whips, and other goods. Many of the inhabitants conduct business in New York city. The population was 6532 in 1880, and has since increased.

PASSOVER. See **TABERNACLE**.

PASTEUR, LOUIS, a French chemist, was born at Dôle, Dec. 27, 1822. He had spent some years in teaching physical science at Besançon and at Paris before he received the doctor's degree from the Normal School in 1847. He was then made professor of chemistry at Dijon, and a few months later at Strasbourg. In 1854 he was appointed to organize the new faculty of science at Lille, and in 1857 he returned to Paris to take charge of the scientific instruction in the Normal School. Here he remained ten years, being also from 1863 professor of geology, physics, and chemistry in the school of the Fine Arts. From 1867 to 1875 he was professor of chemistry at the Sorbonne, and there retired on a pension, his sight and health having been seriously impaired by his arduous labors. His chemical investigations and their practical results had already given him world-wide fame. In 1856 he received from the Royal Society of London the Rumford medal for his researches on the polarization of light, and in 1874 the Copley medal. From the outset of his career he has been an ardent opponent of the theory of spontaneous generation, which was advocated by many scientists. He maintains that fermentation is always due to microscopic plants or animalcules, and that it can be prevented by carefully excluding their germs from access to the fermentable substance. His conclusions have had important consequences on the manufacture of wine and beer. Their scientific and commercial value was recognized by the French and other governments, which awarded him prizes and pensions. His investigations of the diseases of the silk-worm were also extremely valuable to the silk industry of France. He traced the disease to certain minute internal corpuscles and pointed out the method of prevention. (See **GERM THEORY**). For some years he had directed his investigations towards the discovery of a specific germ for each disease of man or the lower animals. Other investigators had also joined in the researches and the discovery of several such germs has been reported in recent years. None has produced such sensation, however, as Pasteur's claim to have found not only the true nature of hydrophobia but also the method of preventing it by inoculation. (See **HYDROPHOBIA** and **BACTERIA**.) Pasteur's researches have been reported in the *Annales de Chimie et de Physique* and other publications. He has also published treatises on wine (1866), vinegar (1868), silk-worms (1870), beer (1876), microbes (1878).

PASTORAL EPISTLES is the name applied to three epistles in the New Testament (two to Timothy and one to Titus), written by the Apostle Paul near the close of his life; 2 Timothy bearing every mark of being the last epistle penned. (Philemon, though placed with the pastoral epistles in our Bibles, is not to be classed with them, since it was written at the same time with the Epistles to the Ephesians and Colossians. Philem. 10; Col. iv. 7, 9; Eph. vi. 21.)

The difficulties connected with these epistles have been set forth in the previous article, and the impression given that the Pauline authorship is improbable. "The majority of modern critics," it is asserted, "question or deny their authenticity," that is, their genuineness. But this assertion holds good only in the case of a certain school of critics. The difficulties have not led to a rejection of the epistles by any considerable portion of Biblical scholars, and the argument in favor of the genuineness is a very strong one.

The three letters stand or fall together. Every attempt to prove one of them Pauline and the others forgeries has failed from its inherent inconsistency. It has been fully shown by Dr. Hatch that they cannot be placed at any period in the life of the apostle up to the close of the two years named in Acts xxviii. 30. Yet he somewhat summarily disposes of the theory that they were written by the apostle, "subsequent to the close of the Acts of the Apostles." Most of those who accept these epistles as genuine hold that Paul was released from his imprisonment at Rome, and after a brief period of freedom was reimprisoned and beheaded. On the other hand, those who deny their genuineness object to this theory; indeed, the theory is frequently objected to, in order to deny the genuineness of the epistles. The controversies of this century have virtually narrowed the question to this single point, which is more probable, that Paul lived for some years after the time when the Book of Acts closed its narrative, or that these epistles are forgeries? The former is exceedingly probable, the latter equally improbable. As the improbability of the former and the probability of the latter have been fully set forth in Dr. Hatch's article, the other side should be stated here.

1. The probability that the Apostle Paul lived for some years after the time at which the Book of the Acts closes. (1) The patristic evidence, while open to discussion, is positive. The objections raised against this evidence do not weaken its force respecting the main point, namely, that the apostle was set at liberty after the two years' imprisonment at Rome, and made another missionary journey before his death. The silence of other early writers about this journey is not evidence. (2) The Book of Acts terminates in an abrupt manner, making no allusion to the death of the apostle. It therefore presents no evidence on the matter in question. But this silence respecting the martyrdom of the apostle is unaccountable, if that martyrdom took place at the time when the narrative closes. If, however, the apostle lived and labored for a few years after that time the conclusion of the Book of Acts is natural enough. The evangelist wrote it during the two years at Rome, and it was in circulation while the apostle was still alive. Even if it were written after his death, that fact would probably have been mentioned if it occurred at the time when the narrative closes. On the other hand, if a number of other events occurred in the later history of Paul the historian would omit all of them, because his purpose was accomplished, that of showing the establishment of Christianity in its new centre at Rome. This is "conjecture," not "evidence," but (3) the entire argument against the second Roman imprisonment rests upon "conjecture" rather than "evidence." It is urged by the critics who oppose this theory that Paul would have alluded to the Neronian persecution in the

pastoral epistles had he written these after that persecution began. But his silence is not so singular as the silence of the author of the Book of Acts about the death of Paul, if that occurred at the time the opponents of this theory claim. No positive historical statement can be adduced against the fact of a second Roman imprisonment. The internal evidence from the epistles themselves is constantly used to prove a later date than that of the other Pauline epistles. This is valid enough. But this evidence does not compel us to accept a date later than that allowed by the theory of a second imprisonment. Only by pressing terms and statements beyond their necessary meaning can a plausible argument for a sub-apostolic date be presented. Until the epistles are proven forgeries they themselves are competent witnesses as to the facts of the apostle's history. Those who accept them as competent witnesses rarely find a serious difficulty in constructing a consistent theory respecting the events in Paul's life subsequent to the two years' imprisonment at Rome, and in assigning to these epistles their respective places in that period of his life. The alternative is the spuriousness of the epistles.

2. The improbability of these epistles being forgeries. If spurious, they must be wilful forgeries; for they claim to be Pauline. Their contents include many personal allusions and direct commands, as if from the Apostle Paul. Every attempt to account for them as based upon briefer writings of the apostle has failed. The "patchwork" school of criticism has essayed to do it, but without success. As regards the genuineness of the pastoral epistles, the following statement must suffice: (1) The epistles have been well-nigh universally accepted as Pauline, and are included in the earliest lists of New Testament writings, as well as cited by very early fathers. (2) No motive for forging such epistles can be discovered, either in their contents or in any circumstances of the early church to which the contents would be pertinent. (3) As in the case of other epistles which have been doubted, no author can be found who could have written such epistles. The second century produced few Christian authors of mark. The works remaining to us are of a character so much below that of the Pauline epistles, these included, that one cannot even by "conjecture" hit upon an author. The contrast with the *Teaching of the Twelve Apostles* and the *Epistle of Barnabas* is obvious. Yet we are asked to believe that these epistles came into existence in the same age with these latter. (4) The historical difficulties themselves furnish an argument against the spuriousness of the epistles. A forger skilful enough to personate Paul so successfully as to deceive the church for 1800 years would have been skilful enough to make his historical allusions fit into the narrative of the Book of Acts. Nor is it improper to suggest that such a forger would hardly have taken pains to invent the incident about "the cloak at Troas" (2 Tim. iv. 13), and other minor details. (5) The objections raised on internal grounds have been repeatedly answered. (a) As to the contents, the pressing of "doctrine" is not singular. "Teaching" is meant, and these epistles were written to men who were organizing churches and superintending the induction of teachers into office. The errors combated are not necessarily those of a later period of the church than that usually assigned as the date of these epistles. The early and rapid growth of error is indicated in the undoubted Pauline epistles. Nor can there be found any particular age or error in the church, after the apostolic period, to which the language of these epistles would apply with such force as to suggest a forgery to meet that error in that age. (b) The objections from the peculiar words and the more simple style of the epistles amount to little. The purpose of the letters necessarily led to the use of words not pertinent in the other epistles. Arguments from the use of words are always precarious. Then, as to style; the involved structure so common in the other Pauline

epistles is absent here. It is the practical missionary who is speaking, advising, and exhorting his younger brethren. How far this modifies style every one knows who has attempted it. Huther remarks on this difference of style, but only to defend the genuineness. (c) The historical difficulties are met by the theory of a release from imprisonment at Rome and a subsequent reimprisonment, during which the last of the pastoral epistles (2 Timothy) was written. This allows sufficient time for the development of church organization and of error which the epistles indicate. For example: according to this theory 1 Timothy was addressed to Ephesus about A. D. 63. In A. D. 58 the church had a body of elders, and these are warned against the impending danger of erroneous teaching (Acts xx. 17-31). The five years' interval is long enough for the implied development. (6) The internal evidence of Pauline authorship is very strong. The personal allusions are not only frequent, but of such a character as to reveal the same great heart that manifests its presence in the Epistles to the Romans and Corinthians. Allusion has already been made to the minute details which indicate the genuineness of the epistles. It seems impossible to discuss the bearing of internal evidence with one who could believe that 2 Tim. iv. 6-8 was written by a forger, posing as the Apostle Paul.

3. While there are differences of opinion in regard to some details of the theory of a second Roman imprisonment, the following summary presents the main points of the apostle's life after the first Roman imprisonment, accepting the pastoral epistles as genuine and historically accurate. He was probably released from prison in A. D. 63, before the persecution under Nero began (A. D. 64). His first journey was probably to Ephesus, where he left Timothy (1 Tim. i. 3), proceeding thence to Macedonia, where 1 Timothy was written. His next journey was to Crete, passing through Troas and Miletus. In Crete Titus was left (Tit. i. 5), as Timothy had been in Ephesus. Their work was that of missionary superintendents, not that of local "bishops." How long they remained in this labor is not known. During this interval of freedom Paul seems to have spent a winter at Nicopolis (Tit. iii. 12) after writing the Epistle to Titus. Of further journeys we have hints in the Fathers, but no definite historical traces. He was rearrested, and during this imprisonment wrote a second letter to Timothy. Shortly afterwards he was beheaded at Rome, but the date is variously assigned between A. D. 66 and 68.

See further in article PAUL. The whole question is fully discussed in Schaff's *History of the Christian Church* (new ed., vol. i., pp. 798-808). (M. B. R.)

PATENTS. Previous to the Declaration of Independence patents were occasionally granted to individuals by the British colonial governments in North America. This power was exercised by the General Court of the colony of Massachusetts as early as 1641. In 1652 Connecticut in a statute prohibiting monopolies also provided for granting patents for new and beneficial inventions for such times as the General Court should deem meet. Such patents were, however, rare and our information in regard to them is vague and indefinite.

After the close of the revolutionary war there was considerable activity among American inventors, especially with regard to the application of steam-power to vessels and machinery of various kinds. (See EVANS, OLIVER.) The States of New York, New Jersey, Pennsylvania, Maryland, and Virginia granted to inventors whose projects seemed to promise success monopolies of navigating their waters with the aid of steam. The conflicting claims of inventors under powers derived from the State authorities had an influence in leading the Constitutional Convention in 1787 to incorporate among the powers of the general government that of granting patents.

By Art. I., sec. 8, of the Constitution of the United

States power was vested in Congress "To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries."

It is upon this provision that our copyright and patent laws are based. The first Congress in 1790 passed an act regulating the issue of patents for inventions. By its provisions the inventor was required to present a petition to the secretary of state, the secretary of war, or the attorney-general, setting forth the nature of his invention and asking for a patent. If this was approved by the above-named officers or any two of them the description of the invention was certified to by the attorney-general and the issuing of the patent was directed by the President. It was recorded in the office of the secretary of state and by him delivered to the patentee or his agent under the great seal of the United States.

Various other statutes were enacted subsequently, but the essential features of the law remained unchanged until 1836. Patents were granted on application with little or no scrutiny, and the duty of deciding whether the patentee was justly entitled to a patent was devolved wholly upon the courts. Hardly any attempt was made to prevent the issuing of a patent upon insufficient grounds. The interests of the public were supposed to be sufficiently protected by allowing the validity of the grounds upon which the patent was granted to be called in question at any time in case of a suit for infringement. After an experience of nearly half a century the inconvenience and injustice of this system had become manifest.

In 1836 the Patent-office was burned and many of the records destroyed. Congress embraced the opportunity to thoroughly revise the whole system. By an act passed in that year prior acts were substantially repealed and the present system substituted.

As at present organized the Patent-office is attached to the department of the secretary of the interior. It consists of the following officers: One commissioner, one assistant-commissioner, and three examiners-in-chief, all appointed by the President by and with the advice and consent of the Senate. All other officers, clerks, and employés are appointed by the secretary of the interior on the nomination of the Commissioner of Patents; they are: One chief-clerk, one examiner in charge of interferences, one examiner in charge of trade-marks, 24 principal examiners, 24 first assistant-examiners, 24 second assistant-examiners, 24 third assistant-examiners, one librarian, one machinist, 3 skilled draughtsmen, 35 copyists of drawings, one messenger and purchasing clerk, one skilled laborer, 16 attendants in the model-room, one examiner of designs. The combined salaries of these officers amount to \$261,200 per annum. The principal object of the great force of examiners above mentioned—one hundred in all—is to prevent the granting of patents for alleged inventions which are really not new and useful, and so to prevent individuals from acquiring a monopoly of inventions and improvements to the use of which the public were already entitled.

The general principles of the law of patents are the same in this country and in England. Among the peculiarities of the patent laws of the United States it may be mentioned that the term for which they are granted, seventeen years, is longer than in any other country. The development of the patent system in the United States far exceeds that of any other nation. For several years the number of patents issued in the United States has been nearly equal to the number issued by all other civilized nations together. A pamphlet containing the *Patent Laws and Laws relating to the Registration of Trade-marks and Labels*, and one containing the *Rules of Practice in the United States Patent-Office* are published by the office and can be obtained free of charge by any one desiring them on application by mail to the Commissioner of Patents. It is, however, practically impossible for an inventor

himself to prepare the papers, drawings, etc., necessary to obtain a patent, with the requisite degree of scientific and technical skill. "Patent lawyers" form a distinct branch of the profession and the inventor will find it in the end the cheapest as well as the surest course to intrust his case to an attorney who makes the practice of patent law a specialty. In a simple case, when no difficulties are encountered, and everything goes through in regular order under the direction of a reputable attorney, the cost of obtaining a patent may be stated as follows: Government fee on filing application, \$15; government fee on issuing patent, \$20; attorney's fee, \$25; making the total charge \$60. This may be regarded as the minimum of expense for securing a patent. But where the invention is of a complicated character, requiring great skill and care in the preparation of the descriptions and drawings, where difficulty is experienced on account of anticipatory inventions, real or alleged, where the application is rejected by the primary examiners and it becomes necessary to appeal from them to the board of examiners-in-chief, from these to the commissioner of patents, and from the commissioner to the Supreme Court of the District of Columbia, the expense will depend upon the circumstances of each case.

Owing to the destruction of the records of the Patent-office in 1836, the reconstruction of the history of invention in the United States previous to that year would involve a great amount of laborious and painstaking investigation and research. From that year to the present time the records are complete and accessible, and the number of patents granted in each succeeding decade may, perhaps, be taken as a fair index of the fertility of American inventive genius and the progress of American industries. The first patent granted after the reorganization of the Patent-office under the act of 1836 bears date July 28th of that year, and is No. 1 of the present enumeration. From that date up to and including the year 1846 the number of patents issued was 5019. During the next ten years ending with 1856, inclusive, the number of patents issued was 12,578. The ratio of increase was from 572 issued in 1847 to 2502 issued in 1856. During the decade ending with and including the year 1866 the number issued was 44,334. The number issued in 1857 was 2685, and in 1866 it was 8873. During the decade ending with and including the year 1876 the number issued was 125,155. The number issued in 1867 was 13,015, and in 1876 it was 12,870. This period of 10 years, 1867-76, is the only one in which the number of patents issued in the first year of the decade was greater than the number issued in the last. During the decade ending with and including the year 1886 the number of patents issued was 169,478. The number issued in 1877 was 13,117, while in 1886 the number was 21,796. During the year 1887 the number issued was 20,428.

The whole number of patents issued from July 28, 1836, up to and including Oct. 16, 1888, was 391,395. This is exclusive of what were termed "additional improvements," which were additions to original patents permitted under provisions of the act of 1836, which remained in force until the act of 1860. It is also exclusive of reissues, which down to the date mentioned, Oct. 16, 1888, numbered 10,963. It is also exclusive of "design patents," which down to the same date numbered 18,690.

Down to the year 1887 the number of patents issued to foreign inventors was 1466; the nationalities and numbers were as follows: English, 500; Canadian, 294; German, 291; Scotch, 28; Belgian, 35; and 1 each to citizens of Corea, Japan, Luxembourg, and Syria. If we take the year 1880 as an example, and compare the ratio of patents to population in the different States and Territories, the following are the highest and lowest results: in Connecticut, one patent to every 790 of the population; in the District of Columbia, 1 to every 895; in Massachusetts, 1 to every

950. The lowest ratio of patents to population was in Mississippi, 1 patent to every 25,146 of population; the next in Alabama, 1 to every 23,379; and the next in North Carolina, 1 to every 21,208.

The Patent-office is a self-supporting institution. There have been only eight years, the last of which was 1861, during the last half-century when the receipts did not exceed the expenditures. The receipts in 1837 amounted to \$29,289.08. During the year 1887 the receipts were \$1,144,509.60, the expenditures were \$994,472.22, leaving a surplus to the credit of the office of \$150,037.38 for that year. In many previous years the surplus has been much greater. The rooms of the Patent-office are notoriously overcrowded to an extent that is injurious to the health of the employes, and inconvenient both to them and the public in the transaction of business, notwithstanding the fact that the inventors of the country have paid a tax defraying all the expenses of the office and leaving a surplus many times exceeding what would be necessary to make much needed reforms. (W. M. F.)

PATERSON, a manufacturing city of New Jersey, the seat of Passaic co., is situated on the Passaic River, 16 miles from New York city, on the Erie, the Delaware, Lackawanna, and Western, the New York, Susquehanna, and Western, and the Paterson, Newark, and New York Railroads. The Passaic River, which flows through the city, and is crossed by many bridges, is noted for its falls, which furnish abundant water-power. The industrial establishments comprise a rolling-mill, three locomotive-works, a large iron-forge, numerous cotton- and paper-mills, but above all, 116 silk-mills, which give the city its distinctive place among the manufacturing cities of America. There are 5 hotels, 2 national banks, a savings bank, 5 daily and 9 weekly newspapers, 14 public schools, and good private schools, 2 hospitals, 2 orphan asylums, and some 50 churches. The city was settled in 1792, being named after Gov. William Paterson, who signed the town charter, and incorporated as a city in 1854. It is well laid out, is lighted with gas, and has water-works. The total debt in 1886 was over \$2,130,000, and the yearly expenses nearly \$1,189,000. The population in 1880 was 15,031.

PATMORE, COVENTRY KEARSEY DEIGHTON, English poet, was born at Woodford, Essex, July 23, 1823. At the age of 21 he published a volume of poems which attracted little attention. From 1846 to 1868 he was one of the assistant librarians of the British Museum, and in the meantime published the domestic poem, by which he is best known, *The Angel in the House* (1854-62). This work consists of four parts—*The Betrothal*, *The Espousal*, *Faithful for Ever*, and *The Victories of Love*. It is the most successful attempt to depict the poetic aspects of married life. Patmore has also published *A Garland of Poems for Children* (1862); *The Unknown Eros* (1877); a *Memoir of Barry Cornwall* and *Amelia* (1878). In later life he became a Roman Catholic.

PATON, SIR JOSEPH NOEL, a Scotch painter, was born at Dunfermline, Dec. 13, 1821. He studied his art in the Edinburgh Academy and the Royal Academy, London. In 1844 he exhibited at the Royal Scottish Academy his first painting, *Ruth Gleaning*. In the next year he obtained at Westminster Hall, London, a prize for a fresco of *The Spirit of Religion*. In 1847 his large oil-painting of *Christ Bearing the Cross* and a small one representing *The Reconciliation of Oberon and Titania* were jointly awarded a prize of £300. The latter picture was purchased for the Scottish National Gallery, which also obtained its companion picture, *The Quarrel of Oberon and Titania* (1846). He has also taken delight in allegorical subjects, among which are *The Pursuit of Pleasure* (1855); *Mors Janua Vitæ* (1866); *Faith and Reason* (1871); *The Spirit of Twilight* (1876). Of his paintings of religious subjects may be noted *Christ and Mary at the Sepulchre* (1872); *The Man of Sorrows* (1875), and *Christ*

the Good Shepherd (1876). He has published outline etchings of Shakespeare, Shelley, and other poets. The works of the great poets have also furnished subjects for his paintings. A ballad of the Scottish border, "The Dowie Dens of Yarrow," has been illustrated by a series of six pictures. He was made Queen's Limner for Scotland in 1866, was knighted in 1867, and in 1876 received the degree of LL.D. from the University of Edinburgh. He has published two books, *Poems by a Painter* (1862) and *Spindrift* (1866). His brother, Walter Paton, born in 1825, has some note as a landscape painter.

PATRICK, MARSENA R. (1811-1888), general, was born at Houndsfield, Jefferson co., N. Y., March 15, 1811. He graduated at West Point in 1835 and served in the Mexican war, being made captain and brevet-major. He resigned in 1850 and in 1859 was made president of the New York State Agricultural College. The outbreak of the civil war in 1861 called him again to arms, and he was made inspector-general of militia. In 1862 he served with the army of the Potomac and fought at Antietam. He then was made provost-marshal-general of that army, and afterwards of all the armies operating against Richmond. He resigned in 1865 and was afterwards president of the New York State Agricultural Society. In 1880 he was made governor of the Soldiers' Home, Dayton, Ohio, and died there Aug. 5, 1888.

PATRONS OF HUSBANDRY. See GRANGERS.

PATTERSON, CARLILE POLLOCK (1816-1881), superintendent of the Coast Survey, was born at Shieldsborough, Mass., Aug. 24, 1816. He was the son of Capt. Daniel Tod Patterson, U. S. N. (1786-1839), and entered the navy in 1830 as a midshipman. After serving five years in the Mediterranean he returned to pursue an engineering course in Georgetown College. In 1838 he entered on the work of the coast survey, but also had navy service occasionally until 1850, when he became captain of a Pacific mail steamer. In 1861 he resumed work in the Coast Survey and in 1874 he was made superintendent. Under his administration the work was enlarged to be a general geodetic survey. He also assisted in other departments of the naval service, and was for many years a member of the lighthouse board. He died at Washington Aug. 15, 1881. His only writings were *Reports* of his work.

PATTERSON, ROBERT (1792-1881), general and manufacturer, was born at Cappagh, Ireland, Jan. 12, 1792, but was brought at an early age to Pennsylvania. In the war of 1812 he was a first-lieutenant, and afterwards engaged in manufacturing and in local and State politics. In the Mexican war he was major-general of volunteers and served with Gen. Scott, fighting at Cerro Gordo and capturing Jalapa. On the outbreak of the civil war Patterson entered the service with the three-months volunteers and had charge of a military department extending from Pennsylvania to Washington. Having crossed the Potomac at Williamsport on June 15, he was instructed to watch Gen. J. E. Johnston's force at Winchester, while Gen. McDowell advanced from Washington. Johnston, however, joined Beauregard, and McDowell was thus defeated. Patterson was greatly blamed, but asserted that he had been directed to wait for orders from Washington, which never came. His commission expired July 27, 1861, and he retired to private life. He published a *Narrative of the Campaign in the Shenandoah* (1865). He continued active in business until his death, Aug. 7, 1881.

PATTERSON-BONAPARTE. See BONAPARTE.

PATTI, ADELINA, singer, was born at Madrid, Feb. 19, 1843. Her father and mother were Italian musicians, and she was taught in childhood by her brother, Signor Barilli. At the age of seven she made her first appearance at a concert and soon earned enough to secure thorough musical training. In November, 1859, she appeared in New York as Lucia and achieved the highest success as a singer and actress.

In 1861 she went to London, in 1862 to Paris, and thereafter appeared in all the European capitals. In England and the United States she has frequently appeared in concert, as well as in opera. She was married to Marquis de Caux, a French nobleman, in 1868, but was divorced in 1883, and in 1886 was married to Ernesto Nicolini, an operatic singer.

Her sister **CARLOTTA** was born at Florence in 1840, and was early trained for the stage. A slight lameness interfered with her success in opera, but she became noted as a concert-singer. She had first appeared at New York in 1861, and afterwards went to Europe, where she gave hundreds of concerts. Her voice is a soprano of remarkable range. She was married in 1879 to Ernst de Munck.

PATTISON, MARK (1813-1884), English author and educator, was born at Hornby, Yorkshire, in 1813. His boyhood was spent at Hauxwell, near Richmond, where his father was rector. He was educated at Oriel College, Oxford, graduated in 1836 and was made a fellow of Lincoln College in 1839. Though Newman's connection with Oriel College had ceased before Pattison entered, the whole of Oxford was still permeated by his influence, and Pattison was reckoned among his closest followers. He was ordained priest in 1843 and took some theological prizes, but after Newman's withdrawal from the Anglican Church, Pattison devoted himself steadily to his college duties as examiner and tutor. In 1851 he failed to get the rectorship of Lincoln College, which seemed then his due, and his subsequent life showed the effect of the disappointment. His essay on "The Tendencies of Religious Thought in England," one of the famous *Essays and Reviews* (1860), proved that Newman had had little permanent influence on his mind. Pattison made a *Report on Elementary Education in Germany* in 1859 and at last obtained the rectorship of Lincoln College in 1861. But his former activity in education was gone. Thoroughly a scholar, devoted to research, he wished the endowments of the universities to be used for the promotion of original literary and scientific research. His *Suggestions on Academical Organization* (1867) may have led to the movement which has been partially successful in that direction. His literary work, besides contributions to the *Quarterly* and other periodicals, is to be found in editions of some works of Milton and Pope, and especially in his *Life of Casaubon* (1875). He had originally intended to write a biography of Scaliger, but was diverted from his purpose by learning that Prof. Jacob Bernays had undertaken that subject. In the last months of his life he dictated some *Reminiscences* (1885) in which he pathetically protests against the caricature of himself given in George Eliot's *Middlemarch* and also against the romantic version of his sister's life given in Miss Lonsdale's *Sister Dora*. He died June 30, 1884. His widow became the wife of Sir Charles W. Dilke.

PATTON, FRANCIS LANDEY, theologian, was born in Bermuda, Jan. 22, 1843. He was educated at University and Knox College, Toronto, and studied theology at Princeton. He was ordained to the Presbyterian ministry in 1865, and had charge of churches in New York, Nyack, and Brooklyn. In 1871 he was made professor of didactic theology in the Presbyterian Seminary at Chicago, and he was also editor of the *Interior*, 1873-76. He prosecuted Rev. David Swing, a popular preacher, before the Presbytery of Chicago for heresy, and procured his conviction and suspension. He was moderator of the General Assembly at Pittsburgh in 1878. He became pastor of the Jefferson Park Church in 1879. In 1881 he was called to Princeton Theological Seminary as professor of science and philosophy in their relation to religion. In 1888 he was chosen to succeed Dr. James McCosh in the presidency of Princeton College. He has been a frequent contributor to religious periodicals and has published *Treatise on Inspiration* (1869); *Summary of Christian Doctrine*; *Doctrine of Future Retribution*.

PAUL. The full sketch of the Apostle Paul's life in the *ENCYCLOPÆDIA BRITANNICA* suggests many doubts in regard to the trustworthiness of the New Testament records. But of all ancient historical books there is not one that has been so thoroughly tested as the Acts of the Apostles. The many points of contact with Roman history, Greek usage, and Mediterranean topography furnish sufficient data to establish the accuracy of the writer. As regards the Pauline epistles, the most destructive critics admit the genuineness of four (Galatians, 1 and 2 Corinthians, and Romans). These epistles are in themselves sufficient to show the character and teachings of Paul. They attest the fact that Christianity was widely diffused in A. D. 58. The genuineness of the other Epistles has not been successfully impugned. The objections arise from preconceived theories in regard to the apostolic age. (The Epistle to the Hebrews, of course, occupies an exceptional position. See *HEBREWES*.) The strongest array of probabilities is made against the pastoral epistles, but the objections raised have been answered repeatedly (see *PASTORAL EPISTLES*). The following sketch assumes the authenticity of the narrative in the Acts of the Apostles, as well as the genuineness of the epistles bearing the name of Paul.

1. *Life of the Apostle.*—Saul was born at Tarsus in Cilicia (Acts ix. 11; xxii. 3); he was of the tribe of Benjamin (Phil. iii. 5; 2 Cor. xi. 22), and by birth a Roman citizen (Acts xvi. 37; xxii. 28). He was educated at Jerusalem under Gamaliel (Acts xxii. 3; xxvi. 4, 5). But he seems never to have seen the Lord Jesus during His ministry (1 Cor. vi. 1; xv. 8). This does not invalidate the previous statement about his education, since our Lord's ministry lasted at most only three years and a half. Saul first appears in the Acts of the Apostles as a young man zealous for the death of Stephen, the first Christian martyr (Acts vii. 58; viii. 1). How old he was at this time is uncertain. It is inferred by some from Acts xxvi. 10 that he was a member of the Jewish Sanhedrin, but the "vote" referred to may have been in some lower tribunal. His Jewish zeal seems to have placed him at the head of the persecution that arose after the death of Stephen (Acts viii. 3; ix. 1, 2), and on the way to Damascus as the emissary of the high-priest he was converted to Christ by an appearance of the Lord himself. Three accounts of this occurrence are given in the Acts (ix. 1-19; xxii. 3-16; xxvi. 19-20), and there are many allusions to it in the epistles. Thus his life was transformed, and he never ceased to assert that he had seen the Lord. To deny a real objective appearance on this occasion is to assert that Paul was either a deceiver or himself deceived. The date of this conversion is probably A. D. 37 (see below).

The completeness of the change is emphasized in all the narratives, and the conversion seems to have been regarded by Saul himself as a call to the apostleship. He at once began to preach at Damascus (Acts ix. 19, 20), but soon retired to Arabia (Gal. i. 17), spending the larger part of three years in quiet preparation. Returning to Damascus, he met with persecution from the Jews (Acts ix. 23, 25; 2 Cor. xi. 32, 33), but escaped to Jerusalem, where the disciples seemed doubtful respecting him (Acts ix. 26), but Barnabas befriended him.

This visit to Jerusalem is, for convenience, called the "first," and the date was about A. D. 40. It lasted for fifteen days (Gal. i. 18); during which he received a direct revelation of his mission to the Gentiles (Acts xxii. 17-21). He met the Apostle Peter and James, the Lord's brother, but his knowledge of the gospel was not derived from them (Gal. i. 11, 19). Driven away by the enmity of the Jews, he goes to Tarsus, and afterwards was brought to Antioch by Barnabas, with whom he made his "second" visit to Jerusalem

(A. D. 44), bearing alms from the disciples in the former city (Acts xi. 25-30).

Shortly after (A. D. 45), under the special direction of the Holy Spirit, given through the church at Antioch, the apostle begins his recorded missionary activity, in company with Barnabas and John Mark (Acts xiii. 1-3, 5). Landing in Cyprus, the native country of Barnabas, they pass from Salamis to Paphos, where a Jewish sorcerer is rebuked and punished, and the Roman proconsul, Sergius Paulus, is converted (Acts xiii. 5-12). As the name Paul occurs from this point onward in the narrative, the change has been connected with this event, but it is more probable that the apostle had both names. Departing to Perga, on the coast of Asia Minor, John Mark deserts them (Acts xiii. 13). Moving northward to Antioch in Pisidia, the preachers meet with marked success among the Gentiles, and formally announce their mission to the heathen (Acts xiii. 14-52). Passing to Iconium they gain many converts, but arouse great enmity, and flee to Lystra and Derbe. A cripple is miraculously healed in the former city, when the inhabitants attempt to worship the preachers (Acts xiv. 8-18). But opposition follows them; Paul is stoned; the missionaries retrace their steps and return to Antioch (Acts xiv. 19-28).

Dr. Hatch claims that this record must omit many of the labors of the apostle during the eleven years from the first to the third visit to Jerusalem. Probably he did preach in Cilicia and elsewhere, but we have no narrative of these labors. The suggestion that the story of this period is derived from a lost *Acts of Barnabas* is characteristic of the method pursued in the article in the *ENCYCLOPÆDIA BRITANNICA*. Well-authenticated and consistent narratives in our possession are treated as of doubtful authority; but "lost" books are more confidently dealt with.

About A. D. 50 Paul makes a third visit to Jerusalem, of which we have two accounts: one in Acts xv. 4-29, giving the external history, and another by Paul himself (Gal. ii. 1-10), telling of the private conferences. (The literature is given by Dr. Hatch.) Paul was recognized as an apostle of the uncircumcision; it was decided that Christianity was not the religion of a Jewish sect. It would appear from the entire discussion, that Paul claimed to be, not one of the twelve, but an apostle independent of the twelve. Practically the same claim was asserted in the conflict with Peter at Antioch, shortly after (Gal. ii. 11-16), when the latter "drew back and separated himself."

In the second missionary journey Paul was not accompanied by Barnabas, for "a sharp contention" arose between them respecting Mark, a relative ("cousin," Col. iv. 10, R. V.) of the latter. Other causes may have entered. The church at Antioch seems to have been mainly on the side of Paul (Acts xv. 40), and there is no warrant for speaking of the "failure at Antioch," since Paul returned there and remained some time (Acts xviii. 22, 23). The details of this second journey (A. D. 51-4) are given in Acts xvi.-xviii., and few important incidents seem to be omitted from the account. First visiting the disciples in Syria and Cilicia, he proceeds through Phrygia and Galatia, having with him Silas and Timothy (Acts xvi. 1-6). Direct intimations from the Holy Spirit led them to Troas, where a heavenly vision shows them the way to Macedonia (Acts xvi. 6-12). Luke seems to have been of the company from Troas to Philippi, the first European city in which Paul preached. A purple-dealer, named Lydia, was the first convert. Coming into conflict with heathen superstition and covetousness through a miracle of healing, Paul was imprisoned, together with Silas, but miraculously delivered and honorably released as a Roman citizen (Acts xvi. 16-40). At Thessalonica, the next place of labor, success followed, but the Jews raised a mob against the preachers. The enmity of the Jews of Thessa-

lonica drove Paul away from Beroea also, and in Athens he came into public contact with philosophic heathenism, delivering in the Areopagus the well-known discourse (Acts xvii.), in regard to which Dr. Hatch raises needless difficulties.

In Corinth, the next city visited, the labors of Paul assumed a more settled character. In this important commercial centre he remained eighteen months. Thence he wrote two letters to the Thessalonians, and despite the obstacles to the gospel he founded an important church in Corinth, in regard to which we learn much from the two letters afterwards written to the Corinthians. In the spring of A. D. 54 Paul left Corinth, touching at Ephesus and Cæsarea on the way to Jerusalem, whence he returned to Antioch, remaining there some time (Acts xviii. 1-23), probably until the close of the year.

The third missionary journey began with a visit to the Christian communities in Galatia and Phrygia (Acts xviii. 23). Paul then came to Ephesus (Acts xix. 1), where he remained for some time. [Dr. Hatch objects to the division into "missionary journeys," intimating that Paul determined about this time "to change the centre of his activity from Corinth to Ephesus." But the narrative in Acts gives no warrant for this assertion.] Some incidents of Paul's life at Ephesus are given in Acts xix., and others may be inferred from the letters written during this journey (Galatians, 1 and 2 Corinthians, and Romans). The first was probably written from Ephesus, though some place it later, at Corinth. The first Epistle to the Corinthians was undoubtedly penned at Ephesus, and the second from Macedonia, during the journey spoken of in Acts xx. 1, 2. The Epistle to the Romans was written from Corinth, where Paul remained three months (Acts xx. 3; comp. Rom. xvi. 1). The record in Acts is very brief at this point, but the personal incidents in the letters are numerous. We see from these the opposition which pursued the apostle, partly from Jewish prejudices (as in Galatia) and partly from factions and immoral usages, etc. (as in Corinth). During this period, beginning in Ephesus, Paul instituted a system of collections for the poor saints in Judæa, as all the accounts indicate. To carry this contribution to Jerusalem he made a fifth visit, which proved to be the last. A plot laid by the Jews at Corinth led him to alter his route, and we find in Acts xx. 3 to xxi. 14 an account of the journey written by an eye-witness. The route was through Philippi, Troas, and Miletus (where Paul met the elders of the Ephesian church); thence to Tyre and Cæsarea.

The apostle arrived in Jerusalem before Pentecost (A. D. 58), when the city was crowded with Jews from all regions. [Dr. Hatch takes pains to cast doubt upon the narrative in the Acts respecting Paul's conduct at Jerusalem, and indeed seeks to prevent "any certain light" emerging from any of the N. T. documents that belong to the later years of Paul's life.] Meeting the elders of the church, it was suggested to Paul, as a matter of prudence, that he appear in the temple with certain Nazirites, thus to prove that he had not taught the Hellenistic Jews to forsake the law of Moses, as had been charged (Acts xxi. 17-25). While carrying out this suggestion, Paul was set upon by some fanatical Jews from Asia (the Roman provinces, of which Ephesus was the capital), who charged him with profaning the temple. Dragging him out of the sacred enclosure, lest his blood might defile it, they attempted to kill him, but he was rescued by Claudius Lysias, the Roman tribune, who appeared with his soldiers. This officer, after giving Paul an opportunity to address the people, and discovering that he was a Roman citizen, sent him to the Sanhedrin, where the Pharisees and Sadducees were divided in opinion respecting him. The discovery of a plot led the tribune to send his prisoner to the procurator Felix at Cæsarea, where he was kept in mild custody for two years, awaiting a trial which never came. The story is told in

Acts xxiv. (Some assign the Epistles to the Colossians, Ephesians, and to Philemon to this period, but all were probably written at Rome.) When a new procurator came in the place of Felix, Paul appealed to the tribunal of the emperor, exercising his right as a Roman citizen. Thus the way was to be opened for fulfilling his desire to preach at Rome (comp. also Acts xxiii. 11). Having made a masterly defence before the new governor (Festus) and Agrippa (Herod Agrippa II.), Paul was sent, with other prisoners, to Rome, in the autumn of A. D. 60. A vivid account of the voyage and shipwreck occurs in Acts xxvii., xxviii. [It is impossible to avoid noticing the doubts cast upon this account by Dr. Hatch in the *ENCYCLOPÆDIA BRITANNICA*. If these chapters cannot be trusted, then no record of antiquity can be termed historical.]

Rome was reached in the spring of the following year. Here two years were spent in mild imprisonment, which did not prevent the apostle from active labor. He preached to the soldiers, wrote four of his Epistles (Colossians, Ephesians, and Philemon; these three about the same time, and, probably afterwards, Philippians).

The Acts of the Apostles tells us nothing more. This is strange, if Paul was beheaded at the close of this imprisonment. Furthermore, the pastoral epistles cannot well be placed at any point before this. Accordingly it seems safe to accept as fact the statement of some early Fathers that Paul was released, and then, after a second imprisonment at Rome, beheaded at some time between A. D. 66 and 68. (For details of these later years, see *PASTORAL EPISTLES*.)

2. *The Chronology of Paul's Life*.—Two dates can be fixed with reasonable certainty: (1) The death of Herod Agrippa I. took place in A. D. 44, and the second visit to Jerusalem occurred about the same time (Acts xi. 30 and xii.). (2) The governorship of Festus began in A. D. 60, and the voyage to Rome occurred shortly after. Starting from these dates we can approximately determine the time of the leading events of the apostle's life; but the Jewish mode of counting parts of years as full years prevents accuracy, and has led to the great variety in the chronological tables. In some cases there are incidental reasons tending to confirm the assigned dates.

	A. D.
Date of conversion.....	37
First visit to Jerusalem.....	40
Second visit to Jerusalem.....	44
First missionary journey.....	45
Third visit to Jerusalem (council).....	50
Second missionary journey.....	51-54
Fourth visit to Jerusalem.....	54
Third missionary journey.....	54-58
Last visit to Jerusalem (spring).....	58
Imprisonment at Cæsarea.....	58-60
Voyage to Rome.....	60-61
First imprisonment at Rome.....	61-63
[Release.....	63
[Reimprisonment and martyrdom.....	66 or 68

There are various theories which would modify the above list of dates, but it presents a working theory and preserves the events in their relations, so far as recorded. (See Schaff, and many others.)

3. *The Writings of Paul*.—The epistles may be divided into three groups, according to the time of composition: (1) The *earlier epistles*, 1 and 2 Thessalonians (A. D. 53), Galatians, 1 and 2 Corinthians, and Romans (57 and 58). Some place Galatians immediately before Romans. (2) The *epistles of the captivity*: Colossians, Ephesians, Philemon, and Philippians (A. D. 61-63). Some place Philippians first in this group. (3) The *pastoral epistles*, written after the first Roman imprisonment. In connection with the last group there is the uncertainty, to which reference has already been made, respecting the closing events in the life of Paul. The Epistle to the Hebrews is anonymous, and the question of authorship has been

discussed in the article on that epistle. (See HEBREWS, EPISTLE TO THE.)

These writings are all of them letters, not merely theological or didactic treatises. Most of them have a definite occasion, and each a distinct purpose. They are human to the last degree, yet nowhere do we find more marked evidence of Divine inspiration, which the apostle vehemently claims for the gospel he preached (Gal. i. 8-11). A brief characterization of these writings, according to their contents, is given here: Romans, on salvation by faith for all who believe; 1 and 2 Corinthians, personal, in view of the divisions and sins at Corinth. [The view that another letter to the Corinthians was written, and has been lost, is not improbable in itself; but the passages in 2 Corinthians (ii. 3, 4; vii. 8-12) which seem to point to such a letter are by no means conclusive. If there was such a letter, it probably contained only matter affecting the local church in its then condition.] Galatians, in defence of his apostleship and doctrine (against Judaizing teachers); Ephesians, of the church in Christ; Philippians, a personal and affectionate letter; Colossians, on Christ the head of all things (with a rebuke of certain errors); 1 and 2 Thessalonians, to correct certain errors about the coming of Christ; 1 and 2 Timothy and Titus, for the guidance of these Christian teachers; Philemon, a personal letter, sent by Onesimus who was returning to his former master. (See ROMANS, EPISTLE TO THE.)

The Pauline theology can only be learned from these epistles. An effort has been made to find in them glaring inconsistencies; now to deny the genuineness of one or the other, and again to emasculate Christianity by denying the possibility of logically formulating the views of its earliest teachers. A persistent attempt to prove the apostle out of harmony with the teachings of the other apostles has been successfully met by recent Christian apologists. We may remark (1) The meaning of the terms used by Paul can be as accurately determined as in the case of any ancient writer. (2) The obscurity arises from the greatness of the thoughts. (3) The leading positions taken by him are obvious to all who interpret by the historico-exegetical method. (4) The difficulties that have arisen are largely due either to the mystical (allegorizing) method of interpretation, or to the influence of ecclesiastical dogmatism, or to both. (5) The teachings of Paul all assume a practical character, from his burning conviction that salvation in Christ was designed and adapted for all classes, Jew and Gentile alike. Hence he emphasizes the free grace of God, justification by faith, new life in the spirit over against the old life in the flesh; all these in such a way as to make it appear that Jew and Gentile alike can share in these privileges, and need to share in them. Dr. Hatch, in the BRITANNICA article, fails to do justice to Paul's use of the term "flesh." It means in the ethical sense, human nature as it is by birth, estranged from God, before regeneration by the Holy Spirit. (See ROMANS, EPISTLE TO THE.) (6) Out of this grows the culminating thought of the Apostle Paul's theology—Jew and Gentile united in one body in Christ (Eph. i.-iii.).

Assuming that these epistles (or any number of them) are genuine, we have in them the strongest contemporary evidence to the facts respecting Jesus Christ that are recorded in the Gospels. It is a characteristic of modern apologetics that it starts with the four undoubted epistles of Paul (Galatians, 1 and 2 Corinthians, and Romans), and shows from these writings that in A. D. 58 an immense number of people believed in Jesus Christ, and that Paul preached a Saviour, who had been crucified and raised again from the dead. The main facts he presents as facts, and it was the power of this historical Person that had transformed him. Modern skeptical criticism is simply an unavailing effort to escape the legitimate inference from these acknowledged facts respecting Paul and the gospel he preached. Either he was an impostor or a de-

luded fanatic, or the gospel facts are facts, and his explanation of them a Divine revelation.

4. *The Character of the Apostle Paul.*—Before his conversion Paul led a blameless life, according to the conceptions of Jewish morality (Phil. iii. 4-6). The description of the life under the law portrayed in Rom. vii. 7-13 is probably applicable to his religious condition as a conscientious Jew. It may have been his fierce striving to quiet an awakened conscience that made him a persecutor. Immoral, in the ordinary sense, he certainly was not, though he speaks of himself as "the chief of sinners" (1 Tim. i. 15). The same man became a Christian, and the same characteristics pervaded his after life, which now had new motives and aims. The persecutor of the Nazarenes became the Apostle to the Gentiles. What his physical infirmity was cannot be certainly determined. His personal appearance seems to have been far from prepossessing. But of his zeal, his intellectual power, his acuteness of thought, his decision of character there can be no question. It is too frequently imagined that he did not win affection from men. The greatness of his intellect and the tremendous results of his didactic statements have led many to forget how greatly beloved he was by his companions. Some contrast him with the Apostle John, regarding the latter as affectionate even to weak amiability, and implying that Paul was harsh and forbidding. But all the records prove him to be a man who won the personal affection of those associated with him. His practical wisdom is often obscured by those who would deem him the great "dogmatist." Yet the whole story of his life is full of instances of his tact, his wise dealing with men and with difficult questions. Add to this the indications we have of a widespread system of missionary labor, directed by him even when in prison; and it will appear that few men in history were so symmetrical in greatness: great in intellect, great in affection, great in will. But in the presence of his Master he calls himself "less than the least of all saints."

How such a life and character as his can be accounted for he himself tells us. No other satisfactory explanation of the phenomena has ever been suggested. Whenever the statements he emphasizes have been adequately recognized by men, similar characters have been formed, and under no other influences.

(M. B. R.)

PAULDING, HIRAM (1797-1878), rear-admiral U. S. N., was born in Westchester co., N. Y., Dec. 11, 1797. His father, JOHN PAULDING (1758-1818), was one of the captors of Major André, and was himself thrice taken prisoner in the Revolutionary war. For the capture of André, Paulding and his two companions received from Congress a silver medal and annuities of \$200. A monument to his memory was erected at Peekskill in 1827 by the city of New York. Hiram entered the U. S. Navy in 1811 as midshipman and served in McDonough's fleet on Lake Champlain. He was made lieutenant in 1816 and accompanied Capt. Porter in his expedition against the West Indian pirates in 1823. Rising to the rank of captain in 1844 he cruised with the Vincennes three years in tropical waters. In 1857 while commanding the Home squadron he broke up Walker's expedition against Nicaragua and brought the filibusters to the United States. The State of Nicaragua in 1860 acknowledged his service by the gift of a sword, Congress not allowing him to accept more. Paulding was made rear admiral on the retired list in December, 1861, but as commander of the New York navy-yard he rendered important service in preparing vessels for various employment during the civil war. He also assisted in protecting public property during the draft riots of New York city in 1863. After the war Paulding was for a time governor of the Naval Asylum in Philadelphia. He died at Huntington, L. I., Oct. 20, 1878, being then the senior officer on the retired list.

PAUPERISM. See CHARITY ORGANIZATION.

PAWNBROKING is the lending of money for a certain rate of interest on the security of goods, such as jewelry, apparel, utensils, or tools, deposited with the lender. Practically it has existed since a remote antiquity, but it became a recognized business in Europe during the Middle Ages. The merchants of Lombardy who established themselves in the principal cities of England and the Continent were in the habit of lending money on pledges of jewels and costly articles. In course of time the business passed to other hands, but the pawnbroker's familiar sign of the three gilt balls is traced to the coat of arms of the Medici family, who were the most enterprising of the Lombardy merchants. Their business was with kings, nobles, and wealthy merchants, but as its advantages became known, efforts were made to extend such benefits to other classes. Soon the poor, too ignorant to understand, too weak to maintain their rights, were grossly oppressed by the usurers. Christian charity came to their relief and established in Italy in the latter part of the fifteenth century the *monte di pietà*. In the course of the next century such institutions were found in France, under the name *mont de piété*. These were at first charitable institutions, which charged only a rate sufficient to cover the necessary expenses. In Italy they have maintained this character until the present time. In France and other European countries they have been under the control of the government since the middle of the eighteenth century. Their transactions are strictly regulated by law and administered by public agents. In Paris there is one principal establishment and three auxiliary offices. There are also authorized commissioners stationed in different parts of the city, but whose transactions do not bind the administration until ratified at the central office. Here there is a board of appraisers; and the loan is limited to two-thirds of their valuation of the article, except in case of articles of gold or silver, when four-fifths may be advanced. The least sum lent is three francs, but there is no upper limit to the demand. The commissioners, who carry on four-fifths of the business, receive 2 per cent. for each pledge effected and 1 per cent. for each redemption. The rate of interest is 9 per cent. per annum, but the first month's instalment must be paid in advance, and the rest fortnightly. The loan is for a year, and if the article is not then redeemed it is sold within a month at public sale; in some cases the loan may be renewed for another year. Sometimes too the pawn is allowed to demand the sale of his pawn before the expiration of a year. For the maintenance of the business certain revenues from other sources may be drawn upon, yet there is generally a small balance in favor of the administration.

In England pawnbroking is conducted in private establishments which are regulated by law. Attempts at establishing *monts de piété* have never succeeded. In the United States the business is regulated by the law of the several States. Usually the mayor of a city has the sole power of issuing a license to a pawnbroker, who is required to be a person of good repute. In New York the rate is limited to 25 per cent. per annum, on sums less than \$25, and to 7 per cent. on sums beyond that amount. Yet the rate usually charged is 3 per cent. a month and there are further charges for storage, safe-keeping, etc., which materially reduce the sum received by the pawn. The unredeemed pledges are required to be sold at public auction, and the law also declares that the amount received for any article over the pawnbroker's just claims shall be returned to the depositor. The shops are generally found in the business streets of the poorer districts of the cities, and are more used by the foreign population than by the native-born. The keepers as a rule avoid receiving stolen goods, but there are persons, known as "fences," who make a business of receiving and disposing of stolen property, and for this purpose profess to keep a pawn-shop. (J. P. L.)

PAWNEES, a tribe of American Indians, who

originally resided chiefly in Nebraska, but extended into Kansas and Texas. They were noted on Marquette's map in 1673. From them the Arickarees (q. v.) separated and wandered northward. Some tribes formerly existing in Louisiana are also thought to belong to the same family. The Pawnees (or Pani) proper were bold hunters, excellent horsemen, and fierce warriors. They carried on constant war with the Sioux, Tetans, Arapahoes, Sacs and Foxes, and other tribes. They frequently offered human sacrifices to the sun, and this practice was continued in the present century. They lived in lodges covered with earth, and the women cultivated some grain, but the men hunted the buffalo. When the Delawares were removed to the land south of the Platte they came in collision with the Pawnees, and in 1832 burnt the Great Pawnee village on Republican Fork. By treaty with the United States in 1833 the Pawnees gave up their claim to land south of the Platte, received aid, and for a time made notable progress in civilization, but this excited the envy of their hereditary enemies, the Sioux, who finally drove them from their villages. The U. S. Government having withdrawn aid and protection, the tribe was soon reduced to half its original number. In 1861 they furnished many scouts to the Union army and took part in the campaign in Minnesota against the Sioux. The latter, after being reduced to peace, sought revenge on the hapless Pawnees, who were compelled to sell their lands and emigrate to a reservation in the Indian Territory. The total amount of this land is 283,020 acres (100,000 tillable), and when the entire tribe was finally removed to it in 1876 they numbered 2026. Part of the land, 53,000 acres, was purchased from the Creeks by the U. S. Government with the proceeds of the sale of Pawnee lands in Nebraska, but the title has not yet been transferred to the Pawnees. The other part was ceded by the Cherokees to the U. S. Government in trust for the Pawnees. Under Pres. Grant's administration the missionary work among the Pawnees was assigned to the Society of Friends. They are peaceable and well disposed, but have steadily diminished in number, until in 1887 they were reported as only 918, of whom 800 wore citizen's dress. They cultivated 2094 acres and had 2597 under fence. They cultivated wheat, corn, melons, and vegetables. They had 1400 horses, 575 cattle, 200 swine.

PAWTUCKET, a city of Rhode Island, in Providence co., is on Pawtucket River at its falls, 4 miles N. of Providence, and 40 miles from Boston, and on the Boston and Providence, the Providence and Worcester, Old Colony, New York and New England, and the Moshassuck Valley Railroads. It has 4 hotels, 3 national banks, 3 savings banks, 1 daily and 2 weekly newspapers, 25 churches, numerous schools, including a high-school, and a public library. The falls give abundant water-power, which is largely utilized in cotton-, woollen-, hair-cloth-, thread-, and other mills, the total establishments being nearly one hundred. Here Samuel Slater first introduced cotton-manufacturing into the United States. Pawtucket is lighted with gas and electricity, and has excellent water-works and a paid fire-department. Its property is valued at \$20,000,000; the public debt is \$1,100,000, chiefly due to the water-works; the yearly expenses are about \$250,000. Pawtucket was settled about 1640, and belonged to Massachusetts until 1862. It was incorporated as a town in 1874, and as a city in 1886. The population of the township in 1880 was 19,630.

PAYER, JULIUS, BARON, an Austrian explorer, was born at Schönau, Sept. 1, 1842. He was educated at the Military Academy in Vienna, and entered the service as lieutenant in 1859. For a time he was professor of history in the Academy and again was engaged in scientific work in the Austrian Alps. In 1869 he took part in the Polar expedition under Capt. Koldewey, which explored the east coast of Greenland and penetrated into the interior. Returning to Bremen

in September, 1870, he joined Weyprecht in preparations for a new expedition, which were enthusiastically supported by the whole empire. The steamer Tegethoff started in July, 1872, passed the winter at Nova Zembla, and then drifted northward, enclosed in ice. In October Payer discovered the land, which eventually proved to be as large as Spitzbergen, and named it Franz Josef in honor of the emperor. For details of his explorations see ARCTIC EXPLORATION. The farthest point reached was 82° 5' N. lat. After his return to Austria Payer was made Baron and soon resigned his commission in the army. He then settled at Frankfort, but afterwards removed to Munich, where he became a painter. As his first work in this line he exhibited in 1884 *The End of the Franklin Expedition*. Besides several geographical monographs he published a full account of his expedition (Vienna, 1876).

PAYNE, JOHN HOWARD (1792-1852), the author of "Home, Sweet Home," was born in New York, June 9, 1792. He early showed a fondness for the stage, though his father, a noted schoolmaster, entirely disapproved his inclination. At the age of thirteen, while employed in a counting-house, he published a weekly paper called *The Thespian Mirror*. Its merits being recognized a friend sent him as a student to Union College, and in February, 1809, made his first appearance as an actor in the Park Theatre, New York, in the character of "Young Norval." After visiting other American cities he appeared at Drury Lane Theatre, London, in June, 1813. For nearly twenty years he remained in England, being engaged as actor, manager, and playwright. Besides translating and adapting French plays he produced *Brutus* (1818), in which Edmund Kean took the title-role, and *Charles the Second*, which became a favorite with Charles Kemble. Another of his plays was *Thérèse, or the Orphan of Geneva*. His English opera, *Clari, the Maid of Milan*, contains the song which has become dear to all English-speaking people. In August, 1832, Payne returned to New York and engaged in minor literary and dramatic work. In 1841 he was appointed U. S. Consul at Tunis, but was recalled four years later. In 1851 he received the same appointment and went again to Tunis, where he died April 10, 1852. His grave in the British cemetery there was marked by a stone erected by one of his successors in office, but afterwards fell into neglect. Mr. W. W. Corcoran of Washington in 1883 caused his remains to be removed and brought to that city, where a suitable monument has been erected in Oak Hill Cemetery. See C. H. Brainard's *John Howard Payne* (1885).

PAYSON, EDWARD (1783-1837), a clergyman, was born at Rindge, N. H., July 25, 1783, being the son of Rev. Dr. S. Payson (1758-1820) and nephew of Rev. Dr. Phillips Payson (1736-1801). Edward graduated at Harvard College in 1803, spent three years in teaching at Portland, Maine, and was ordained to the ministry in 1807. He was the colleague of Rev. M. Kellogg until 1811, and thenceforward sole pastor. He was especially noted for his fervent piety and deeply religious character. He died Oct. 22, 1837. His *Sermons* were published in 3 volumes (1846), with a biography.

PAZ-SOLDAN, PEDRO, a Peruvian poet, was born at Lima, in May, 1839. He was brought up on his father's estate of Arona, from which he has taken his pseudonym, "Juan de Arona." In 1859 he went to Europe, and pursued literary studies at Madrid, Paris, and Rome. Before he returned, in 1863, he had published his first collection of poems, *Ruinas* (Paris, 1863). These were of very unequal merit, and reflected the various experiences by which he had been influenced. He served in various government offices in Lima, and was sometimes sent abroad in a diplomatic capacity. To the Peruvian journals he contributed numerous sketches of travels and manners, and several translations. His *Poesías Peruanas* (Lima, 1867) gives

graphic pictures of the people and scenery of his native land. *Chimpuza* is a little volume of sonnets and epigrams. Paz-Soldan has been elected a corresponding member of the Madrid Academy, and has published a *Diccionario de Peruanismos*, illustrating the variations of Peruvian speech from pure Castilian.

PEA. A leguminous garden plant, of the genus *Pisum*. The common pea, *Pisum sativum*, is a smooth and glaucous annual, p. 441 (p. 452 of from 6 inches to 6 feet high, according to the variety, with pinnate leaves, usually having two pairs of leaflets, the petiole terminating in a branching tendril, of use in the climbing habit of the plant. The flowers are white or purplish-violet in color, of the irregular form known as papilionaceous. The ovary is one-celled, the pod somewhat fleshy, containing several globose seeds, with very thick cotyledons. The native country of the pea, as in the case of many of our garden vegetables, is unknown. It was cultivated by the Greeks and Romans, but there is no proof that it was known earlier. It is now almost universally cultivated, and is everywhere a favorite esculent. The highest degree of perfection of the pea is attained under comparatively low temperatures, and the early spring sowings always produce the best results. It needs warm, light soils, moderately manured for early maturing, though for abundant crops a strong loam inclining to clay is best. For early crops it is sown in November, or at the first opening of the soil in February or March. The pea is ordinarily eaten in its green state, and "cannot be eaten too young, or too soon after gathering," as it rapidly deteriorates in healthfulness if kept too long. From this fact peas brought from a distance are apt to be flavorless and unwholesome.

The *P. arvense*, or field-pea, is probably derived from the same original species as the garden-pea. It is valuable not only for its seed but as a forage-plant, for which some varieties are specially adapted. There are perhaps more varieties of the pea than of any other garden vegetable, the varieties dividing into two very distinct classes: the common pea, of which only the unripe seeds are eaten, and the eatable podded, called the sugar-, skinless-, or string-pea, in which the pods are succulent, and are used in the same way as string-beans. This class is not much cultivated. Of the common pea there are two distinct kinds, some being smooth and yellowish-white when ripe, others wrinkled and greenish, and much larger. Ripe peas contain much nutriment, and in a dried state are largely exported from this country to England, where they are much more extensively used than here.

The pea is liable to a variety of enemies, of which the most distinctive are the mildew, which often produces serious injury, and the pea-weevil, a small beetle. (See AGRICULTURE, Chap. IX.) Many other varieties of pulse are called peas, as the chick-pea and the cow-pea (*Dolichos*) of the South, a valuable forage-plant, of great importance in Southern agriculture. Its seeds resemble those of the bean. The production of peas in America in 1880 was 6,514,977 bushels. (C. M.)

PEABODY, ANDREW PRESTON, educator and author, was born in Beverly, Mass., March 19, 1811. He graduated at Harvard College in 1826, studied theology, and became tutor in the college in 1832. In the next year he was ordained pastor of the South Congregational Church, Portsmouth, N. H. In 1860 he became preacher and Plummer-professor of Christian morals in Harvard College, and held this position until 1881. Throughout his career he was a diligent writer, and his published sermons, lectures, and pamphlets are numerous. For several years he was one of the editors of the *Christian Register*, and from 1852 to 1861 he edited the *North American Review*, discussing with ability and in animated style the social and educational questions of the time. Among his works are *Lectures on Christian Doctrine* (1844); *Sermons of*

Consolation (1847); *Christianity the Religion of Nature* (1864); *Reminiscences of European Travel* (1866); *Moral Philosophy* (1873); *Christianity and Science* (1874); *Christian Belief and Life* (1875); *Conversation* (1882); *Baccalaureate Sermons* (1885). He published also translations of Cicero's philosophical treatises and a volume of *Reminiscences* (1888).

PEABODY, ELIZABETH PALMER, whose life has been devoted to the cause of education, was born at Billerica, Mass., May 17, 1812. Her father was a physician, and her sister was married to Nathaniel Hawthorne (for whom see *ENCYCLOPEDIA BRITANNICA*). Miss Peabody spent her early life in Salem, but has resided chiefly in Boston. She assisted Mr. Bronson Alcott in his school, of which she has preserved an account in *Records of a School* (1833), a book revived in recent years. She was drawn also into the transcendental movement, and contributed to the *Dial*. Besides preparing various text-books she edited *Aesthetic Papers* (1849), and published *Crimes of the House of Austria* (1852), *Lectures on the Nursery and Kindergarten* (1874), and *Reminiscences of W. E. Channing* (1880). She was associated with Mrs. Horace Mann in writing *Moral Culture of Infancy* (1863), and translated into English De Gerando's *Self-Education* (1860). She has been one of the most vigorous advocates of the kindergarten system, and for several years she conducted a magazine in its behalf.

PEABODY, WILLIAM BOURN OLIVER (1799-1847), an American clergyman and author, was born at Exeter, N. H., July 9, 1799. He graduated at Harvard College in 1816, studied theology under Rev. Dr. Henry Ware, and was ordained, in 1820, pastor of the Unitarian Church at Springfield, Mass. He prepared for Sparks' *American Biography* the *Lives of Alexander Wilson, Cotton Mather, David Brainerd, and James Oglethorpe*. Having a fondness for natural history he frequently lectured on such subjects, and prepared for the State of Massachusetts a *Report on the Birds of the Commonwealth* (1839). He died at Springfield, May 28, 1847.

His twin-brother, OLIVER WILLIAM BOURN PEABODY, after graduating at Harvard, became a lawyer at Exeter, but removed to Boston in 1830, and was for several years an editor of the *Daily Advertiser*. After spending a year at Jefferson College, La., as professor of English literature, he became a Unitarian preacher in 1845. He undertook to publish his brother's literary remains, but before completing the task died at Burlington, Vt., July 5, 1848. He wrote for Sparks' *American Biography* the *Lives of Gens. Putnam and Sullivan*. His son, EVERETT PEABODY (1831-1862), who was killed at the battle of Shiloh, edited the works of both his father and uncle.

PEACH. The widely cultivated tree yielding this favorite fruit is a member of the See Vol. XVIII. *Rosaceæ*, or rose family. It was formerly called *Persica vulgaris*, but through its close affinities to the almond it afterwards received the name of *Amygdalus Persica*. More recently the peach, almond, apricot, plum, and cherry have been classed into one genus known as *Prunus*. It is now believed, indeed, that the peach, almond, and nectarine are identical in origin, the almond being the original form, the peach an improved or fleshy almond, and the nectarine a persistent sport of the peach. It was long believed that the peach originated in Persia, but De Candolle is of the opinion that it probably first appeared in China, and gradually migrated westward.

The peach is a tree of medium size, usually not over fifteen or twenty feet in height and rarely reaching thirty. It is regarded as short-lived, yet under proper conditions has been known to live for more than a century. It has a spreading head, with deep green leaves, long, narrowly lanceolate, and serrate. The flowers appear before the leaves and are of the

general structure of this section of the rose family. The calyx has a short, bell-shaped tube, with five spreading petals, usually of a rosy hue, the stamens numerous, pistil solitary, ovary containing two ovules, only one of which usually develops. The fruit is a drupe, or stone fruit, the outer portion becoming fleshy and when ripe very soft and succulent. The stone is a hard, nut-like body. The peaches are divided into two sections, known as clingstones and free-stones, in the first of which the flesh clings firmly to the stone, while in the second it readily separates and leaves the stone clean and dry.

The peach is readily injured by frosts and cannot be cultivated with profit in high latitudes. In middle and northern Europe it is raised against walls and in hothouses, but is produced as a standard tree only in the south. In the United States it cannot be raised profitably much beyond 40° north latitude. It was introduced into North America by the early European settlers, probably about 1700, and is now very extensively cultivated. This country, indeed, is the only one in which it is within the reach of the poorer classes, it being in Europe a luxury of the rich.

The peach reaches its highest perfection in the Middle States, its flavor not being so delicate when raised farther north, while in the South it is apt to grow greatly to foliage and wood, though with care fine large fruit may be produced. The peach area of the Middle States includes portions of New Jersey, Delaware, Maryland, and Pennsylvania, though Delaware

Peach-Gathering in Delaware.

and the Chesapeake counties of Maryland and Virginia are the most important sections of this region. Peaches are here produced in great abundance and of unsurpassed quality. The 1888 crop is estimated variously at from 6,000,000 to 10,000,000 baskets, an unprecedented yield. Formerly the large crops of this region were in considerable part wasted for want of a market, but an extension of the area of distribution and a great development of the processes of drying and canning have overcome this difficulty, and the largest crops can now be profitably disposed of.

Farther south in the Atlantic States the peach is raised only sufficiently to supply local needs, but the State of Georgia has a very large area devoted to peach orchards and produces some very fine fruit. The peach here ripens early and is safe from danger of frost. Some of the orchards contain 70,000 trees. Florida has also made peach-raising one of her industries. In the States of the Mississippi Valley the peach is largely cultivated. Texas is the first in the market, having ripe peaches by the first of June. Ohio, Illinois, and Missouri produce largely, while the lake shore of Michigan yields peaches abundantly, the temperature being modified by the presence of large bodies of water. In California immense crops of peaches are raised, and the cultivation is steadily increasing. The fruit there is said to be of excellent quality.

Many varieties of the peach are cultivated, and the season in the Middle States continues from late July to early October. It grows well in sandy, rather poor

soils, but the most abundant crops are obtained from land of moderate fertility. It will also prosper on clayey and calcareous soils, but too high manuring is injurious to the fruit. It bears early, sometimes in the second year after planting, but as a rule the orchard peach is short-lived. The tree has many enemies, the most destructive being a borer (*Egeria exitiosa*), which is difficult to handle. (See "Peach-tree Borer" under AGRICULTURE, Chap. IX.) The tree is also subject to a disease known as the "yellows," which attacks the leaves. These natural enemies in connection with the fact that the blossoms are very liable to injury by late frosts, render the peach-crop a very precarious one, yet it is sufficiently lucrative to overcome these disadvantages. (C. M.)

PEALE, CHARLES WILSON, (1741-1827), painter, was born at Chestertown, Md., April 17, 1741. After the death of his father, Rev. Charles Peale, in 1750, the family removed to Annapolis. Here Charles was apprenticed to a saddler and followed that trade for some years. But being attracted to portrait-painting, he obtained some instruction from Hesselius and afterward from Copley at Boston in 1768. Thence he went to London, studied painting under Benjamin West, and learned also engraving, miniature-painting, and wax-modelling. Returning to Maryland he executed many portraits, among them one of Washington in the uniform of a Virginia colonel. In 1776 he went to Philadelphia and as captain of volunteers fought at Trenton and Germantown. In 1779 he was elected to the Pennsylvania Legislature. For fifteen years he was the only portrait-painter of note in North America. His portraits of the prominent revolutionary officers were the chief attraction in the picture-gallery which he afterwards formed. This was indeed but an adjunct to a museum of natural history, which he opened at Philadelphia in 1802, being incited thereto by the discovery of a fossil mammoth in Ulster co., N. Y. After various ineffectual efforts, from 1791 on, he assisted in founding the Pennsylvania Academy of Fine Arts, to whose exhibitions he contributed for seventeen years. He was noted for his mechanical ingenuity and was the first American to manufacture artificial teeth. He published some essays on bridges, health, and other topics. He painted fourteen portraits of Washington, the last in 1793. His last work, now in the Philadelphia Academy, was a full-length portrait of himself at the age of 83. He died at Philadelphia, Feb. 22, 1827. He had been thrice married.

His son, REMBRANDT PEALE (1778-1860), also a painter, was born in Bucks co., Pa., Feb. 22, 1778, and was trained by his father. He painted a portrait of Washington in 1795, and practised his art in Charleston, S. C. In 1801 he went to Europe, studied under West in London, and while in Paris painted many portraits of distinguished persons for his father's museum. After his return in 1809 he was busily engaged as a portrait-painter. He also executed the large pictures of The Roman Daughter and The Court of Death, which were exhibited in several cities. He published a *Biography of his father*; *Notes on Italy* (1831); *Portfolio of an Artist* (1839); *Reminiscences of Art and Artists*. In 1859 he lectured in several cities on the portraits of Washington. He died at Philadelphia, Oct. 3, 1860. Peale's Museum, which from an extensive addition of Chinese curiosities came to be called the Chinese Museum, was destroyed by fire in 1851. Several other members of the Peale family devoted themselves to art.

PEANUT, *Arachis hypogaea*, the pea, ground, or earth nut, is a herbaceous annual, of the pulse family, of the natural order *Leguminosae*. It has a branching stem nine to eighteen inches high, with hairy pinnate leaves, having four broad, blunt leaflets in pairs. The flowers are papilionaceous, of yellow color, and produced singly in the axils of the leaves. This plant has the peculiar habit, after the decay of the petals of

the lower blossoms which alone bear fruit, of bending downward the flower-stalk and insinuating the ovary into the earth to the depth of several inches. Here the fruit develops and ripens. The seeds are borne in an oblong pod 1 to 1½ inch long, contracted in the middle, and with a reticulated surface of yellowish color. It contains ordinarily two seeds, of irregular ovoid form, with thick cotyledons and a straight radicle.

This plant is a native of Africa or South America. It was not known till the discovery of America, but seems equally prolific in both countries. It is now

Peanuts.

cultivated throughout the tropics and to a considerable extent in the temperate regions of North America, its large, sweet, pleasant-tasted seeds being widely used as food. It succeeds best in a warm, light, loamy soil, deeply plowed and well pulverized, and yields a quick and abundant return, fifty bushels per acre being produced in good, well-cultivated soil. It is generally grown in Brazil, the West Indies, India, and parts of Africa, and in several of the Atlantic States of America, its tropical character hindering its successful culture in the Northern and Middle States. The plant is killed by the first frost, the nuts then maturing. The peanut was formerly largely imported into the United States, but a sufficient supply is now yielded by Virginia and the Carolinas. The use of the seeds as food is very considerable, New York city alone absorbing more than half a million bushels annually. They are very nutritious and form an important addition to the food-supply of the world.

The seeds contain much oil, yielding under pressure over 20 per cent. of a fixed, non-drying oil, which is said to be in no way inferior to olive oil for table use. It is used principally as a lubricant and in soap manufacture, and to some extent in woollen-factories for cloth-dressing. In lamps it is better than sperm oil, but thickens in cold weather. (See OILS.) In addition to these uses the peanut is also a good fodder-plant. The vines and leaves somewhat resemble clover. When ripe the vines are pulled from the ground, the nuts adhering tenaciously and requiring to be removed by hand. (C. M.)

PEAR, *Pyrus communis*, is a near relative botanically of the apple, and the fruit, while quite distinct in sensible qualities, is closely similar to the apple in botanical characters. The flowers are of the type of the *Rosaceae*, to which family the pear belongs, and are pure white in color, with purple anthers. The fruit

See Vol. XVIII.
p. 445 (p. 456
Am. Rep.)

generally tapers towards the stem, the base of which is not sunk in a cavity, as in the apple. The tree is ordinarily about 20 feet high, but has been known to grow as high as 60 feet. By a dwarfing process of grafting much smaller trees, known as dwarf pears, are produced. The wood is very hard and close-grained, and, dyed black, has been used as a substitute for ebony. The fruit has not the firmness of the apple, but is sugary and melting, with hard concretions near the core composed of indurated cells.

The pear is a native of temperate Europe and the Caucasus, and was cultivated at an early date, many varieties being known in Pliny's time. At the present day more than 3000 varieties are enumerated in the catalogues, though of course very few of these are in practical cultivation. It is a long-lived tree, one specimen in England being about 400 years old. One in New York planted by Peter Stuyvesant in 1648 was still bearing fruit 200 years afterward. It is cultivated as a standard tree, by grafting on pear seedlings, and as a dwarf, by using the thorn, mountain ash, or quince as a stock for grafting. The quince is generally used.

The pear needs a strong, dry soil, and is subject to many insect enemies, which attack the leaves and bark. Its worst foe, however, is the "blight," which is probably produced by a minute fungus, which rapidly spreads and is destructive to branch and tree alike if not quickly eradicated.

Of pears grown for sale only a few of the many varieties are widely cultivated. A general favorite among these is the Bartlett, which is notable for its size, lusciousness, and abundant bearing. It is estimated that 90 per cent. of the pears grown for profit in the United States are of this variety. Another favorite is the Seckel, a small fruit, but of unsurpassed flavor. This is traced to a single tree in the suburbs of Philadelphia. As a rule pears are better if picked when just mature and ripened in the house. Many varieties which are excellent thus ripened are worthless if left to ripen on the tree.

The pear has a wide range of distribution. Unlike the apple and the peach, it flourishes in the sea-coast country of the South Atlantic, while it is equally at home in the highlands of the interior. The three States in which it is most largely produced are Georgia, Florida, and California. The latter seems particularly adapted to its culture, and produces it in vast quantities and of extraordinary size. Very many of these pears are shipped to the East, while great quantities are preserved by canning, a process to which the pears lend itself excellently, retaining much of its original flavor. (C. M.)

PEAT is found in the United States towards the northern border from New England to Dakota, but more extensively in Canada and Newfoundland. It consists of partially decomposed vegetation, and forms only in cold, moist climates. As fuel it has never attained any prominence in America, though it is so used throughout Northern Europe, where several varieties, distinguished partly by color, are known. The best is the dark-brown or black, which is the most free from earthy matter. This mineral matter varies greatly; some peats, when burnt, leave chiefly carbonate of lime, others the sulphate, while silica, phosphates, etc., also occur.

PECAN, *Carya olivæformis*, is a tree belonging to the walnut family (*Juglandaceæ*) and to the hickory genus, of the several species of which it produces the most palatable fruit. It is a handsome, lofty, North American tree, growing to a height of 70 feet, with a slender, straight trunk, and compound leaves with petioles 12 to 18 inches long, with 13 to 15 sessile leaflets. It is found on river banks from Illinois southward to Mississippi, and will bear in gardens and sheltered places as far north as the banks of the Hudson. It was introduced into France many years ago. The pecan is the most rapidly growing of the hickories, and yields a coarse-grained but heavy and durable

wood, which is stronger and more elastic than the white ash. Its bark, as in all the hickories, contains yellow dye principles, from which an olive dye may be made by the addition of copperas, and a green by the addition of alum.

The pecan tree is particularly esteemed for its fruit, which is the most delicious of all the hickory nuts. It is sweet and of an agreeable flavor, and has a thin, easily broken, yellowish-brown shell, without the internal partitions of the ordinary hickory nut. The pecan is raised extensively for commercial purposes in the Southern States, Texas alone exporting annually over \$50,000 worth of its nuts.

PECK, WILLIAM DANDRIDGE (1763-1822), entomologist, was born in Boston, graduated at Harvard College in 1782, and became professor of natural history there in 1805. He published a catalogue of *American and Foreign Plants* in 1818. For his other work see AGRICULTURE, Chap. IX, at end.

PEDRO II., DE ALCANTARA, DOM, Emperor of Brazil, was born at Rio de Janeiro, Dec. 2, 1825. He was the son of Dom Pedro I. and of Leopoldina, archduchess of Austria. His father had renounced the throne of Portugal in 1826 in favor of his infant daughter, Donna Maria de Gloria, and in 1831, weary of the struggle with the revolutionary tendency of the Brazilians, abdicated in favor of his son, then five years old. He had appointed Andrada e Silva, the exiled chief of the democratic party, tutor of the child. The tutor accepted the position in good faith, but two years later was driven from the palace by a mob. A council of regency then administered the government until July, 1840, when Pedro II. was declared of age, though not yet fifteen years old. The country still suffered from agitation, and in 1842 a dangerous insurrection was quelled by Gen. Caxias. Thenceforth the internal peace of the empire was not disturbed. In 1843 Dom Pedro was married to the Princess Theresa Christina Maria, daughter of Francis I., King of Naples. Of their four children, only one daughter still lives. She was married in 1864 to the Comte d'Eu, grandson of Louis Philippe, of France, and has three sons.

The emperor is remarkably well educated, and converses fluently in English, French, German, Spanish, Italian. Well versed in science and literature, he is liberal in promoting them in his dominions. In 1852 he assisted in the overthrow of the dictator Rosas in the Argentine Republic, and thereby acquired for Brazil an enlargement of territory and the free navigation of the Rio de la Plata. In 1860 he made extensive travels in all parts of his dominions. In 1865 Brazil, Uruguay, and Argentine Republic were compelled to unite in repressing the wild ambition of Lopez, the dictator of Paraguay. The war was only ended by the death of the savage dictator in 1870. A complication with the Argentine Republic ensued, but the matter was finally compromised in October, 1872. Meantime Dom Pedro had visited Paris, giving special attention to its scientific institutions. He also travelled in Spain, and in 1876 he made a tour in the United States and then visited Europe again. Everywhere he left the most favorable impressions of his courtesy, energy, scientific zeal, and public spirit. His reign has been signalized by the abolition of slavery. In 1831 the African slave-trade was prohibited, but practically it did not cease till 1853. Still more important was the decree for the abolition of slavery, issued Aug. 25, 1871. By its terms all slaves on the imperial estates were at once emancipated, and all the children of slaves of private owners, born thereafter, were declared free.

PEEL, ARTHUR WELLESLEY, Speaker of the British House of Commons, was born in 1829, being the youngest son of the famous Sir Robert Peel. He was educated at Eton and at Balliol College, Oxford, and entered Parliament in 1865 as member for Warwick, which he still represents. He was parliamentary secretary to the Poor Law board in 1868-71; secretary of

the Board of Trade in 1871-73; patronage-secretary of the treasury, 1873-74; under-secretary of the home department in 1880. He was chosen Speaker of the House in 1884 on the retirement of Sir Henry Brand, and was re-elected in 1886.

PEET, HARVEY PRINDLE (1794-1873), educator of deaf-mutes, was born at Bethlehem, Conn., Nov. 19, 1794. He graduated at Yale College in 1822 and became an instructor in the Hartford asylum for the deaf and dumb. His noble work there has been described under DEAF-MUTES. He died at New York city, Jan. 1, 1873. He published a useful *Course of Instruction for the Deaf and Dumb* (1844-46); *Legal Rights of the Deaf and Dumb* (1856); and other works connected with the cause to which he had devoted his life.

His son, ISAAC LEWIS PEET, was born at Hartford, in Dec. 4, 1824, graduated at Yale College in 1845, and at Union Theological Seminary in 1849. He and his brother EDWARD (1826-1862) followed in the footsteps of their father, and contributed to the literature pertaining to deaf-mutes.

PEKIN, city of Illinois, county-seat of Tazewell co., is on the left bank of the Illinois River, 10 miles below Peoria, and 163 miles S. W. of Chicago. Four railroads pass through the city. It has a court-house, 5 hotels, 2 national banks, 1 other bank, 2 daily and 5 weekly newspapers, 12 churches, and 6 schools. The industrial works comprise 2 foundries, flouring-mills, wagon-, plow-, and organ-factories, and 2 header-works. Pekin was settled in 1831, and incorporated in 1849. It has gas- and water-works, and a park. Its property is valued at \$1,250,000, the public debt is \$75,000, and the yearly expenses about \$45,000. Its population in 1880 was 5993.

PEMBERTON, JOHN CLIFFORD (1817-1881), Confederate general, was born in Philadelphia in 1817. He was descended from Phineas Pemberton, who came from England with William Penn, and whose family was prominent in Philadelphia in the eighteenth century. John graduated at West Point in 1837, served in the Florida and Mexican wars, being aide-de-camp to Gen. Worth in the latter. At the outbreak of the civil war he resigned his captain's commission and entered the Confederate service as colonel of cavalry and assistant adjutant-general to Gen. Joseph E. Johnston. In 1862 he was made brigadier-general, and then lieutenant-general, having command of the army in Mississippi. He was intrusted with the defence of Vicksburg when Grant began his campaign to recover the free navigation of the Mississippi. Pemberton was defeated at Champion Hills, May 16, 1863, in his attempt to keep open the way for reinforcement by Johnston's army. Thenceforth he was shut up in the fortifications of Vicksburg until July 4, 1863, when he was compelled to surrender to Gen. Grant. Being exchanged he resigned his command, but at the close of the war he was inspector of artillery at Charleston. Thereafter he lived in retirement in Virginia. He died at Philadelphia, July 13, 1881.

PEN. The history of the manufacture of steel pens in the United States covers a period of about thirty-five years. In June, 1853, William Gilchrist started his factory, which was located about 2 miles from Suffern's Depot, N. J., on the Erie Railroad, the power being furnished by water from the Ramapo Creek. This business was conducted successfully until November of the same year, when the factory was totally destroyed by fire. James Bishop, of Newark, N. J., purchased the salvage, and continued the business for a short period, when it was sold to a stock company known as the Newark Steel Pen Co. This concern did not prosper, but labor troubles arose, and owing to disagreements between the company and its employes, the company failed and the business passed into the hands of the Franklin Pen Co. of New York, a newly organized house. In 1855 the

American Steel Pen Co. began business in New York. Afterwards under the title of Washington Medallion Pen Co. this organization conducted the business until 1861, when Harrison & Bradford, of New York, purchased the plant. This firm continued the business for twenty years, and was really the first house to put the American manufacture of steel pens on a solid foundation. In 1881 this firm went out of business, Mr. Harrison becoming a member of the firm of Turner & Harrison, of Philadelphia, while Mr. Bradford became connected with the Miller Bros. Cutlery Co., of Meriden, Conn. This house at that time began to make steel pens, Mr. Bradford being placed in control of the new department. In 1860 the Esterbrook Steel Pen Co. entered the field as manufacturers of steel pens, with an extensive factory at Camden, N. J., and this house is to-day the largest American maker.

These three houses, the Esterbrook Steel Pen Co., the Miller Bros. Cutlery Co., and Turner & Harrison, are now the only manufacturers of steel pens in the United States, and their combined annual output is about 1,500,000 gross, while of foreign pens the annual importation is about 600,000 gross.

The raw material used by these manufacturers is a fine crucible steel, produced in Birmingham, England, which is imported here both rolled and in the rough. When rolled it is in strips about 4 ft. long and 3 to 3½ in. wide.

The process of manufacture has changed but little all these years. The work is mainly hand labor, and whatever improvements have been made have been in the way of "raising" the pen and changing the side slits so as to secure greater flexibility. Each pen, in its progress from the blank to the finished article, is handled from 22 to 24 times, and in the case of some special pens the operations exceed these numbers. First, the pen blank is struck out of the rolled steel, after which it is "pierced" or has cut in it the little hole which is in the body of the pen, just above the slit in the point. It is then annealed and stamped either with the maker's or an "imprint" name. It is next "raised;" that is, it is rounded up and given its proper shape. It is then hardened and tempered, in which are included a number of operations. After this it is ground lengthwise to allow the ink to run to the point, and then cross-ground to hold the ink at the point and prevent it from dropping off. After the pen is scoured, the slits are cut in the point and sides, and the former of these is perhaps the most delicate of all the manipulations through which the pen passes. The finished pens are then assorted, each pen being examined, weighed into boxes, each containing a gross, and packed into cartons, each carton containing 25 gross.

In the early days of steel pens the demand was almost wholly for those with fine points, but with the necessity for rapid and easy writing came the call for the various grades of blunt, turned-up, round-pointed, and stub pens, until now some houses show a variety of 250 different styles. "Imprint" pens are those which have stamped upon them the name of the jobbing or retail stationer instead of the name of the maker. Formerly a large variety of "imprints" were made, and, while now the quantity has increased, the stamps are mostly confined to jobbers and retailers doing an extensive business.

Gold Pens.—The manufacture of gold pens in the United States dates from the spring of 1836, when Simon Hyde, an enterprising American, purchased the business of John Isaac Hawkins, an Englishman, who after years of patient study and experiment had succeeded in making a gold pen. Hyde bought the business for £300, and a royalty on all pens sold. Hawkins had taken out no patent, and for several years the process of manufacture was kept a profound secret by Hyde and his assistants. It finally leaked out and by 1849 there were fifteen firms engaged in the business, and from that time on rapid progress was made, the trade reaching its zenith about 1861, since which time

it has remained at about the same level. The gold pen to-day is practically the same as when Hawkins completed it, except that the goods are now made in a neater and more finely finished manner.

Fountain Pens.—In 1848 N. A. Prince, of New York, brought out the first fountain pen. This consisted of a metal barrel tapering to a point at the upper end; the lower end was round, the under side of the barrel being cut away, exposing to view and for use a small curved bit of rubber which was the writing point. A valve located just above the pen controlled the ink, and was opened or closed at pleasure. As soon as Goodyear produced his vulcanized rubber, Mr. Prince and his partner, John S. Purdy, secured the exclusive right to use that rubber for pen barrels. Since that time inventors innumerable have taken out patents on fountain pens, the result being that the market is now supplied with a great variety of styles. The general characteristics of all the pens are about the same, the variations being mainly in the methods employed to feed the ink to the pen.

The origin of the stylographic pen is obscure. It seems to have been developed by some one who was working to produce a fountain pen, and it is hard to distinguish between early specimens of the two instruments. The earliest record of a stylographic pen is the granting of a patent for one to Charles W. Krebs, of Baltimore, Md., in 1850. The pen was a crude affair. Six years later Nelson B. Slayton, of Madison, Ind., invented and patented a stylographic pen, but in 1869 one Kenyon invented a pen which was about the first bearing a resemblance in mechanical construction to those which followed and became popular. Inventors in this branch appear to be as numerous as in fountain pens, but the pens brought out of late years have a general similarity. (C. K. U.)

PENALTY, as a legal term, is used in two ways: 1. It denotes a clause in an agreement by which the obligor agrees to pay a certain sum of money if he shall fail to fulfil the contract contained in another clause of the same agreement. The most ordinary form of penalty is that named in a bond: it was originally inserted according to Blackstone to evade the prohibitions against taking interest for money, and was considered as part of the real debt. Penalties were then strictly enforced and continued to be so until courts of equity interfered and held that, upon the principle that compensation and not forfeiture was the just and equitable rule to be applied to all cases, they would grant the obligor relief when he had been prevented from paying the money on the day stipulated. Consequently, when the debtor paid the debt, with interest for its detention and costs, he should not be mulcted in further damages. Acts of Parliament were afterwards passed giving the courts of common law power to afford the same relief. These or similar statutes are in force generally in the United States.

There is frequently a question whether the sum named is a penalty or the amount of damages which the parties have agreed shall be recovered, in case of a breach of covenant. Against such stipulated or liquidated damages equity will not relieve. The general rule has been said to be that "when the injury is susceptible of definite admeasurement, as in all cases where the breach consists in the non-payment of money, the parties will not be allowed to make a stipulation for a greater amount, whether in the form of a penalty or of liquidated damages. But when, on the other hand, the injury in question is uncertain in itself and unsusceptible of being reduced to certainty by a legal computation, it may be settled beforehand by special agreement." In all cases it is a question of intention.

It has been held that a penalty remains unaffected though the condition may have been partially performed, as where the penalty was \$1000 and the condition to pay an annuity of \$100, which had been paid for ten years; the penalty was still valid.

2. Penalty is also the term used for the punishment inflicted by a law for its violation; a pecuniary punishment is generally meant, though the phrase "death-penalty" is also in common use. (T. R.)

PENCIL. This article is confined to the manufacture of lead pencils in America. M. L. Leman, of New York, was the pioneer manufacturer of lead pencils in the United States. He began the business in 1830, and his workmen were distributed in Jersey City, Hoboken, and other places adjacent to New York. The old system of all handwork was then in full force, the workmen taking the pencils home to "finish," the making of the pencil in the rough being carried on at a central place.

In 1849 Eberhard Faber came to New York as the agent of A. W. Faber, of Stein, Germany, and in 1861, the centennial of the house, it was determined to found the industry in America. This was done, the plant being located in New York city, but in 1872 the factory was burned down and a new one was built at Greenpoint, L. I. This move of Faber was really the start of the pencil industry in this country. In 1865 the Eagle Pencil Co. began the manufacture of pencils in America, all their goods before that time having been imported. In 1865 the American Lead Pencil Co. entered the field, and was followed in 1872 by the Dixon Crucible Co., and to-day these are the only makers in the United States.

With the exception of the American graphite used by the last-named company all of the pencil lead used in this country comes from abroad, the chief mines being in Bohemia, although one maker has the output of the Alibert mine, Siberia, which is used in certain grades of artists' pencils. The clay which is mixed with the lead to give it a proper texture comes from Bavaria and Bohemia, the finer grade being from the former place. The clay is of a brownish color and possesses fatty qualities, being oily or greasy when rolled in the fingers. The wood used in the great majority of grades is cedar and the supply of that wood used by all pencil-makers the world over comes from Florida. Other woods are used to a slight extent, but none of them work so well under the knife when sharpening the pencil as the cedar. The American inventive genius has been shown in this industry as in others, and while the laborer in Europe produces one pencil at a time the American machine produces six, and in the subsequent finishing of the pencil hand-labor is reduced to a minimum. The lead pencil of to-day is practically the same as when first produced in 1565 in England. It is made neater, finished better, but is essentially the same. (C. K. U.)

PENDER, WILLIAM DAVIDSON (1834-1863), a Confederate general, was born in North Carolina, and graduated at West Point in 1854. He entered the artillery, but was soon transferred to the dragoons and was employed in frontier service until the secession of North Carolina, when he entered the Confederate service as colonel. He was afterwards promoted to be brigadier-general and major-general (May 20, 1863). He had command of a division at the battle of Gettysburg, and was killed there, July 3, 1863.

PENDLETON, EDMUND (1721-1803), a Virginia patriot, was born in Caroline co., Va., Sept. 9, 1721. He was of English descent, and early engaged in the practice of law. In 1752 he was elected to the House of Burgesses and was prominent in the patriotic movements preceding the Revolution. In 1774 he was a member of the first Continental Congress, and he presided in the Virginia Conventions of December, 1775, and May, 1776. He drafted the resolutions instructing the delegates of Virginia to propose in Congress a declaration of independence. During the war he was chairman of the Virginia Committee of Safety, and when the State was organized he was made speaker of the House. He also presided over the State convention which ratified the Federal Constitution, and strongly

supported this document against the objections of Patrick Henry. From 1779 till his death, Oct. 23, 1803, he was president of the Court of Appeals.

PENDLETON, GEORGE HENRY, statesman, was born at Cincinnati, July 19, 1825. His grandfather, Maj. Nathaniel Pendleton, had been aide to Gen. Greene, in the revolutionary war, and afterwards judge in New York. His father, Nathaniel Greene Pendleton (1793-1861), likewise had been aide to Gen. Gaines in the war of 1812, and member of Congress from Ohio, 1840-42. George was educated partly in Europe and became a lawyer. He was elected to the Ohio State senate in 1854, and passed thence to Congress in 1855, where he continued as a pro-slavery Democrat until the outbreak of the war. Then he was defeated for re-election, but returned in 1863, and opposed the prosecution of the war. In 1864 he was the Democratic candidate for vice-president, on the ticket with Gen. McClellan, but was defeated. Soon after the close of the war he became the most prominent advocate of the proposal to pay the U. S. bonds in "greenbacks," and as such was strongly pressed upon the Democratic convention of 1868 as a candidate for the presidency, but this movement failed. In the next year he was candidate for the governorship of Ohio, but was defeated. In 1879 he was elected to the U. S. Senate, where he was an able advocate of civil service reform. On the expiration of his term in 1885 he was appointed U. S. minister to Germany.

PENINSULAR CAMPAIGN, McCLELLAN'S.—After the disastrous defeat of Gen. McDowell, at Bull Run, July 21, 1861 (see BULL RUN), Gen. George B. McClellan, who had distinguished himself in West Virginia, was called to Washington and put in command of the troops collected there for the defence of the national capital. He found there 50,000 men, mainly newly levied or demoralized. Two things were clear to him. A large army must be created, and Washington must be fortified to set at rest apprehensions for its safety. These objects were not accomplished till the spring of 1862, and, meanwhile, on Gen. Scott's retirement on Nov. 1, 1861, Gen. McClellan had been made commander-in-chief of the forces of the Union. In the early spring of 1862 McClellan had under his immediate command 180,000 men organized into four corps, under the name of the Army of the Potomac. The enemy threatening the capital numbered 75,000, under Gen. Joseph E. Johnston, whose head-quarters were at Manassas Junction. His right wing rested on Aquia Creek and supported the batteries that blocked the Potomac. McClellan's first plan was to draw Johnston from his lines by transporting the Army of the Potomac to Urbanna, on the Lower Rappahannock, and moving it thence on Richmond. If he failed to carry Richmond by a *coup de main*, his ulterior purpose was to march to the James, and with that river as a base to assault the city in the rear. This, he conceived, by compelling Johnston to fall back on Richmond, would secure the capital, relieve the blockade of the Potomac, and open the communication between Washington and the West, now interrupted at Harper's Ferry.

Unfortunately the government had no longer unlimited confidence in its commander, and a positive order required him, before moving from Washington, to open the Baltimore and Ohio Railroad and destroy the batteries on the Potomac. The first of these objects he effected in the end of February, and almost immediately on his return to Washington intelligence reached of Johnston's abandonment of Manassas for the Rapidan. Thus the Potomac was freed, while the operations of the Monitor, near the mouth of Chesapeake Bay, enabled McClellan to look more confidently to the James River as a base.

Johnston's move southwards deprived the Urbanna scheme of its promise, for he could now reach Richmond before the Union army. The alternative was to adopt Fortress Monroe as a base, and, on March 17,

the leading divisions of what was meant to be an army of 155,000 were embarked at Alexandria. Precisely at this time McClellan was deprived of the command-in-chief, while his army by the withdrawal of troops for the defence of Washington was reduced to 120,000. On April 2d he reached the fort and found 58,000 men and 100 guns disembarked and ready to march, and at once took steps to advance up the Peninsula.

On April 1, 1862, the status of the army was as follows:

Second corps—Sumner.....	26,778
Third corps—Heintzelman.....	33,047
Fourth corps—Keyes.....	32,924
Regulars—Sykes and Cooke.....	5,906
Reserve artillery.....	2,731
Different corps.....	900
Sick.....	6,453
Absent.....	10,616

119,965

The disembarkation was completed on April 6th, when there were slightly over 100,000 men, with 44 batteries on the Peninsula, fit for service.

Fortress Monroe is 72 miles in a direct line S. E. of Richmond. The field of operations lay between this and the Upper Chickahominy on the north, and between the James River on the S. W. and the York and its main branch, the Pamunkey, on the N. E. The region divides itself into two parts—the Peninsula proper between the York and the James as far up as City Point, and the tract between the Pamunkey and James stretching above Richmond. In the former the land is flat, marshy, and thickly wooded. The second is undulating and divided longitudinally by the Chickahominy. The James was blocked by the Confederate iron-clad Virginia, formerly called the Merrimac; the York and Pamunkey could be ascended by vessels as far as White House, but the entrance was blocked by the guns of Yorktown. Hence the importance of this place. The secondary peninsula on which it stands is narrowed by a swampy stream, Warwick Creek, that rising about 1½ mile from the town empties perpendicularly into the James. Here nature marked out the Confederate true line of defence. Yorktown is 20 miles N. W. of Fortress Monroe, and Williamsburg 10 miles farther in the same direction.

On the 4th McClellan put his troops in motion, and his right appeared before Yorktown next day. His left was detained by the unforeseen obstacle of Warwick Creek, incorrectly laid down on the maps, along which was Magruder's line of defence extending 12 miles in length. His force of 11,000 men was evidently too small to hold a line of this length against the powerful army of his antagonist, and the fortifications of Yorktown were insufficient. Johnston urged evacuation and the concentration of all the forces in Richmond. To this Magruder would not listen. His obstinacy led McClellan to believe that he had been reinforced by part of the force from Manassas, and he deemed it prudent to wait for McDowell's 3 divisions, which had been promised him. On the very evening he was reconnoitring he was apprised that this whole corps was withdrawn from him and that Wool, who held Fortress Monroe with 15,000 men, had been made independent. The naval force on which he had relied for co-operation on the York failed him on the pretext of watching the Virginia. He hesitated and delayed, while Johnston sent part of his forces to help Magruder, following ultimately in person. When, therefore, after 11 days, McClellan decided to attack, Magruder's force was doubled. Yet the disproportion was not materially affected. The men embarked at Alexandria were now all in the Peninsula, and Franklin's division of McDowell's corps was restored to him.

On April 16th a general cannonade was opened and an attempt made to storm the breastworks. This resulted in failure and McClellan determined to proceed by regular siege. On May 5th everything was ready

for the bombardment, when it was discovered the foe had disappeared. Yorktown had been evacuated on the night of the 4th of May, in accordance with the decision of a council of war, in which Davis, Lee, Johnston, and Magruder took part. Seventy-one guns were the trophies abandoned to the Union army.

In evacuating Yorktown the Confederates abandoned York River, and Franklin's command was taken on board transports to be landed at White House, at the head of the navigation of the Pamunkey. McClellan conducted the pursuit by land. The task of covering the Confederate retreat was intrusted to Longstreet, under whom it was conducted with the greatest order. At Williamsburg defensive works had been constructed, the most prominent being a large work named Fort Magruder, nearly 2 miles in advance of the town. This and the chain of adjoining works were occupied by the Confederates, who saluted the on-pressing columns as they appeared on the edge of the forest with a fierce fire. The appearance of the numerous works was a surprise to the Unionists. Longstreet had manned them during the night, resolved to maintain possession. Hooker attacked his right, and Longstreet's artillery crossed its fire with that of the Confederate infantry. The Unionists in the open unable to withstand the cross-fire ambushed themselves among the abatis which became the scene of a fierce struggle. Hooker lost the abatis and was falling back when Kearney came to his aid. Allowing Hooker to pass between his battalions he took up the fight, and arrived in time to rescue one or two abandoned batteries. Towards 4 o'clock the right came into action, and Hancock, finding a small redoubt—a link in the Magruder chain—unoccupied, took possession of it, and his men pressed on till they arrived in view of the Confederate left. Longstreet, on discovering Hancock, despatched Early's brigade against him, but this was driven back in disorder. McClellan, who had remained behind to see Franklin off, arrived before Williamsburg too late for further action that night. He saw that the Confederate defences were turned and prepared for a vigorous assault on the morrow, but Johnston, conscious of his numerical inferiority, evacuated his defences and during the night resumed his retreat. The Confederates had 3000 men disabled, and left 600 prisoners. The Union loss was 2073 killed and wounded and 623 prisoners.

Franklin's division, which had embarked on the evening of the 5th, arrived at Elkhorn near White House on the 6th, but, on attempting to advance on the 7th, he was confronted by Whiting's Confederate division and Hood's brigade. This served to hold him in check, and Johnston reached Richmond without further molestation.

On the retreat of the Confederates from Williamsburg the Army of the Potomac was pushed forward as rapidly as the horrible condition of the roads would permit and on May 16th its leading divisions reached the White House, whence the West Point Railroad runs west to Richmond, 18 miles. Here McClellan established his depots, and by the 21st had his army established in echelon along the left bank of the Chickahominy. Johnston, meanwhile, had pressed forward the concentration of all available Confederate forces at Richmond, and had in consequence been joined by Huger with 11,000 men from Norfolk. Huger's abandonment of Norfolk led the Confederate Commodore Tatnall to blow up the Merrimac, thus leaving the James open to the Union gun-boats. McClellan was thus confirmed in his ulterior purpose of transferring his base to the James, and co-operating with Goldsborough in an attack on Richmond on the south. This purpose he would have carried out on the evacuation of Williamsburg but for an object to which high importance was attached, viz.: the insurance of a juncture with McDowell when he should move from Fredericksburg. With this object, as well as for the preservation of his communication with the White

House, he had to leave his centre and right wing on the north bank of the Chickahominy, when he on the 20th commenced to cross the rest of his army at Bottom's Bridge. At this moment McDowell's movement had really commenced, and Porter had marched to meet him as far as Hanover Court-House (where he had a combat and captured 700 prisoners and a gun), when Jackson's irruption into the Shenandoah alarmed the authorities for Washington and led to McDowell being countermanded, with his 41,000 men.

The ground of McClellan's immediate operations may be described in a few words. It presents but one obstacle, the Chickahominy, rising to the north of Richmond. In its downward course we meet first Meadow Bridge (over which passes the Gordonsville Railroad); below this is Mechanicsville Bridge, within 5 miles of the city; then New Bridge, connecting the hamlet of Old Tavern with Gaines' Mill heights; 6½ miles below this is the bridge of the West Point Railroad, and two-thirds of a mile farther down, Bottom's Bridge, 12 miles from Richmond. Here McClellan had crossed his left wing. The noticeable tributaries of the Chickahominy are Beaver-Dam Creek between Mechanicsville and Gaines' Mill on the left bank, White Oak Creek, giving rise to a vast wooded swamp, called White Oak Swamp, some 3 miles below Bottom's Bridge.

On the 28th McClellan had his left wing (Keyes and Heintzelman) on the south bank stretching from White Oak Swamp up to the railroad bridge; Sumner at the centre stood prepared to cross but his bridges were not laid; the right wing under Franklin and Porter stretched northward on the left bank as far as opposite Richmond. His whole line formed a semi-circle, broken near the centre by the Chickahominy and with the extremities 25 miles apart. The Confederates occupied the chord. Johnston was not the man to let slip an opportunity so full of promise for an attack, and accordingly on the 31st delivered an assault at Fair Oaks Station. (See FAIR OAKS, BATTLE OF.) Johnston's serious wound in this action led to the appointment of Gen. Robert E. Lee to the Confederate command-in-chief.

The battle of Fair Oaks (during which Sumner had crossed to the south side) was followed by storms, lasting till June 20th, that enforced rest on both combatants. The only events calling for note were Stuart's cavalry reconnoissance round the whole rear of the Federal line with his raid on the railroad and White House, and the transfer of Franklin's corps on the 19th to the south bank, Porter, reinforced by McCall, being left alone north of the river.

By June 26th the ground was dry enough to admit of operations. Lee supposed that McClellan's object in bringing his forces across the Chickahominy was to lay regular siege to Richmond. His cadres had now been filled up by the enforcement of the conscription in the South and by further reinforcements, and he proposed to raise the siege by threatening the Union line of communication with White House. The armies by which the aims of either general were to be executed were nearly equal, numbering each a little over 100,000 men present for duty.

The following is a summary of the effective strength of the two armies on June 26, 1862:

Union.		Confederate.	
Sumner,	17,581	A. P. Hill,	14,000
Heintzelman,	18,810	D. H. Hill,	10,000
Keyes,	14,610	Longstreet,	10,000
Porter,	19,960	Magruder,	13,000
Franklin,	19,405	Huger,	11,000
McCall,	9,514	Holmes,	7,000
Staff, Engineers,		Jackson,	30,000
Cavalry, etc.,	4,844	Pendleton's Art'y,	1,500
		Stuart's Cavalry,	4,000
	104,724		
Deduct losses since			100,500
June 20, say	1,500		
	103,224		

On the evening of the 25th McClellan was startled by tidings that Jackson was at hand and threatening his rear, and that A. P. Hill (who with Longstreet and D. H. Hill were designated by Lee to effect a junction with Jackson and break up McClellan's communications) had concentrated his division opposite the Union extreme right at Meadow Bridge. By 8 next morning Longstreet and D. H. Hill reached their posts in front of Mechanicsville. All waited the advance of Jackson. He, however, was delayed by Union skirmishers, and Hill, becoming impatient, crossed the river at 3 P. M. and pushed down the north bank till he arrived opposite Longstreet and D. H. Hill. They also crossed and joined him, whereupon the Union advance fell back from the village to a position beyond Beaver-Dam Creek.

The position, a strong one, was held by McCall. The creek was passable by artillery only by two bridges, one near its mouth at Ellison's Mill, the other a mile higher. It could be attacked in front only with heavy loss, but it could be turned on the right. A. P. Hill, supposing this to have been done by Jackson, marched across the open swept by the Union batteries, and assailed McCall's line, first on the right at the upper road and, failing there, then on the left at Ellison's Mill, where he was repulsed even more disastrously than on the right. At 9 o'clock the Confederates, beaten back at all points, fell back out of range and the combat of Mechanicsville, the first of the "Seven Days' battle" was at an end. Their loss was 250 killed and 1250 wounded; that of the Unionists 300 in all.

McClellan now gave up all thought of maintaining the north bank of the Chickahominy, and McCall and Porter were directed to abandon the position at Beaver Dam and take up a new one with Cold Harbor as their centre, five miles farther down, the sole object being the protection of the railroad along which the stores were being conveyed from White House for transference to the James.

On the morning of June 27th Porter and McCall, reinforced by the half of Franklin's corps, stood ready for action. The Confederates left Mechanicsville at dawn, but the bridges over Beaver Dam being down, it was noon ere they accomplished five miles. Passing Gaines' Mill (where a skirmish occurred which has given name to the whole engagement) they came in sight of the Union force drawn up on a hill-side across an unnamed creek. It was past 2 o'clock when the action began by A. P. Hill dashing across the intervening plain and swamp in the face of a fierce artillery fire and passing close up to the Federal infantry lines. For two hours the conflict raged, but the Confederates were eventually defeated and driven back. Jackson came now into view along with D. H. Hill, who had formed a junction with him. Longstreet, who had been held back for Jackson's approach, now joined himself with these, and an advance was ordered of the whole line. The assault was first made on the Union right held by Sykes with his regulars, and by 6.30 P. M. the whole Confederate force of 56,000 men was pressing on the Union line of 30,000, on right, centre, and flank simultaneously. The line gave way at every point, and its retreat threatened to become a rout, when French's and Meagher's brigades burst through the stragglers thronging to the bridge over the Chickahominy and advanced to what was now the front. The fugitives rallied; the Confederates paused in the pursuit, and after a few volleys the battle of Gaines' Mill was over. The Union loss was 675 killed, 3250 wounded, and 2000 men and 20 guns captured; the Confederate, 1500 killed and 8000 wounded.

When day broke on the 28th the whole Union force was across the river and the bridges broken. The problem before McClellan was how to transport his immense stores and trains to the James, some 17 miles from his head-quarters. During the night of the 28th his whole force was put in motion, while Lee, on

comprehending his object, ordered his entire force to start in pursuit. By dawn of the 29th all his columns were reunited on the S. bank and in motion, and in the afternoon Magruder came in sight of Sumner's corps drawn up as a rear guard at Savage's Station. A smart conflict of two hours ensued, with the sole result that while Sumner stood at bay the mighty Union caravan was passing White Oak Swamp and wending its way towards Malvern Hill. During the night the rear guard crossed the swamp, and Jackson, who arrived there on the 30th, found the bridges destroyed, and on trying to force his way across met with such resistance from Franklin, who stood on the farther side, that he was compelled to desist. Lee's object was to strike the Union line at its centre, break it and hurl its left wing back on Jackson. With this view Longstreet had flanked the swamp, and hurrying forward came on the line drawn up at Frazier's Farm. Supported by A. P. Hill, he charged with all his wonted impetuosity. Other divisions came up and the battle raged all along the line, night alone putting an end to the struggle. The Confederates slept on the field, having captured 20 guns as well as Gen. McCall, but the grand result of the action was to insure the integrity of McClellan's army. The troops that had checked Jackson and repulsed Longstreet withdrew during the night, and when Lee was next able to strike, it was at a united army posted on the strong position of the elevated plateau or heights of Malvern, and in close communication with its base on the James. Jackson had crossed the swamp and with all the other Confederate leaders was present at the battle that ensued. In the afternoon of the 1st of July Lee ordered an artillery attack, but this was made by only one battery, which was instantly shattered. Columns of attack led by D. H. Hill, Magruder, and Ewell repeatedly charged furiously in the attempt to establish themselves on the table-land. All failed to make any impression, or even disturb a single battery. The Confederates persisted in their desperate efforts till dark, when, repulsed everywhere with fearful loss, they ceased from the struggle, and the Union troops stood victors on Malvern Hill. During the night they were withdrawn to Harrison's Landing on the James, and the Seven Days' battle was ended. Neither Longstreet, A. P. Hill, nor Jackson took part in the fight. The loss on the Union side was 375 killed and 1800 wounded; that of the Confederates, 900 killed and 3500 wounded. The total loss from June 25th to July 2d (the Seven Days' battle) was, on the Union side: killed 1734, wounded 8062, missing 6053 = 15,849; on the Confederate side, killed 2823, wounded 13,223, missing 3360 = 19,406. At Harrison's Landing McClellan found himself at the head of from 85,000 to 90,000 effective troops, and purposed, in conjunction with the naval force, a grand attack on Richmond in the rear. On Aug. 3d he received a telegram from Halleck, now general-in-chief, ordering him to withdraw from the Peninsula, and his campaign there was at an end.

As a master of the art of war and an organizer, whether of an army or the complicated plans and operations of a campaign, it may be questioned whether McClellan had a superior among the generals in the great civil conflict, and certainly no one of them more entirely won the love and confidence of his men. But his military skill and organizing power as well as his faculty for winning men's hearts were largely neutralized by defects that operated to prevent him showing the qualities of a general of the first class. The most prominent of these was his inability in a critical moment to act with Napoleonic decision, swiftness, and effect. He halted between two opinions and hesitated, and so, more than once, let his opportunity slip. Thus, within little more than a day after his appearance before Yorktown he was at the head of over 100,000 men, with a splendid artillery, while Magruder lay behind its imperfect defences with but 11,000.

Of these, 6000 were in garrison in Yorktown, Gloucester Point, and Mulberry Island, leaving only 5000 men to defend his long line of 13 miles. McClellan was then in a position either to have turned Yorktown or to have broken Magruder's thin line by a direct attack. He hesitated and waited, and the result was that when he abandoned the former plan Johnston had come, and it was too late to attempt the other. "To my own surprise," says Magruder, "he let day after day pass without attack." Had he shattered Magruder and followed close on his heels to Richmond he might have carried it in its then comparatively weak state by the *coup de main* he dreamed of.

Again, the fundamental error of his selection of the White House as a base was that it made it necessary for him to have a force on the left bank of the Chickahominy to protect his line of communications. This crippled him for striking Johnston with a force so preponderating as practically to ensure victory. The moment all reasonable prospect of a junction with McDowell vanished, he ought to have transferred his depots and every man to the right bank, or at once have carried out his James River scheme. It was not till Lee was joined by Jackson and had replenished his ranks by conscription that there was any parity between the forces. "Gen. McClellan," says an able and friendly critic, "knew that the one course or other was necessary, but unfortunately the case was one presenting an alternative, and it was the nature of that commander's mind so to balance between conflicting opinions and let 'I dare not wait upon I would,' that he was apt to hesitate even in conjunctures where the worst course was preferable to doing nothing."

Again, during the battle of Fair Oaks McClellan lay with two army corps at his command at his headquarters at Gaines' Mill, whence he could see the smoke of the battle as it indicated the steady advance of the enemy. He could have left one corps to defend his communications and struck the Confederate flank with the other so as to turn Fair Oaks into a great victory. By consenting to defer, he lost an opportunity unexampled in the course of the war.

Military critics blame him for letting slip two other opportunities when he was lying on the south of the river. First, by not making a dash at Richmond when Lee had, on June 11th, sent Whiting to join Jackson in the Valley: and again, by lying supine when Longstreet, the two Hills, and Jackson with 60,000 men were attacking Porter and McCall with only 27,000, on the north bank, and he with a force equally preponderating over Lee's, was within easy striking distance of him.

As an evidence of his want of promptitude we may note Stuart's raid, which, with a Grant, a Sheridan, or a Thomas, would have been impossible. One thing is to be said for McClellan, that he acted under the conviction that he was subject to mistrust, and even to dislike, in high quarters, and that the worst construction would be put on any error. In a man of his temperament this feeling, no doubt, tended to paralyze action. On the whole it may truthfully be said that, although the campaign, viewed with regard to its aim, was a failure and left the prestige of victory with the Confederates, McClellan, in the conduct of his operations, showed the skill of a finished general; no one was more conscious than Lee of the adroit manner in which his antagonist parried his blows. His retreat, with endless trains of wagons and ambulances and 2500 live cattle over miserable roads (sometimes only one), and guarded by an army hungry, weary, and footsore, was executed in a manner to reflect the highest honor on commander and soldiers alike. "For the commander," says the Comte de Paris, "to have extricated his army from a difficult situation, in which circumstances as much as his own fault had placed it, and, in presence of a powerful, skilful, and determined adversary, transfer it safely to a position whence it could act with effect, was of itself a notable

achievement. With an ordinary man, the Army of the Potomac would have been destroyed." (J. H.)

PENN, JOHN (1741-1788), a signer of the Declaration of Independence, was born in Caroline co., Va., May 17, 1741. His early education was neglected, but he read law with Edmund Pendleton and was admitted to the bar in 1762. He was soon noted for his eloquence. In 1774 he removed to Greenville co., N. C., and was sent as a delegate to the Continental Congress, in which he signed the Declaration of Independence. He was again a member of Congress (1778-80), and when Lord Cornwallis invaded North Carolina Penn had charge of the affairs of the State. He died in September, 1788.

PENNINGTON, WILLIAM S. (1757-1826), judge and governor, was born in 1757 and served in the revolutionary army as major of the Second New Jersey artillery. After the war he became a lawyer, and in 1804 was made associate justice of the State Supreme Court. He was elected governor in 1813, and at the close of his term was made U. S. district judge. He died at Newark Sept. 17, 1826.

His son, WILLIAM PENNINGTON (1796-1862), graduated at Princeton in 1813, and studied law. He was clerk of his father's court (1815-26), became chancellor of the State, and from 1837 to 1843 was governor. In 1859 he was elected to Congress as a Republican, and his nomination by his party friends for Speaker of the House led to a struggle protracted through eight weeks and terminated in his favor Feb. 1, 1860. He served with ability in the trying times of the secession movement. He died at Newark, Feb. 16, 1862.

PENNSYLVANIA has, since the United States census of 1830, held the second rank among the States of the Union. It then outstripped Virginia, originally the leading State in population and importance, as New York had done in the census of 1820. The census of 1880 gave Pennsylvania a population of 4,282,891, which has since 1883 entitled the State to 28 representatives in the National Congress. After an abortive effort in 1885, a new arrangement of Congressional districts was made by the Legislature in 1887. The population has now increased beyond 5,000,000. To the excellent account of the State in the *ENCYCLOPÆDIA BRITANNICA* the following additions should be made:

Finances.—The public debt of the State on Dec. 1, 1887, was \$15,840,471.28, since which period there has been a redemption of nearly \$1,500,000. As an offset it may be noted that the Pennsylvania Railroad Company owes the State on the purchase of the internal improvements, originally made by State authority, \$9,000,000. Of the funded debt about \$5,250,000 drew 5 per cent. interest, and the rest $\frac{3}{4}$ and 4 per cent. The annual revenues of the State from all sources in the year ending Dec. 1, 1887, were \$7,498,125.54, while the expenses on State account were \$7,262,805.66. By law about \$1,500,000 annually passes into the sinking fund established for the payment of the State debt. The total amount raised by taxation for State purposes was \$6,495,704.26. Real estate, which is not taxed for State purposes, was valued at \$1,697,202,153. The stock and income of corporations were valued at \$1,200,000,000, and from taxes on this valuation most of the State revenues are derived. Personal property is assessed at \$263,814,762. The State tax-rate is 40 cents on \$100. The aggregate taxation for all purposes, general and local, is \$38,000,000.

From an early period the State liberally supported the various measures adopted to open communications

between the seaboard and the West. The system of canals and railroads completed in 1834 was the great means of developing her internal resources. The present State debt, although rapidly decreasing, remains as a result of her early enterprise in this direction.

In 1888 there were in the State 283 National Banks, and 79 banks and savings institutions with State charters. The paid-up capital of these various financial institutions exceeds \$90,000,000, with an outstanding circulation of about \$60,000,000.

Education.—In 1887 the number of school districts in the State was 2281. The estimated value of school property was \$36,991,147. In November, 1888, the percentage of population, over ten years of age unable to read, was less than 4 per cent.; unable to write only 6 per cent.

In 1864 the Pennsylvania Railroad Company donated the sum of \$50,000 for the support of the orphan children of the deceased soldiers in the war for the Union, and soldiers' orphans' schools were established by the State. Upwards of 17,302 children, of both sexes, have been educated in the various schools organized for this purpose. At present there are eleven schools located in various parts of the State. The number of children now being cared for, as appears by the roll for May, 1888, is 2249. From the period of the establishment of the schools down to the present time over \$10,000,000 have been appropriated and expended by the State. In addition to the sum annually appropriated for educational purposes directly about \$200,000 are appropriated for the education and maintenance of the deaf, dumb, blind, and feeble-minded of the State. The State College, formerly the Pennsylvania Agricultural College, and the Normal Schools established for the education of teachers, are liberally taken care of. In addition to the various colleges and universities schools for the special study of Science, Theology, Law, and Medicine are numerous, while there are upwards of 400 private academies and seminaries.

Although the recent records of the prisons, reformatories, and penitentiaries do not show an increase in crime proportionate to the estimated increase of population since the census of 1880, the almshouses give a marked increase in pauperism, and the number of insane persons has increased in even ratio with the population. This, however, is attributed to the better knowledge on the part of the people of the provision made by the State for this afflicted class, and greater willingness to avail themselves of it. Almost \$1,000,000 are annually appropriated to the various charitable institutions of the State, among which are the Soldiers' Home, recently established at Erie, and the Miners' Hospitals, which are solely under State direction. Various local hospitals are also provided for.

Manufactures.—Since 1880 the manufacturing industry of the State has been nearly doubled. The capital invested, cost of material, the total sum paid in wages to the number of persons employed, and the value of products is proportionately increased. This is particularly true in regard to the iron and steel manufactures, which have always been prominent in Pennsylvania. The utilization of natural gas for manufacturing purposes has given a special stimulus to many branches of industry, and has transformed the aspect of the region where it is abundant. The mining industry has also been increasing rapidly.

Railroads.—The total number of miles of railroad operated in Pennsylvania in 1888 is 9714. The aggregate length, however, of all tracks in the State exceeds 15,000 miles. The total cost of these roads and equipments exceeds \$1,013,450,000, not including the value of real estate held by the various companies, and also exclusive of roadway, which rises upwards of \$3,000,000. The total number of miles operated by these various companies amounts to 15,864 miles. The number of through passengers carried over these roads in 1887 was 4,525,612; the number of local passengers was 59,562,071, yielding a revenue of

\$39,819,422 from passenger traffic alone. The number of tons of through freight carried, exclusive of coal, was 40,633,688 tons, while that of local freight exceeded 100,000,000 tons.

During the year 1887 there was shipped over the various railroads of the State the following: Anthracite coal, 54,952,699 tons; bituminous coal and coke, 44,783,031; petroleum and other oils, 3,389,799 bbls.; pig-iron, 6,468,934 tons; railroad iron, 2,419,524; other iron or castings, 5,990,924; iron and other ores, 10,204,837. This is exclusive of the various products consumed at the place of supply.

There are also 519 miles of street passenger railways operated in the various cities of the Commonwealth. These have been constructed at an expense of \$12,326,068.

Canals.—Although the system of canals is gradually giving way to that of the railroads there are at present operated within the limits of the State 778 miles, of which 198 miles are slack-water navigation. The gross amount of tonnage passing over this system during 1888 exceeded 10,000,000 tons, and the receipts of tolls for the same were \$2,675,349.

The length of the main line of the Western Union Telegraph Company in Pennsylvania exceeds 9000 miles, while that of the Philadelphia and Reading system amounts to 870 miles.

Historical Notes.—When the province of Pennsylvania was settled by the English and Welsh Quakers under Penn a remnant of Swedish colonists was found along the Delaware. German and Swiss immigrants followed in succession. To them the State owes its character for industry and thrift.

The Scotch-Irish settlers from the North of Ireland came during the eighteenth century and were placed on the frontier counties of the province. To them the State owes its energy and intellectual culture. New Englanders, under the "Connecticut Claim," located in Wyoming, while the settlers in the western part of the State were made up of these diverse elements, the Scotch-Irish predominating. Owing to these heterogeneous elements the history and character of the State have often been misunderstood. Writers in many instances have failed to give proper credit to Pennsylvania for its contributions to the progress and welfare of the Union.

During the French and Indian War, from 1754 until 1764, owing to constant inroads made upon frontier settlements by marauding savages, from two to four regiments of provincials were constantly in the service. Three-fourths of these were Scotch-Irish settlers and residents on the frontier. In the Revolution, although Pennsylvania did not furnish as many troops for the Continental line as several other States, her large number of associators and militia in active service exceeded nearly all the States of the Union. The so-called revolt of the Pennsylvania line in January, 1781, was caused by the fact that the soldiers who were enlisted for three years, or during the war, were kept in service beyond the time for which they had enlisted, viz., three years.

With the exception of the railroad riots of 1877, which, at that time, extended widely over the United States, the disturbances in Pennsylvania have been merely local affairs, and do not warrant the assertion that they were caused by any general dissatisfaction with the Government or with the laws of the land.

The first State Constitution framed was in 1776, when the Proprietary Government ceased. Slavery was abolished in 1780. In 1789 the Constitution was revised; again in 1837-38; and finally in 1874. The latter revision was ratified by over 100,000 majority. Its new features are limiting the term of the Governor to four years (ineligible to re-election), providing for a Lieutenant-Governor, with various other officers to be elected by the people, increasing the number in the legislative body, and in several of the county offices providing for minority representation. (W. H. E.)

PENNSYLVANIA, UNIVERSITY OF. This institution, established in Philadelphia, claims as its founder Benjamin Franklin. In 1749 he issued anonymously *Proposals Relative to the Education of Youth in Pennsylvania*, which led influential citizens of Philadelphia to form an association and raise over £2000 for the purpose of an academy. A building which had been erected to accommodate the congregation of Whitefield was purchased and opened as "The Academy and Charitable School" in 1751. It contained an English, a Mathematical, and a Latin School. Two years later a charter was obtained from Thomas and Richard Penn, the proprietors of Pennsylvania. Rev. William Smith, a graduate of the University of Aberdeen and a clergyman of the Church of England, was invited to take charge of the academy. Such was his success that in 1755 a new charter was granted, raising the school to the dignity of "The College and Academy of Philadelphia." Its first commencement was held in 1757, when seven young men received the degree of Bachelor of Arts. Provost Smith made two visits to England in behalf of the College, and obtained for its use more than £6000, while the University of Oxford conferred on himself the degree of D. D. The College received other donations and legacies, yet for the erection of its own building in 1762 the trustees availed themselves of a lottery, a plan then not unusual with religious and charitable enterprises. Rev. Francis Alison (1705-1772), a Scotch-Irish Presbyterian minister, was the vice-provost of the college from 1755 until his death. Rev. Ebenezer Kinnersley, who shared in Franklin's electrical experiments, taught oratory and English literature. In 1765 a medical school was projected and it became an important part of the institution. Its growth will be noticed later in this article.

During the Revolution Provost Smith adhered so firmly to the British Parliament and the Proprietors that the Legislature of Pennsylvania caused his arrest and imprisonment, but he received and instructed his classes even while in jail. In 1779 the Legislature, in the excess of its patriotic zeal, annulled the charter of the college and bestowed its rights and properties on the "Trustees of the University of the State of Pennsylvania." Liberal grants were also made to the new body from the confiscated estates of royalists. Rev. Dr. John Ewing (1732-1806), a graduate of Princeton College and the pastor of the First Presbyterian Church of Philadelphia, was then made provost, and David Rittenhouse, the astronomer, was vice-provost. In 1789, when the Federal Constitution was adopted and a new government firmly established, the friends of Dr. Smith procured the reversal of the former act of the Legislature and the reinstatement of the college trustees. In 1791, by an act of the Legislature, the two bodies were united in one under the present title. Dr. John Ewing remained provost until his death in 1806.

The subsequent provosts have been as follows: Rev. John McDowell, D. D., appointed 1806; Rev. John Andrews, D. D., 1810; Rev. Frederick Beasley, D. D., 1813; Rev. W. H. De Lancey, D. D. (afterwards bishop), 1828; Rev. John Ludlow, D. D., 1834; Henry Vethake, LL.D., 1853; Rev. Daniel R. Goodwin, D. D., 1860; Charles J. Stille, LL.D., 1868; William Pepper, M. D., LL.D., 1881.

In 1828 two large and commodious buildings were erected on Ninth street below Market, one for the Department of Arts, the other for the Department of Medicine. These continued to be used until 1872, when the site was sold to the U. S. government for the erection of a post-office. The Law School, which had been organized in 1789, and other associated departments, were also accommodated in the Arts building. In the course of time the fame and growth of the Medical Department had greatly surpassed those of the Department of Arts. Although the successive provosts and professors were men of culture and

acknowledged ability, their labors were confined to a narrow field and a traditional curriculum. Even the city of Philadelphia, from which alone the students in general came, sent as many more of her youth to other colleges for a liberal education. Dr. Charles J. Stille, who became professor of English literature in 1866, began at once an active effort for the improvement and enlargement of the University. A year later he was made provost and his ability to effect changes was greatly increased. He succeeded in stimulating the liberality and civic pride of wealthy citizens of Philadelphia. He also enlisted the aid of the authorities of the city and State. As a result of his persevering labor the University obtained a tract of more than ten acres in West Philadelphia, on which new and imposing buildings were erected. The main building, in the collegiate Gothic style, has a front of 260 ft. and a depth of 100. It consists of a central building containing the chapel, library, and other rooms, and two wings, the western arranged for the Department of Arts, and the eastern for the Department of Science. This building was publicly inaugurated with appropriate ceremonies Oct. 11, 1872. Dr. Stille had not limited his efforts to providing better accommodations for the work of the University. He had greatly enlarged the instruction in science, as required by the demands of the age, and organized for it a separate faculty. This new department afterwards took the name "The Towne Scientific School," from one of its liberal benefactors.

Under the liberal administration of Dr. Pepper the University has acquired 17 more acres of land and has continued to increase the number of its buildings, courses of study, professors and students. To the College Department has been added the "Wharton School of Finance and Economy," founded by the liberality of Joseph Wharton and designed to give liberal and special training to young men who expect to enter on the management of large business. There have also been added three new faculties—the Veterinary, the Biological and the Philosophical, and in connection with these appropriate buildings—the Veterinary Hall and Hospital and Biological Hall. There have also been erected a Nurses' Home and Maternity Hospital. To the course in music and many of the lectures in other courses women are admitted. The instruction in the law department is now given in the central part of the city, where it is expected that a special building for this purpose will be erected. An Alumni Hall on the University grounds is also projected.

The public-spirited citizens who had taken part in the founding of the college made to it valuable donations of books as the nucleus of a library. Unfortunately, owing to various causes, this important adjunct to liberal training was neglected. Few additions were made to the stock of books until the University was removed to West Philadelphia. On entering its new buildings the University received from the family of Stephen Colwell a valuable collection of books on political economy; the library of Prof. George Allen, rich in classics, bibliography, Shakespeare and the art of war. Other additions were made at various times, and in October, 1888, was laid the corner-stone of a Library Building, which will furnish accommodation for 500,000 books. The valuable philological library of Prof. F. A. Pott (*q. v.*) was purchased for the University by some alumni. The law library of Hon. Benjamin H. Brewster, U. S. attorney-general, was presented in the name of George Biddle. The total number of volumes in the library is about 55,000.

As already mentioned, the Medical School was projected in 1765. Dr. John Morgan, a pupil of Hunter and Cullen, filled in it the first medical professorship created in America. The school was organized in 1767 with Dr. Morgan as professor of the theory and practice of physic, and Dr. William Shippen as professor of anatomy and surgery. Able professors, including Dr. Benjamin Rush, were added within a few

years. Other professors of national reputation have succeeded to this faculty at various times. The first commencement at which medical degrees were conferred in America was held here in June, 1768. Since that time over 10,000 graduates have received diplomas whose worth has been acknowledged in all parts of the world. One unpleasant result of this wide reputation was the attempt of unprincipled men to sell diplomas pretended to be issued by its authority. The fraud was soon discovered, but to uproot it required the effort of years. Finally the chief offender was convicted and imprisoned and the Legislature of Pennsylvania formally annulled the simulated charters. In 1864 an auxiliary department of medicine was instituted through the liberality of Dr. George B. Wood, one of the distinguished professors. Its course is essentially post-graduate, and is intended to give instruction in collateral branches of science as needed for the thorough education of a physician. The Medical Department has shared in the changes produced by the removal of the University to West Philadelphia and the erection for its use of a commodious building. An excellent hospital and an extensive laboratory have been erected in connection with this department. The course of instruction in medicine here pursued since 1877 is a graded one, extending over four years, though diplomas are granted to those who have successfully completed three years of the course. Advanced students are encouraged to make original researches in the various laboratories. Since the present system was adopted the zeal and general proficiency of the students have increased to a marked extent. (See MEDICAL COLLEGES OF AMERICA.)

The departments of the University fully organized and in operation are those of Arts and Science, Medicine, Law, Dentistry, Philosophy, Biology, and Veterinary Medicine. The University has nine large buildings—the College Hall, Medical Hall, Laboratory, Hospital, Veterinary College and Hospital, Biological Hall, Home for Nurses, Maternity Hospital, Library. Close to the University buildings are the Athletic grounds, which, as well as the gymnasium, furnish facilities for physical education, which is here under the direction of a competent instructor. The Catalogue for 1887-88 shows the total number of professors and instructors to be 152; the number of students in the College Department, 324; in the two Medical Departments, 445; in the Department of Dentistry, 123; in the Department of Veterinary Medicine, 57; in the Department of Biology, 30; in the Department of Law, 159; in the Department of Philosophy, 54; total, 1187. (J. P. L.)

PENOBSCOTS. See ABENAKIS.

PENSACOLA, a city of Florida, the seat of Escambia co., is on Pensacola Bay, 5 miles from the Gulf of Mexico, and 262 miles E. of New Orleans. It is a terminus of the Louisville, Nashville, and Southern, and the Pensacola and Atlantic Railroads. The latter crosses part of the bay on a pile-bridge 6 miles long. The city has a custom-house, court-house, marine-hospital, 4 hotels, 1 national and 2 other banks, a weekly and a daily newspaper, 10 churches, and 8 schools. There are 2 foundries, and several lumber- and planing-mills. The city has gas- and water-works, and parks averaging 5 acres. Its property is valued at \$3,000,000, its public debt is \$280,000, and the yearly expenses are \$45,000. The city draws 300,000,000 feet of yellow pine from the forests of Alabama, and ships it to all parts of the world. Fishing is an important industry, the pompano, red snapper, and grouper, and other varieties, being abundant in the vicinity.

Pensacola was settled by Spanish colonists before 1700. In 1719 it was captured by Bienville (q. v.), but soon afterwards was restored. The British had possession of West Florida from 1763 to 1781, and during the wars with Napoleon they were allowed to hold Pensacola, and organize expeditions in its harbor. Gen. Andrew Jackson seized the town Nov. 6, 1814,

and the British withdrew, after blowing up the fort. In prosecution of the war with the Seminoles, in 1818, Jackson again invaded Florida, and seized Pensacola, on the plea that the Spanish authorities abetted the Indians in hostility. By the treaty of 1819 Florida became part of the United States.

Pensacola Bay forms an excellent land-locked harbor nearly 8 miles long. The entrance between Santa Rosa Island and the mainland is a mile wide, and is guarded by Forts McRee and Pickens, the latter on the island. The depth of water on the bar is 21 feet, and at the wharves 26 feet. Besides a lighthouse, there are a navy-yard, marine-hospital and barracks, and in the vicinity the villages of Bagdad and Milton. When Florida seceded in January, 1861, the navy-yard was surrendered without resistance to a body of State militia. But Lieut. A. J. Slemmer, who had taken 80 soldiers and marines from Fort Barrancas to the more defensible Fort Pickens, refused to surrender. After fruitless negotiations at Washington, Col. Harvey Brown was sent with 750 men to take command. Other reinforcements were sent, which encamped on the island. After some vain attempts to dislodge them, and some ineffectual artillery practice, Pensacola was evacuated by the Confederates. In February, 1864, a fire destroyed much valuable property. Since the close of the war Pensacola has slowly recovered from its effects. It has occasionally been visited by yellow-fever, and in 1882 this disease is said to have carried off 200 inhabitants. Yet, with proper sanitary regulations, the city can be kept free from this plague, and in other respects its salubrity is unquestioned.

PENSION SYSTEM OF THE UNITED STATES.

A pension is a stated allowance of money to a person by the government in consideration of merit or the nation's gratitude for services rendered—civil, military, or naval; to provide for the casualties of battle, and to encourage enlistments, continued service, and personal bravery in the contingency of war. Pensions are granted either under authority of existing general laws, or by special act of Congress. Prior to 1858 the weight of authority ruled that a pension law was a contract and the pension granted thereunder a debt. This was the view held by Attorney-General Cushing. Since 1858, the Secretaries of the Interior, who have appellate jurisdiction in the decisions of the Commissioner of Pensions, have invariably held that it is a gratuity, and no part of a contract for service rendered; that it is not a vested right; that Congress by legislation can terminate all rights existing under former pension laws; that a pension is a payment for loss of physical disability to earn a livelihood, determined solely by the degree of disability. The question, *per se*, as to whether a pension is a gratuity, has never been decided by the U. S. Supreme Court.

The pension system of the United States differs from that of most other countries in two important particulars: first, pensions, with a very few exceptions, are granted on account of military service only; there is, consequently, no large civil list; secondly, owing to the fact that the United States has no large standing army, but depends in case of war upon temporary levies, its pension legislation has to do chiefly with the volunteers and conscripts of its various wars rather than with regular troops; hence it is that long service, an important element in foreign systems, is not recognized as a basis for pension in this. Military pensions comprise two general classes: *Invalid pensions*, paid to those who in whole or in part are disqualified for the performance of manual labor by reason of wounds or disease contracted in the military or naval service; and *Service pensions*, into which the question of disability incurred by reason of the casualties or incidents of military or naval service does not necessarily enter. Service pensions are usually granted by general acts many years after the termination of the war to which they relate; Revolutionary pensions, thirty-five years

after; War of 1812, fifty-nine years after, and Mexican war, thirty-nine years after.

I. Historical.—Within the past quarter of a century the pension system of the United States has developed from an inconsiderable establishment to a great bureau whose operations reach out into nearly every hamlet and township in the Union. Its clientage and disbursements surpass the most extravagant dreams of its founders. It may properly be said to commence with the resolution of Congress dated Aug. 26, 1776, by which the Continental Congress undertook to provide for disabled soldiers of the Revolution. From June 7, 1785, to Sept. 29, 1789, the several States assumed the payment of pensions by a recommendation of Congress on account of its inability to raise money by taxation. After the adoption of the new Constitution Congress resumed their payment by annual enactments, making them payable during the life of the beneficiaries, under the acts of March 23, 1792, and Feb. 28, 1793. By the act of April 10, 1806, pensions to be allowed thereafter were confined to those who had received "known wounds," and extended to the militia and State troops serving against the common enemy. The rate for total disability for an officer was one-half of his monthly pay, not, however, to exceed the pay of a lieutenant-colonel, and for an enlisted man, \$5 per month. Service pensions for the Revolution were allowed under act of March 18, 1818, to indigent survivors at \$20 per month for officers, and \$8 for privates. These benefits were further extended by the acts of May 15, 1828, June 7, 1832, July 4, 1836, and Feb. 3, 1853. Pensions were not provided for the children of Revolutionary soldiers. The first act providing pensions for disabled officers and soldiers of the regular army was passed April 3, 1790, and its provisions were renewed and amended from time to time until they were embodied in the act of March 16, 1802, which is now the fundamental law for pensions on account of disability incurred prior to March 4, 1861. This act provided pensions for widows and children of officers dying in the service of wounds received in actual battle, the rate being one-half monthly pay at date of death. From the date of the passage of this act to March 4, 1861, invalid pension acts in the interests of those serving in the Mexican war and various Indian disturbances and wars, and of the regular army in time of peace, referred directly or indirectly to this act, as containing the principles guiding in their adjudication. Surviving veterans and widows of deceased soldiers of the war of 1812, who served sixty days—it being required of the widows that marriage should have taken place before the close of that war—were allowed service pensions of \$8 per month from Feb. 14, 1871, the date of the passage of the act, upon proof of loyalty during the Rebellion. Soldiers and widows of soldiers of that war are allowed service pensions at \$8 per month without condition as to the date of marriage or loyalty, in case of a service of fourteen days, or in battle, under act of March 9, 1878. Widows' pensions under both these acts have been increased by the act of March 19, 1886, to \$12 per month. The act of Jan. 29, 1887, granted, from the date of the passage of the act, pensions to survivors of the Mexican war, who, being duly enlisted, actually served sixty days with the army or navy of the United States in Mexico, or on the coasts or frontier thereof, or *en route* thereto, in the war with that nation, or were actually engaged in a battle in said war, and were honorably discharged, or who have been personally named in any resolution of Congress for any specific service in said war, and to the surviving widows of such officers and enlisted men: Provided, that such survivors and widows have attained the age of 62 years, or are disabled or dependent owing to some cause recognized by the pension laws as sufficient reason for the allowance of a pension. Pensions under this act are at the same rates as under the preceding acts.

The last two surviving revolutionary soldiers who

were allowed pensions under the general laws were William Hutchings, of Hancock co., Me., who died May 3, 1866, aged 102 years, and Samuel Downing, of Saratoga co., N. Y., who died Feb. 18, 1867, aged 101 years. The following revolutionary soldiers were granted pensions by special act, dated Feb. 22, 1857: John Gray, Noble co., Ohio, who died March 28, 1869, aged 105 years, and Daniel F. Bakeman, of Cataraugus co., N. Y., who died April 5, 1869, aged 109 years. On June 30, 1888, there were 37 persons drawing pensions as the widows of soldiers of the Revolutionary war. Within the past year the names of Nancy Buntin, widow of William Buntin, of Tennessee, and aged 84 years; Mary Casey, widow of John Casey, of Ohio, aged 88 years; and Frelove Barnes, widow of Jonathan Seeley, of Michigan, aged 92 years, have been added to this roll.

The number of pensions granted under all laws to soldiers of the Revolution and their widows is 62,069; war of 1812, 60,670, amounting to \$36,310,256.04; Mexican war, 21,724. By the act of March 2, 1833, the administration of the pension system was raised to the dignity of an independent bureau, under the management of a Commissioner of Pensions. Prior to this time the pension laws had been administered under the direction of the Secretary of War, except those which related to naval pensions, which were under the administration of the Secretary of the Navy, and the laws granting bounty lands, which were administered under the direction of the Secretary of the Treasury. Both these branches were subsequently transferred to the pension office, the former, March 4, 1840, and the latter, Jan. 20, 1843. On March 3, 1849, the pension office became a bureau of the newly created Department of the Interior. As at present organized its affairs are administered by a commissioner, under whose charge come all matters relating to pensions, and who is appointed by the President, by and with the advice and consent of the Senate, two deputy commissioners, a chief clerk, an assistant chief clerk, a law or appeal clerk, a board of legal reviewers, a board of medical reviewers, special examiners, examiners' clerks, copyists, messengers, laborers, and watchmen, in all a force of 1554 persons, directly engaged in the settlement of claims for pensions. In addition to these there are at various points throughout the country 2515 surgeons, whose duty it is to examine all applicants for invalid pension who may be ordered before them, and report to the Commissioner of Pensions as to the degree of the applicant's physical disability. This makes over 4000 persons under the management and direction of the Commissioner of Pensions. In addition to this there are 18 Pension Agents for the payment of pensions, conveniently located throughout the country, under his direction, and who are also appointed by the President by and with the advice and consent of the Senate. The salaries and expenses of this large force amounted in the aggregate to \$3,262,524.67 for the fiscal year ending June 30, 1888.

II. Statistics.—The following statement shows the remarkable growth of the U. S. pension system from its humble beginning: The total amount expended by the Bureau of Pensions for all purposes during the fiscal year ending June 30, 1888, was \$82,038,386.59, being 21½ per cent. of the total (estimated) gross income—\$380,000,000; and 31 per cent. of the entire expenditures—\$267,924,801.13—of the U. S. government for the same period; about 65 per cent. of the cost of the entire military establishment of France, 80 per cent. of that of England, 90 per cent. of Germany's, and \$30,730,784.59 more than that of Austria-Hungary. During the same fiscal year \$1,439,530.10 were paid as fees to attorneys alone. From 1861 to 1888 inclusive, 1,166,926 claims for pension have been filed, 737,200 have been allowed, and \$963,086,444.73 have been disbursed on account of pensions.

At the close of the fiscal year ending June 30, 1888,

there were 452,557 pensioners upon the rolls, classified as follows: 323,020 late war army invalids; 90,845 late war army widows, minor children, and dependent relatives; 3815 late war navy invalids; 2083 late war navy widows; 806 survivors of the war of 1812, and 10,787 widows of those who served in that war; 16,060 survivors of the war with Mexico, and 5104 widows of those who served therein. During the same year there were received 2,697,608 pieces of mail matter, and 2,041,482 were sent out. The highest rate of pension issued during the year was \$2000 per annum; the lowest now being granted is \$24. The annual average value of a pension for the same year is \$125.30. The average age of pensioners, 67 years; average length of service for which pensions are granted on account of the war of 1861-65 is two years. The highest rate of pension paid under the general law is \$72. Allowances by special acts of Congress range from \$10 to \$416.66 per month. Up to June 30, 1888, three persons were receiving \$5000, four were receiving \$2000, and five were receiving \$1200 per annum under special acts of Congress; 1053 were receiving \$72 per month. From 1861 to 1865 President Lincoln approved 41 special pension acts; from 1865 to 1869, President Johnson, 431; from 1869 to 1877, President Grant, 490; from 1877 to 1881, President Hayes, 303; from 1881 to 1885, Presidents Garfield and Arthur, 736; from 1885 to 1888, President Cleveland, 1577, making a total of 3578. On June 30, 1888, there were 2363 pensioners, receiving \$367,976 annually, who resided in foreign countries; 1004 in Canada, 38 in France, 375 in Germany, 527 in Great Britain, 58 in Switzerland, and the remainder throughout Europe, Asia, Africa, and Australasia.

III. *Who are entitled to Pension?*—1. All officers of the army, including regulars, volunteers, and militia, officers of the navy and marine corps, and all enlisted men however employed in the military or naval service who have been disabled by reason of wounds or injuries received or disease contracted in the service of the United States and in the line of duty. These constitute the class known as "invalid pensioners."

2. The widows, or minor children under sixteen years of age, of all officers and enlisted men of the army or navy who have died of wounds or injuries received or disease contracted in the service and line of duty. The widow of a soldier who died of disease contracted in the military service prior to March 4, 1861, is not entitled to pension unless the cause of death originated in some war; and the widow of an officer or enlisted man in the navy who died of disease originating prior to March 4, 1861, is not entitled unless he died in the service.

3. The dependent mothers, fathers, or minor brothers and sisters of such officers and enlisted men who died of injuries or disease originating as above stated, and left no widows or minor children surviving. Dependent relatives are entitled in the order in which they are named. Upon the death of the mother the father becomes entitled, and upon the death of the father the minor brothers and sisters (jointly). They must have been dependent upon the soldier for support, in whole or in part, at the date of his death, otherwise there is no title.

4. The several classes above mentioned who are entitled to service pension under the various acts of Congress for services rendered in the Revolutionary war, war of 1812, and Mexican war.

IV. *Rates and Duration of Pensions.*—The original rate of a pension was half the monthly pay the beneficiary had received as an officer or an enlisted man. In 1816 the "total pension" for privates was increased to \$8 per month, and this rate, although in many cases grossly disproportionate to the degree of disability, was the highest that could be allowed to persons under the rank of commissioned officers until about the close of the civil war. The "total" rate for second lieutenant was \$15; first lieutenant, \$17; cap-

tains, \$20; majors, \$25; and lieutenant-colonels and all officers of higher rank, \$30. Like rates were fixed for naval officers of the same relative rank. Fractional ratings were given for lesser degrees of disability. In 1866 Congress created three grades above that of "total pension," and the pension for all these grades has since been increased. What is known as the first grade includes cases of permanent disability in a degree requiring the regular aid and attendance of another person, and entitles the beneficiary to \$50 per month. On June 16, 1880, an act was passed increasing the pension of all who were then on the roll at \$50 to \$72. By a liberal interpretation this has been held to include those who were then entitled to \$50; but those who have become entitled to a first grade pension since that date receive only \$50. The second grade includes cases of permanent incapacity for the performance of any manual labor, for which the pension is \$30 per month. The third grade is for a disability equivalent to the loss of a hand or foot, the rate being \$24 per month.

For disabilities below these three grades the rates range from \$2 to \$18 per month for privates, non-commissioned officers and lieutenants, the maximum in the cases of officers above the rank of lieutenant being the old "total of rank." There is also a class of "permanent specific" disabilities, for which the rates are fixed by law, such as the loss of both feet, both hands, or both eyes, for which the pension is \$72 per month. For amputation at the shoulder or hip joint, or so near the joint as to prevent the use of an artificial limb, \$45 per month is paid; for total disability of an arm or leg, loss of one hand and one foot, or total disability in the same, or amputation at or above the knee, \$36; for the loss of a hand or foot or total disability in the same, or for total deafness, \$30 per month.

Widows of privates receive \$12 per month, and \$2 additional for each child of the soldier, and when no widow survives minor children receive their pension jointly; dependent relatives receive \$12 per month; widows and dependent relatives of commissioned officers receive the "total of rank." The pension of a survivor of the war of 1812 or of the Mexican war is \$8 per month. Pensions on account of disability or death from causes originating prior to the beginning of the civil war commence from the date of discharge or death of the soldier, if the application was made within three years of the time the right of pension accrued, otherwise from the date of completing the proof. Pension on account of disability from causes occurring since the beginning of the civil war begin from the date of discharge or death of the person having prior right to pension, provided application was made before July 1, 1880; otherwise from the date of filing application, except in the case of widows, whose pensions begin from the time of the soldier's death without regard to the date of application. Widows' pensions are generally granted for life, but pensions to minor children, brothers and sisters terminate when they attain the age of sixteen years, or, in the case of sisters, when they marry. Widows' pensions end when they remarry. The open and notorious adulterous cohabitation of a widow operates to terminate her pension, and an invalid pension may be withdrawn if it be shown that the disability has ceased.

V. *How Pensions are Allowed and Paid.*—The great majority of claims are adjudicated upon *ex parte* testimony filed by the claimants, or their attorneys, but if doubt or suspicion arise in regard to the merits of any claim the papers may be referred to a special pension examiner, who will proceed to take testimony in the neighborhood where the claimant resides, or in such other places as may be necessary, and report the facts to the Commissioner of Pensions. Pensions are paid every three months through 18 U. S. Pension Agencies referred to above. At each of these agencies a permanent roll is kept of all pensioners residing within its limits, showing the class, sex, rates of pension and

PENSION SYSTEM.

Table of United States Pensions and Pensioners

In the total number of applications filed in 1888 are included 5045 survivors and 2808 widows of the war with Mexico. In the total number of claims allowed in 1888 are included 9048 survivors and 4201 widows of war with Mexico.

In the number of pensioners on the roll under the head of "Invalids" and "Widows," etc., are included survivors and widows of the war of 1812, respectively, commencing with the year 1871, and survivors and widows of the war with Mexico, commencing with the year 1877.

post-office address of each. Those who live in the city where an agency is located, or in its vicinity, generally appear in person at the office of the Pension Agent on the quarterly pay-day, and receive a draft on the U. S. Treasury; to others a like draft is forwarded by mail. A form of affidavit or voucher must be executed by the pensioner before a magistrate, which with his pension certificate must be exhibited to the Pension Agent before payment is made. The largest number of payments at any one agency is that of Columbus, Ohio, where 44,405 pensioners are paid. The largest number of pensioners in any one State is that of New York, where 45,249 reside, to whom are paid \$5,486,019.84 annually.

M. F. G.

PENTATEUCH AND JOSHUA. The article on this subject in the *ENCYCLOPÆDIA BRITANNICA* is essentially a presentation of one out of several controverted views. In the present state of Pentateuchal discussion this is not a severe criticism, but is merely a statement of a fact which largely determines the form of the present supplementary article.

It would be generally agreed, no doubt, that the Hexateuch is essentially a literary unity. One scholar might claim that this unity arises from the fact that Moses personally wrote the Pentateuch, while some one in sympathy with him supplemented his work by writing the Book of Joshua; and another might claim that it arises from the Hexateuch having been put together, partly from older documents, by a scribe or succession of scribes who lived a thousand years after Moses; and others might make still different claims; but as to the unity itself there would be no difference of opinion. It is a single work, with a single purpose, every part of it bending to that purpose, no matter how it came to be so. It would also be agreed that the unity of this work is not that of strictly continuous composition in one vein. It has a great variety of contents. It is a prose work, but includes a considerable number of poems, *e. g.* Gen. xlix.; Ex. xv.; Num. xxiii., xxiv.; Deut. xxxii. 1-43; Deut. xxxiii. It also includes several formal orations, or addresses, *e. g.* Deut. i. 3-iv. 40; Josh. xxiii.; Josh. xxiv., etc. It further contains a large body of legislation of the greatest possible variety of form and scope. In Ex. xxi.-xxiii., in connection with Ex. xx. and xxxiv. 10-26, is a compact, codified list of precepts, largely in the apparent form of decisions on adjudicated cases, in shape to be easily memorized, and suited to practical judicial use. Again, in Deuteronomy there is a more extensive collection of laws, with a bulky historico-homiletical comment on them. These two codes are designed for magistrates and people of all classes. Besides these, and of considerably larger bulk, is an additional collection of laws, scattered through the different books, and designed especially for the information of the priestly class. This legislation consists partly in records of precedents, partly in manuals for particular services, partly in alleged proclamations, general orders, return-reports, and the like. While certain portions of it are very carefully arranged in order, this class of the legislation as a whole exhibits no trace of orderly arrangement or of codification. These various poems, addresses, laws, heterogeneous as they are in themselves, are bound together, partly by being arranged in a certain order, but mainly by being imbedded in a connecting narrative. The narrative itself, moreover, is frequently duplicated, and this and other phenomena are supposed to indicate that previously existing narratives have been incorporated into it.

These facts as to the contents of the Hexateuch throw light upon the nature of the literary processes by which it was produced. One who holds that Moses wrote the Pentateuch in substantially its present form should also hold that Moses first accumulated a mass of materials in the shape of poems, addresses, laws in various forms, narratives, and afterward wove these

together, adding whatever was needful for the purpose. One who holds that the book is divinely inspired should also hold that the method just mentioned was the method through which divine inspiration operated in this case. And those who do not hold to the Mosaic authorship, or to divine inspiration, should yet hold that these previously existing materials, in some shape, were a fact, and that they were somehow put together to form the present unity known as the Hexateuch. Further, no one probably would dispute that the different parts of the Hexateuch present differences of literary style, vocabulary, local and temporary point of view, and the like, as decided as the difference in the contents of these different parts.

Such, in outline, are the phenomena indisputably presented. The views now current may of course be generically classified as two: the views of those who hold that Moses is the author of the Pentateuch, and the views of those who deny this. Of those who deny the Mosaic authorship some reject, in the main, the external testimony in the case, including that of the Old and New Testaments, as unhistorical, and deny that the distinctively Israelitish legislation is properly of Mosaic origin; while others affirm the historicity of the Scriptures and the genuine Mosaic origin of the law. Again, the present generation of the scholars who deny that Moses wrote the Pentateuch are pretty well agreed (though not unanimous) in the opinion that the legislative portion of Deuteronomy was written about the time of the great reformation under King Josiah. As to the dates of most of the other parts they disagree greatly. In particular, one school of them (that represented in the *ENCYCLOPÆDIA BRITANNICA*) hold that the priestly legislation is later than Deuteronomy, dating from the times of Ezra and later; while another school, formerly very prominent, and now again coming to the front, hold that the priestly legislation is earlier than the Deuteronomic.

Those who hold that Moses wrote the Pentateuch may be classed in three groups. The first group hold to a mechanical theory of Mosaic authorship; Moses wrote the Pentateuch by dictation from God, or in some such way, so that he may as well have written the account of his own death as any other part of it. Probably it would now be difficult to find scholars who deliberately teach this; the place where it mainly crops out is in the assumptions made by certain men, notably by certain newspaper controversialists when they attack men whom they suspect of heresy. The second group hold to what may fairly be called the traditional view of the Mosaic authorship, namely, that Moses personally wrote the five books, but that the post-Mosaic elements in them were added by later hands, at some unknown period or periods. This view at first sight seems simple and satisfactory, each person who holds it admitting the existence of a very few passages that contain elements later than Moses. But while some make one concession and some another, the number of conceded instances on this theory of irresponsible or at least anonymous tampering with the Mosaic text becomes quite appalling. The third group hold what we may fairly call the modified view of the Mosaic authorship. For my own part, I should state this view thus: Moses is the author of the Pentateuch, and Moses and Joshua the authors of the Hexateuch, in the sense of being responsible for the literary existence of these books in their present form. But they may have been, and most likely were, the authors of them in the way in which one would naturally expect public leaders, such as they, to be the authors of such writings as these. That is to say, they are likely to have written some parts personally, to have written some parts through amanuenses, to have caused other parts to be written by directing secretaries to write them, or by accepting documents prepared to their hand, to have taken other parts from the works of earlier authors. In such a case, the question whether they themselves gathered the writings into their present

form or left that for their successors to do is an open question until it is settled by evidence. Their claim to authorship would not be in the least impaired if it could be shown that the writings were collected into a whole, and parts of them written, by men of the generation that had been associated with Moses and Joshua, and had survived them. Whether their claim to authorship would be impaired on some theory that dated the collection of the writings yet later would depend somewhat on the details of the theory. This last question, however, it is hardly worth while to discuss, unless upon inquiry other views are found to be untenable.

The following proposition would perhaps be accepted in common by all advocates of the Mosaic authorship of the Pentateuch, though many of them would regard it as stating only a part of the truth: The Hexateuchal writings were produced in part by Moses and Joshua, and in part by other men under their influence, and were substantially completed within the lifetime of men who were associated with Moses and Joshua in public affairs. In opposition to this, living scholars who deny the Mosaic authorship of the Pentateuch generally hold that the legislation of Deuteronomy was written in the times of King Josiah, and the other parts of the Hexateuch, some earlier and some later than this. These two propositions are not exhaustive of the question; but, if we examine the evidence bearing upon them, we shall not merely argue the question they present, but shall touch most of the points of interest that properly belong to this supplementary article.

I. The Direct Testimony, and the Reasons Alleged Against it.—To begin with, the direct testimony in the case is very abundant, and no one disputes that it is altogether to the effect that Moses is the author of the Pentateuch. The Rabbinical writings, Josephus, Philo, the Alexandrian Jewish literature, the Apocrypha, are explicit on this point, and often full in details; they betray hardly any difference of opinion, except as to whether Moses wrote the account of his own death, as well as the rest of the Pentateuch. The books of the Old and New Testaments are equally full, though somewhat less explicit. There is no room to exhibit this testimony here, and no need to do so. One line of it can be readily examined by looking up in the Concordances of the Bible and in the indexes of the other books what is said concerning "the book," "the law," "Moses." A moderately full presentation of the Biblical direct testimony may be found in such works as those of Stebbins, Harman (see titles in *Literature at end*), or *Essays on Pentateuchal Criticism*, Nos. v., vi., vii., viii., xi. A considerable number of the passages are cited in the article BIBLE, in this work.

The Biblical testimony in this matter differs from that of the Jewish and Christian tradition outside the Bible, in that it never speaks of the Mosaic books as being five in number, and, except in the Hexateuch itself, mentions no details as to the writing of the books by Moses. But the books of the New Testament and the later books of the Old Testament so cite and refer to the Pentateuchal writings as to leave no doubt that these are the writings with which they connect the name of Moses. Further, they do not confine themselves to such mention of Moses as might merely indicate that he is the most prominent person of the times described in the writings; they explicitly attribute authorship to him: "Him of whom Moses . . . did write" (John i. 45), "For he wrote of me" (John v. 46), "For the hardness of your heart he wrote" (Mark x. 5), "If ye believe not his writings" (John v. 47), "The book of the law of the Lord by the hand of Moses" (2 Chron. xxxiv. 14), and very many similar passages. In Deuteronomy Moses is said to have written what is there called "the book of the law," xxxi. 9-13, 24-27. Many details are given as to the use to be made of this book of the law, and the

use actually made of it by Joshua (Josh. i. 7, 8, xxii. 5, viii. 34, 35, Deut. xvii. 18, 19). We are told that Joshua wrote in it, long after the death of Moses (Josh. xxiv. 25-28). There are mentioned a long list of items of sacred writing, by Moses or by Moses and Joshua, either in this book of the law, or additional to it, but in either case constituting a part of the present contents of the Hexateuch (Deut. xxxii. 44, etc., xxvii. 2-8, xxviii. 58-61, 69 [xxix. 1], xxix. 19, 20 [20, 21], xxx. 10, Num. xxxiii. 1-3, Ex. xxiv. 3-8, xxxiv. 27, xvii. 14, etc.). It is doubtless true that the phrase "book of the law" in these passages is not equivalent in meaning to the word Pentateuch; in some cases it indicates a short section only, and in at least one instance (Josh. xxiv. 26) it includes post-Mosaic writing done by Joshua; but the testimony is distinct to the fact of the production by Moses and Joshua of a large body of sacred literature, mostly identifiable with the contents of our present Hexateuch. This fact must be allowed to interpret what is said in the other books. Taken at its face value, we seem to have here nothing less than a continuous line of testimony from the times of Moses down.

Whether the fact thus testified to is really something less than that Moses wrote the Pentateuch, we will consider presently. It is at least beyond dispute that the testimony, as it stands, represents the written law of Moses, specifically including the Deuteronomic legislation, as in existence for centuries before Josiah, and in this flatly contradicts the main proposition of the critics who deny the Mosaic authorship. See for instance 2 Kings xiv. 6, cf. Deut. xxiv. 16. See also 1 Kings ii. 3, cf. Deut. xxix. 9; 1 Kings viii. 53, 56, 57, cf. Deut. *passim*; 1 Kings viii. 9, cf. Deut. x. 2, 5, and many like instances.

If this evidence will stand, it is by itself sufficient and decisive. Those who regard it as indecisive use mainly four arguments against it. First, they deny that the testimony means all that it is claimed to mean. Secondly, they claim that the texts which contain it are mixed and corrupt, so that they must first be sifted, often to the extent of entire reconstruction, before we accept their evidence. Thirdly, they say that the testimony in its present form, and largely in its more original forms, is the work of men who lived long after the alleged events, who failed to distinguish between stories and facts, who did not sift the information that came to them, who were deficient in the so-called historic sense, and were incorrect observers and reporters of events; and that the testimony must therefore be regarded as largely unhistorical. Fourthly, they say of the claims made in the Hexateuch itself, and of the parts of the testimony that stand or fall with these, that they are intentionally fictional—not necessarily untruthful, but a legal fiction devised for a purpose, and to be interpreted accordingly. These arguments, it will be observed, are capable of being so pushed as to antagonize one another. The men who use them use them in very unlike proportions, and in a spirit ranging from that of reverent devoutness to the extreme opposite.

1. There can be no doubt that the first of these arguments represents a logical process that is sometimes of great value. It is very often true that a statement does not mean all that we understand it to mean. Dr. Francis Brown has shown (*Journal of the Society of Biblical Literature and Exegesis*, 1882, p. 95) that the testimony of the New Testament to the authorship of the various books of the Old Testament do not go as far as many imagine, and that many passages commonly held to be explicit testimonies to authorship might possibly be otherwise understood, provided there be sufficient reasons against the common understanding of them. This process of minimizing the meaning of statements, to prevent conflict, is legitimate, in its own proper use. Nevertheless, the true law of evidence is that statements are to be understood in their natural meaning, except as de-

cisive reasons compel us to understand them as having less than their natural meaning. There is no dispute that the testimony in the case in hand, in the meaning it naturally conveys, attributes the responsible literary authorship of the Pentateuch to Moses. It is true that most of the statements in the Bible might possibly be understood to mean something less than this, provided there were sufficient proof that this cannot be their true meaning. But this possibility amounts to nothing unless such sufficient proof is forthcoming. This argument is entirely dependent on the question: What positive evidence is there that Moses is not the responsible author of the Pentateuch?

2. The argument from alleged mixture and corruption of texts mainly applies to the pre-exilic books of the Old Testament. In several of the more prominent of these books, they call upon us to accept the alleged fact that the book has been formed by piecing together writings that really belong centuries apart; they allege that we must first dissect the composite work into its original parts, before we take its testimony to matters of fact. In the process of dissection, as they perform it, most of the testimony to writings by Moses is assigned to the later documents that entered into the composite works, and is therefore regarded as untrustworthy. But there yet remain in the earlier documents and in other pre-exilic writings a considerable number of passages that testify to sacred literature written by Moses; these they dispose of by regarding them as interpolations—corruptions of the text. In other words, before we are permitted to take the testimony of these books to the matters of fact under consideration, we are expected to admit that the larger part of the literary work commonly assigned to Isaiah, Jeremiah, and the other later pre-exilic prophets, and substantially all that commonly assigned to the earlier men, Solomon, David, Nathan, Samuel, Joshua, Moses, for example, was written, not by these men, but by unknown scribes, obscure men, who made no mark on their own generation, and left no name to the generations that followed. Views like these are not credible, except upon strong evidence. That some one work should have the text-characteristics just mentioned would not be surprising, but it is difficult to believe that nearly the whole of a nation's literature is marked by these characteristics; it is easier to believe that almost any supposed criteria of composite structure are mistaken. It is not surprising if we find that some great man did not perform work that has been commonly attributed to him; or if we find that some obscure man has done great work; but when we are called upon to believe that throughout a nation's history the great men have done substantially nothing, and the nobodies have done everything, that is beyond the bounds of ordinary credibility. That these texts have been thus mixed and corrupted, to the extent and in the way required by the argument, is on the face of it very unlikely, and is not to be admitted except upon cogent evidence. And if the mixture and corruption of the text were admitted or proved, that would not prove that Moses is not the author of the Pentateuch; it would simply diminish the amount of the evidence of his being the author. The testimonies to his authorship would remain in existence, and would continue to have the character of a respectable tradition, and the question would still be: What positive evidence is there against this?

3. The same principles cover the argument from the alleged lack of historicity in the writings that contain the testimony. It is alleged that the testimony dates several centuries after the events, that it is not contemporary testimony, and is on that account of less value. The allegation depends entirely on the question of text-distribution which we have just considered. If we take the text as it stands, without rearranging it, the testimony begins in the time of Moses himself, and is continuous from that date. It is further urged that in the later times, and particularly in the times of

the New Testament, the witnesses may have thought of the Mosaic authorship as a matter of practical instruction and of received dogma, rather than of historical fact; but admitting this, it remains to be proved that they did not also regard it as a historical fact. Further, it is urged, especially in regard to the Old Testament narratives, that these, by their contradictions, by the nature of many of the statements they make, and by other marks, show themselves to be unhistorical. The principal alleged marks of this sort we will consider presently, in another connection. For the moment we content ourselves with noticing that the alleged unhistoricity of the testimony is not to be accepted without sufficient proof, and that it will take very cogent proof to be sufficient, and secondly, that if the proof were forthcoming, that would have no direct weight to show that Moses is not the author of the Pentateuch; it would only weaken the evidence of his being its author. The question would still be: What proof is there that he was not so?

4. The principles in hand still cover the argument from alleged unhistoricity, when the argument assumes the form of the fictional hypothesis. On the face of it there is no absurdity in supposing that Jewish statesmen of the times of Josiah and later might have given the literary form of a Mosaic tradition to laws codified by themselves. It is possible that such a fiction is morally defensible, and it is supposable that they might have done the thing, even if it were morally wrong. But if this fictional hypothesis be resorted to at all, it must be applied not to the testimony in the Hexateuch alone, but to much of that in the other books, both the pre-exilic and the post-exilic. If this fictional mode of describing the laws of Israel existed, it existed as consciously fictional for several centuries, covering several national revolutions, and we have a pretty abundant literature for those centuries. The absence of any distinct mention of it in that literature, as well as the difficulty of the thing itself, shows it to be quite improbable that it ever existed. In the circumstances, if the fictional hypothesis be affirmed, purely on the ground of its being necessary in order to explain the circumstance that Moses did not write the Pentateuch, that circumstance needs first to be established by sufficient proofs. Unless the proofs are forthcoming, the hypothesis amounts to absolutely nothing.

The difficulty of establishing the charge of lack of historical credibility, as against the testimony of the Old Testament, has of late years greatly increased. The outcome of recent excavations and explorations is altogether against it. As long as these books contained, in the main, the only known accounts of the events they mention, there was some plausibility in the theory that perhaps these accounts were written rather to teach moral lessons than to preserve an exact knowledge of events. It was easy to say that in those times men had not the historic sense. But the recent discoveries touch the events recorded in the Bible at very many different points, in many different generations, mentioning the same persons, countries, peoples, events that are mentioned in the Bible, and showing beyond question that these were strictly historic. The point is not that the discoveries confirm the correctness of the Biblical statements, though that is commonly the case, but that the discoveries show that the peoples of those ages had the historic sense, and specifically, that the Biblical narratives they touch are narratives of actual occurrences.

It is also a familiar and acknowledged fact that the general contents of the Hexateuch and most of the phenomena it presents agree with the account of its origin as given in the testimony, and thus confirm that account. There is no room here for details under this statement, though some instances will presently be given.

II. *Alleged Proofs of the Late Origin of the Hexateuch.*—By universal admission, then, we have an ac-

count of the origin of the Hexateuch, given by witnesses who seem to be trustworthy, and confirmed by a great body of testimonies and circumstances, with no testimony whatever against it. The presumption is that the account is true. This is not a merely technical presumption, but is of the nature of a very strong probability. If any one seeks to overthrow the result thus reached it ought to be not by conjectures, but by impregnable proofs. We turn to see what are the proofs offered in the case.

The critics who deny that Moses wrote the Pentateuch are accustomed to claim much on the ground of the superiority of their scientific methods. On the strength of this superiority of method they claim for themselves largely the authority of experts. They censure their opponents, and sometimes justly, for arguing from the assumed meaning of passages instead of the necessary meaning, for resorting to harmonistic conjectures for the removal of difficulties, and the like. Are their claims to scientific superiority so well based that we must accord to them something on this ground, and accept their opinions as the opinions of experts? To decide this let us examine a few specimens. We will take them just as they occur in the article in the *ENCYCLOPÆDIA BRITANNICA*.

"It was observed that Moses does not speak of himself in the first person, but that some other writer speaks of him in the third—a writer, too, who lived long after." But why should Moses be precluded from speaking of himself in the third person, just as Cæsar and Josephus do? And if it is another writer that speaks of Moses in the third person, he could do this as easily while Moses was living as "long after."

"The expression of Gen. xii. 6, 'the Canaanite was then in the land,' is spoken to readers who had long forgotten that a different nation from Israel had once occupied the Holy Land." Not necessarily. A reader of the times of Moses, or of any other time, might have a curiosity to know with what peoples, if any, Abraham and Jacob came into contact on reaching Palestine.

"Again, the 'Book of the wars of Jehovah' (Num. xxi. 14) cannot possibly be cited by Moses himself, as it contains a record of his own deeds." But there is nothing in the fact that a book mentions a man's deeds to prevent that man's citing the book.

"When Deut. xxxiv. 10 says that 'There arose not a prophet since in Israel like unto Moses,' the writer is necessarily one who looked back to Moses through a long series of later prophets." But this language would be very natural in the mouth of any old man who, in his youth, had known Moses. The inference that the writer must have looked back "through a long series" of prophets to Moses is gratuitous.

Absolutely these instances are representative. At this point any man of sense is competent to test the claims of this alleged scientific method. Whoever will take the trouble to look carefully at the instances of simple use of Biblical passages, in the article in the *BRITANNICA* and in the whole class of writings it represents, will thereafter find himself little disposed to place confidence in this class of writers as experts. No men are more in the habit than they of putting upon statements or upon phenomena the interpretation that will serve their turn, and then arguing as if this were the only possible interpretation.

It is by processes precisely like these that the attempt is made to invalidate the historicity of the Old Testament writings, and thus their testimony in the case in hand. Take a single instance for example. According to Gen. xvi. 16, xxi. 5, Ishmael was fourteen years old when Isaac was born. "But how does this accord with xxi. 9 *seq.*, where Ishmael appears not as a lad of seventeen but as a child at play (כְּצוּר, v. 9), who is laid on his mother's shoulder (v. 14), and when thrown down by her in her despair (v. 15) is quite unable to help himself? Similar inconsistencies appear, etc." But the statement that Ishmael "made

sport" is not a statement that he was then "a child at play." The narrative does not say that he was laid upon his mother's shoulder. When it is said that she "cast him under one of the shrubs" that does not imply that he was a baby and she had been carrying him. According to the account he was "quite unable to help himself," not by reason of tender age, but by reason of exhaustion. In all this there is no contradiction to what is elsewhere said concerning Ishmael.

It is true that if we are to understand the Biblical narratives as historical we must abandon the baby-story interpretation sometimes given to some of them, and we must interpret them by putting together all the known facts in each case and allowing the facts to limit one another. For the lack of care in these particulars the traditional understanding of the history is in some points open to criticism. Most of the difficulties will vanish if one merely put all the facts together, so as to obtain a complete understanding of the matter concerning which the difficulties arose, and most of the remaining difficulties are of the sort that would doubtless vanish if we knew more about the matter.

There is then nothing in the methods of these men to justify us in accepting their conclusions on the ground of their superior qualifications; all we have to do is to examine the evidence adduced to see what conclusions it justifies.

1. The simplest class of arguments for the late date of the Hexateuch is made up of the instances in which it is alleged that these writings mention or allude to events later than the times of Moses and Joshua. To understand the precise bearing of these instances we need to glance at certain facts connected with another name—that of Phinehas, the grandson of Aaron and grandnephew of Moses. Of Phinehas it is recorded that he was already in public life, and among the most prominent men of the nation, before the death of Moses. See Num. xxv. 7, 11; Ps. cvi. 30; Num. xxxi. 6. Next to Joshua himself he was the chief public man in Israel in the times of the conquest. See Josh. xxii. 13, 30, 31, 32; xxiv. 33. He was still high-priest in the time of the civil war with Benjamin, Jud. xx. 28. It follows that this war, the account of which is given Jud. xix.-xxi., was one of the earlier events of the times of the judges, instead of being the latest, as one might imagine from the place it occupies in the Book of Judges. That this war was itself preceded by the expedition in which the men of Dan captured Laish, in the north, is evident from the comparison of Jud. xvii., xviii., with Jud. xx. 1.

According to Jud. xx. 28, and the later notices, Phinehas was the successor of his father, Eleazar, in the high-priesthood. In this position he was the chief of the men to whom the custody of Moses' book of the law had been committed. If anything was done to the sacred writings of Moses and Joshua under his direction, it was done in the spirit of Moses and Joshua, within the lifetime of their personal associates. With these facts in mind, notice that the closing verses of the Book of Joshua bring the history up to the time of the death of Eleazar, the high-priest, and all that generation, that is up to the time when Phinehas of the next generation was already an old man. We shall presently find abundant proof that the earlier books of the Hexateuch, as well as its latest book, were either edited or annotated as late as the later years of Phinehas, and the question will become important whether there is any real evidence of redaction later than this. The instances are numerous and quite varied; we can notice only a few specimens in addition to those already cited.

The instances in which the proper name Dan is mentioned belong, of course, to a date after Laish had been captured and named Dan, Jud. xviii. 29, etc.; but this, as we have seen, was within the lifetime of Phinehas. The instances are Josh. xix. 47; Deut. xxxiv. 1; Gen. xiv. 14. The last may possibly be on

a somewhat different footing from the other two. The account of the death of Moses, Deut. xxxiv. 6, 10, with the phrase "unto this day," the account of Og's bedstead, and of the name Havvoth-Jair, with the same phrase, Deut. iii. 10-15, the account of the Gibeonite tabernacle service, with the same phrase, Josh. ix. 27, and all parallel cases come under the same general statement. In some of the instances the phrase would be peculiar if assigned to the times of Moses, but in every instance it is entirely natural for some date not later than the times of Phinehas. If "Luz which is in the land of Canaan," Gen. xxxv. 6; Jud. i. 26, be understood as distinguishing the Palestinian Luz from the Luz afterward built in the land of the Hittites, then the phrase is later than the times of Moses, but not later than Phinehas. But it is not necessary to understand this phrase as post-Mosaic.

About sixty instances occur in Genesis, Exodus, Numbers, Deuteronomy, and Joshua of the names Hebron, Bethel, Debir, and Hormah, proving that these narratives were not written in their present form till after the adoption of these names instead of Kirjath-arba, Luz, Kirjath-sepher, and Zephath. But it is alleged that the change of name in each case occurred after the death of Moses, Jud. i. 10, 11, 17, 23. But in these cases it does not follow that the old name became extinct as soon as the new name was given. Prof. E. H. Palmer holds that the name Zephath is still in existence in the Arabic name Sebaita. See Palmer's *Desert of the Exodus*, p. 236, et al. Again, there is nothing improbable in the idea that the new name given after the conquest was the renewal of a Hebrew name previously given; the Biblical accounts give us to understand that this was actually the case with the name Bethel. In short, these instances have no great weight to prove that the passages where they occur contain anything later than Moses, and no weight at all to prove anything later than Phinehas.

No instances are more generally conceded to be of late origin than the law concerning the Israelite king, Deut. xvii. 14-20, and the passage concerning the Edomite kings, Gen. xxxvi., especially v. 31. But Moses needed no prophetic insight, but only ordinary human sagacity, to see that the Israelites were likely at some time to wish to establish monarchy, so that this was a case to be provided for. Further, according to the record, Moses held that Jehovah had made a promise, according to which a line of kings was to come from the loins of Abraham, Sarah, and Jacob, Gen. xvii. 6, 16; xxxv. 11. This being the case, there is no improbability in the idea of Moses giving such a law as the one in Deuteronomy. And this being admitted, this man who was looking forward to the existence of kings in Israel, and whose only interest in Edom lay in the fact that Esau was the elder brother of Israel, might very naturally mention the circumstance that there were as yet no kings in Israel, though the Edomites had already had kings for some generations. Until light can be thrown on the dates of the Edomite kings actually mentioned in this chapter, it cannot be shown that anything in the chapter is of a later date than Phinehas, or even than Moses.

If it be admitted that Ex. xvi. was written after the manna ceased (vs. 31, 35), that is, after the death of Moses (Josh. v. 12), and for a generation who had not seen the manna, and needed to have it described to them, that would not date the chapter later than Phinehas. The minuteness of the description does not indicate lateness of date; nothing is more common than for men to write careful descriptions of wonderful contemporary events for the information of coming generations.

The expression, "as Israel has done to the land of his possession," Deut. ii. 12, may easily be understood as referring to the conquest and division of the country east of the Jordan, and may therefore be the language of Moses himself. And even one who refers

this language to the conquests west of the Jordan can give no good reason for dating it later than the time of Phinehas. The phrase "within thy gates" (Ex. xx. 10, and elsewhere), and the law against removing landmarks (Deut. xix. 14) need not be regarded as post-Mosaic, for they apply to a people who have been settled and expect to settle again, as well as to a people actually settled when the law was put into the code. There is no reason for saying that "the mountain of Jehovah" (Gen. xxii. 14) presupposes Solomon's temple, or that "return to Egypt in ships" (Deut. xxviii. 68) is a reference to Jer. xliii. 7, or to anything else than the familiar fact that Egypt, before the times of Moses, already had a maritime slave-trade.

Especial stress has been laid, in certain quarters, on the words used in the Hexateuch to indicate the points of the compass—"seaward" for westward, Gen. xii. 8, and fifteen other places; toward the "Negeb" for southward, Ex. xxvi. 18; xxvii. 9, and many other places; "across the Jordan" for east of the Jordan, Deut. i. 1, and many other places. But these instances merely show that these parts of the *usus loquendi* of the Hebrew language originated north of the Negeb, and west of the Jordan; the allegation that they also show where the writer of these particular passages was located when he wrote is untenable. From the days of the patriarchs until now, you could not locate a man on any square yard of ground on the face of the earth where it would be inappropriate for him to say "across the Jordan," designating thereby the country east of the Jordan. We do not here need to say that Phinehas may have written these passages from his home west of the Jordan, for the use of these established geographical phrases affords no evidence of their having been written in one locality rather than another.

We add but a single instance. The Book of Jashar is cited in Josh. x. 12, 13. But some composition of David's was apparently written in the Book of Jashar (2 Sam. i. 18). If therefore the Book of Jashar was a work produced at some one date, that date was as late as David, and we have here at least one passage some centuries later than Moses and Joshua. If this view be accepted, a single gloss like this is not very important. But even in this case it is not necessary to accept the late date. The Book of Jashar, instead of being compiled at one time, may have been a collection that gradually accumulated from generation to generation; it may have received its name as early as Joshua's time, while additions continued to be made to it till David's time and later.

The instances thus far treated probably number not less than two hundred. The list could be greatly extended, but could hardly be made to include anything that would change its character as evidence. Evidently, most of the instances might be explained as having been written centuries later than Moses, provided there were proof that they ought to be so explained; but on the other hand, it is equally evident that most of them may supposably have been written by Moses himself, and that not one of them necessarily dates later than Phinehas.

This being the state of things, the argument from these instances in favor of the early date of these writings is not merely negative but positive. Historians are apt to compare the events they directly narrate with later events, up to their own times. Josephus, for example, speaking of Moses in Egypt, is led to mention that the city which he says Moses besieged was afterward called Meroe by Cambyses, and also to mention that the Greeks of his own time were familiar with the Egyptian ibis, *Antiquities*, II., x. 2. What Josephus thus does is what narrators are accustomed to do. It is quite prominently done in the Hexateuchal narratives of the times before Moses, and somewhat less prominently in those of the times of Moses and Joshua. They use the proper names that belong to the times of Moses and

later, up to the time when Laish was named Dan. When they speak of the birth of Moab and Ben-ammi, or of the oath at Beer-sheba, or of the shrinking of Jacob's thigh, or of the monument to Rachel, or of the laws made by Joseph in Egypt, they mention that "unto this day," there was in existence a people, or a proper name, or a monument, or a usage, connected with the event they narrate, Gen. xix. 37, 38; xxvi. 33; xxxii. 32; xxxv. 20; xlvii. 26. In their account of what occurred in the times of Moses and Joshua they do the same, Deut. iii. 14; xxxiv. 6, 10; Josh. iv. 9; v. 9; vi. 25; vii. 26; viii. 28, 29; ix. 27; x. 14, 27; xiii. 13, etc. To their account of the original giving of the manna they add a circumstance connected with the ceasing of the manna, some forty years later, Ex. xvi. 31, 35. This being their habit, how are we to account for it that no unmistakable allusion to any event later than the lifetime of Phinehas appears in these writings? The natural explanation is that that lifetime marks the date of the completing of the writings, and this explanation is thoroughly in accord with all the evidence we have thus far considered.

2. Another class of arguments to prove the late date of the Hexateuch proceeds on the assumption that certain principles of evolution apply in this case. This assumption is sometimes avowed, and it is actually one of the premises of the reasoning of some who do not avow it. It is assumed, for example, that the condition of the Israelites in early times was extremely barbarous and illiterate, so that such a literature as this was then impossible, and that it became possible by a process of development in civilization. But (to say nothing of the possibility that divine inspiration might produce authorship even among a rude people) we now know that there was a widely extended literature, in several languages, in Egypt, Syria, and Mesopotamia, before the time when Moses is said to have led the Israelites from Egypt. Prof. Osgood (in *Essays on the Pentateuch*, No. 12) has admirably summarized the testimony of recent investigators on this point, and at the present moment the work being done on the collection of Syria and Mesopotamian tablets found in the archives of Amenophis III. and Amenophis IV. of Egypt, is here adding fresh confirmation. See accounts of this "find" with references to additional sources of information, by A. H. Sayce, in the *Independent* of June 28, 1888, and by Dr. Francis Brown, in the *Presbyterian Review* of July, 1888.

Again, it is assumed that the law of development of religion requires that we should hold that the religion of Israel existed in the form of polytheism, then in the form of a relatively gross monotheism, and afterward in that of the higher monotheism represented by the prophets, all these being stages that must have preceded the ritualism found in the priestly law. Hence it is argued that the law could not have come into existence till after the writing of the books of the pre-exilic prophets. This reasoning has been sufficiently met by many writers, among others by Dr. Gardiner and Dr. Dwinell, *Essays on the Pentateuch*, Nos. 2 and 9, but it is very summarily met by Dr. Osgood, in the essay just cited, by the well-attested fact that an elaborate ritualism actually existed before the times of Moses, both in the regions whence the Israelites are said originally to have come, and in Egypt, where they made their long sojourn.

3. In proof of the late date of the Hexateuchal writings it is urged that they have virtually the same linguistic character with the latest books of the Old Testament, which could hardly be the case if they were written a thousand years the earlier. In reply to this, Dr. Franz Delitzsch (see articles of Dr. S. I. Curtiss in the *Hebrew Student* for March, April, May, and June, 1882; and in the *Presbyterian Review* for July, 1882) holds, first, that the range of linguistic changes is much less in the Shemitic than in the Western languages; secondly, that many of the lin-

guistic differences that once existed may be presumed to have vanished in the process of transferring the books from the old alphabet to the square alphabet; and thirdly, that, notwithstanding these facts, the differences now actually existing are quite appreciable. This has always been a correct and sufficient reply. Some of these linguistic differences are treated in the latest editions of Gesenius' *Grammar*, particularly in the treatment of the pronouns, and in Harman's *Introduction*, chap. x., and indeed in most Commentaries and Introductions that treat of the Pentateuch. The fact is that the Hexateuch, the later pre-exilic books, and the post-exilic books, each present characteristic peculiarities of vocabulary, of verbal form, and of syntax, and that the Hexateuchal peculiarities are largely those which are naturally to be assigned to the earlier stages of a language.

4. In pretty sharp contradiction with the argument just considered, though frequently urged by the same men, is the argument that the differences of style between different parts of the Hexateuch are such as to show that the passages must be by different authors, apparently living in different historical periods. The fact that there are in the Hexateuch great linguistic and rhetorical diversities is admitted. Considering the variety of subjects here treated, the variety of method of treatment, and the variety of the experiences that are said to have entered into the life of Moses, who would here expect anything else than great diversities of style, even if he supposed that Moses wrote every word of the Pentateuch? And if Moses and Joshua made use of works by earlier writers, employed secretaries, and left the writings to be edited by their immediate successors, we have additional explanations for this class of phenomena. The phenomena, in this way of looking at them, have no weight against the idea that Moses and Joshua are the proper authors of the Hexateuch.

5. This argument, however, recurs in the more specific and elaborate form of what is now currently called "the Pentateuchal Analysis." Work done in this analysis, and discussion concerning it, form the bulk of the contents of recent works and articles on the Pentateuch, but this subject is so fully treated in the *BRITANNICA* article, that there is no need of giving much space to it here, even for the sake of presenting a different view. Those who accept the so-called "analysis" are pretty well agreed in holding that the Hexateuch is a compilation from four previous compilations. These are now most commonly described as J, E, D, and P; that is, the works of the Jehovist narrator, the Elohist narrator, the Deuteronomist, and the Priestly narrator. They are pretty well agreed as to the present limits of P and D, and in the opinion that the main part of D was written in connection with the reform under king Josiah. They differ as to the dates of the other three documents, as to the dividing line between J and E, as to which parts of D belong to the original Deuteronomist, and which parts to each of a series of supplementary Deuteronomists, as to which parts of P are by the proper priestly narrator, and which parts by each of a supposed series of supplementary priest-scribes, as to the earlier writings that were incorporated into each of the four documents, and as to the multitude of other questions that arise.

It is readily seen that every theory of this sort is a complicated structure, built on no other foundation than conjectural explanations of circumstantial evidence, beset with difficulties that can be removed only by hypotheses framed for the purpose. The mere testimony in the case, as understood by those who hold the modified traditional view, will doubtless explain as many of the phenomena as can be explained by any of these more complex theories; and the explanation by testimony is of course to be preferred to the explanation by hypothesis. It follows that, notwithstanding the great weight of scholarly opinion now arrayed in favor of the various forms of what is our-

rently called the Pentateuchal analysis, men who think for themselves are yet justifiable in hesitating to accept it. The nature of the arguments commonly urged against it may be learned by consulting the volumes named at the close of this article.

But supposing the current Pentateuchal analysis were accepted, so far as it pertains to the literary form and the mode of composition of these writings, it would by no means follow that we are compelled to accept the alleged late dates of the several parts of the Hexateuch. All the different literary processes involved may as well have been performed in the times of Moses, or before him, or after him within the lifetime of men who were associated with him, as at any later period. That the times of Josiah and Jeremiah were times when the Deuteronomic law-book was closely studied is very evident. It has been alleged in addition to this that the Deuteronomic legislation bears marks of having been made in those times and for those times. This is sufficiently refuted by Dr. Bissell and others. Similar claims are made, and are refuted by the same authors, as to the special affiliations between the priestly legislation and the times of Ezra and Nehemiah. A great deal has been made by some writers of the alleged absence of Egyptian elements from the Hexateuch, and the presence there of Babylonian elements; but, at present, no respectable scholar would allege that Egyptian elements are wanting, and the Babylonian elements may be readily explained by the known facts as to early relations between Egypt and Babylonia. The "find" described in the articles of Profs. Sayce and Brown, in the *Independent* of June 28, 1888, and the *Presbyterian Review* of July, 1888, is rich in material of this sort. It is further asserted that the Book of Ezekiel presupposes parts of the Hexateuch, but is in turn presupposed by most of the priestly legislation; and it is hence inferred that the priest-code is later than Ezekiel. This has been most satisfactorily refuted by Dr. Frederic Gardiner, in the *Journal of the Society of Biblical Literature and Exegesis*, 1881.

6. The argument that is regarded as strongest of all, in connection with the Pentateuchal analysis, to prove the late date of the successive parts of these writings, is the alleged silence of the Books of Judges and Samuel, both in regard to the Mosaic writings and in regard to the institutions described in them, combined with the alleged testimony of these books and the Books of Kings to the existence of institutions inconsistent with those of the Pentateuch. This argument is spread out into a great variety of specifications; it is impossible here to do more than mention a few of the most prominent. It is alleged that the Books of Judges and Samuel do not mention the *Torah*. The fact is that they use the noun *Torah* in 2 Sam. vii. 14, and the cognate verb, in the same sense with the noun, in Jud. xiii. 8 and 1 Sam. xii. 23. It is alleged that these books never cite the Hexateuch. It is true that they never use the formulas of citation, like those used in the Books of Kings and Chronicles, and in the New Testament; but they presuppose the events and the institutions described in the Hexateuchal writings, and abound in what seem to be verbal citations from them. A few out of very many apparent instances of verbal citation—instances in which the meaning depends upon the fact that the phrases are citations—are those in 2 Sam. vii. 1, 12, 24; 1 Sam. viii. 3, 5; Jud. xi. 14-27, ii. 1-3. Indeed, there is now a strong tendency among the advocates of the Hexateuchal analysis entirely to give up this allegation, and adopt an opposite view, namely, that the Books of Judges and Samuel are composite productions, formed from continuations of the same documents from which the Hexateuch was formed, and are therefore of a correspondingly late date.

It is alleged that these books are entirely silent as to the Pentateuchal system of institutions. This allegation, however, is materially modified by two admis-

sions. First, the allegation is not quite true as the text of these books now stands; the silence does not exist until the text has first been corrected and certain passages that break the silence (e. g., 1 Sam. ii. 22) omitted as interpolations. Secondly, it is admitted that these books mention many particular institutions that belong to the Pentateuchal system. In replying to this and to several of the following allegations it should be conceded that, so far as appears from the evidence, the Pentateuchal system, if it existed during the period from the death of Joshua to the later years of David, was then in very imperfect operation. But the failure to enforce the law in those times neither implies that the law was then non-existent nor that it was then unwritten. Meanwhile the passages that presuppose institutions described in the Pentateuch are too numerous, too explicit, and too varied to be consistent with the allegation that the books are silent on this subject. Among the Pentateuchal institutions mentioned are the functions of the *Goel*, 2 Sam. iii. 27; xiv. 11; certain parts of the law of the Nazirite, Jud. xiii. 5; 1 Sam. i. 11; the prohibition of foreign gods, 1 Sam. vii. 3, etc.; usages respecting ceremonial cleanness, uncleanness, and holiness, 1 Sam. xx. 26; xxi. 5; religious laws against the eating of blood, 1 Sam. xiv. 32-34; against witchcraft, 1 Sam. xv. 23; xxviii., etc.; the priestly character of the Levites, Jud. xvii., etc.; the carrying of the ark by men, 2 Sam. vi. 13, and context; the burning of the fat before the priest's fee was due, 1 Sam. ii. 16 (cf. Lev. vii. 29-34); the offering of meal and wine with an animal victim, 1 Sam. i. 24; the technical terms *קִנְיָהּ* *וְהִקְנִי*, 1 Sam. iii. 14; the distinction of burnt-offerings, peace-offerings, etc., 1 Sam. x. 8; xiii. 9, *et al.*; sacrifices connected with vows, 1 Sam. i. 21; sacrifices for certain seasons distinguished from particular sacrifices, 1 Sam. i. 21; the shewbread, 1 Sam. xxi. 6; the high-priest's ephod, 1 Sam. ii. 28, *et al.*; the sanctuary tent and the sacred ark, 1 Sam. ii. 22; 2 Sam. vi., *et al.*; the service of the sanctuary by priests descended from Aaron, 1 Sam. ii. 28, and many places; its being for "all Israel," ii. 14, 22, 24, 28; iii. 20, *et al.*; at least one annual festival, with sacrifices peculiar to it, to which Israel came up, 1 Sam. i. 3, 7, 9, 21; ii. 19, etc.; eating and drinking in Shiloh (before the LORD), as a part of the celebration of the festival, vs. 7, 9; in fine, the existence of rigid ceremonial laws, which it was a sin to neglect, 1 Sam. ii. 29; xiii. 11-13; 2 Sam. vi. 7, etc. The list might be greatly extended. Certainly, these books mention the Levitical laws and the other Pentateuchal institutions as fully as any one has a right to expect on the supposition that these were then already in existence. Their silence, therefore, in regard to other particulars has no weight to prove that the laws were then non-existent.

But it is alleged that in many of the instances given, and in other like instances, the details described in these books are different from those described in the Pentateuch, and that this fact proves the Pentateuchal description to have been then non-existent. The fact alleged is in part admitted, but the inference of wholly denied. The cultus described in the Book of Nehemiah includes many details that vary from those of the Pentateuch; for example, the pulpit for the reading of the law, the processional services, the tax of a third of a shekel, the wood-offering. The ritual of the scribes included the sacrifice of the cock, the pouring of water and the use of citrons at the feast of tabernacles, the ceremonies for receiving proselytes. No one claims that these variations prove that the written law was in their time non-existent, and there is no more ground for such a claim in the variations of the times of Samuel. It is further alleged, however, that the institutions described for the times of the judges, and for the later times, up to the reign of Josiah, are not only variant from those described in the Pentateuch, but are inconsistent with

them. The strongest alleged fact of this kind is that the law in Deut. xii. forbids sacrifices to Jehovah, except at a central sanctuary, while in the times of Gideon, of Jephthah, of Samuel, of David, of Elijah, it is represented to have been orthodox to sacrifice at a great number of different sanctuaries. For details under this argument and the reply to it the reader is referred to books on the subject, and to the article **TABERNACLE** in this work. In general the reply is that in many of the alleged instances the sacrifice spoken of is to be regarded as illegal, so that these instances do not count in the argument. The remaining instances may all be referred to one of three classes: Either they were merely private sacrifices, such as are explicitly provided for in the law itself (Deut. xii. 15, 21, where the verb is *זָבַח*, or they may have been in the presence of the ark, and therefore properly at the one central sanctuary, the sanctuary itself being movable till the building of Solomon's temple, or they occurred in circumstances when Israel was not, within the meaning of the law, at "rest from all his enemies round about" (Deut. xii. 10), and was without the place chosen by Jehovah "to put his name there" (Deut. xii. 5)—that is, in circumstances when the law was necessarily in abeyance.

Similar arguments drawn from the statements of the several books concerning the priesthood, from those concerning the three annual festivals, and from those concerning various other matters, are drawn out at length, and refuted at length, in the different works on these subjects. The results of the discussion may be fairly summed up in the proposition that the Books of Judges and Samuel, like those of Kings, mention and in other ways clearly presuppose earlier sacred writings containing wholly or in part the same contents with our Hexateuch. They mention these writings and the events and institutions described in them as fully as could fairly be expected on the supposition that the writings date from the times of Moses and his immediate successors. The institutions they mention are either mentioned with disapproval, expressed or fairly implied, or are institutions consistent with the Pentateuchal laws.

Literature.—The literature on this subject is immensely voluminous. Reference may be made to the following: R. P. Stebbins, D. D., *A Study of the Pentateuch* (Boston, 1881); Henry M. Harman, D. D., *Introduction to the Study of the Holy Scriptures* (New York, 1884); of this work pp. 66-270 are devoted to the Hexateuch; *Essays on Pentateuchal Criticism by Various Writers* (New York, 1888). A compact presentation of the history of Pentateuchal criticism is given by Dr. C. A. Briggs in the *Presbyterian Review* for January, 1883.

The views of the dominant school of the advocates of the late date of the Hexateuch are to be found, of course, in the writings of Graf, Robertson Smith, Kuenen, Wellhausen, Kayser, Stade, etc. Probably the best one book of this sort accessible to English readers is *The Hexateuch*, by Kuenen, translated by P. H. Wicksted (London, 1886). Good, compact statements of the views of men of this school are given in several of the works written in refutation of them and mentioned in these notes. That given in Dr. Green's little book on the *Hebrew Feasts* is sufficient.

Dillman, Nöldeke, and Schrader are good representatives of the school of critics who accept mainly the so-called Pentateuchal analysis, but deny the post-exilic origin of the priest code. A good summary is given in the "Introductory Preface" of *The Cuneiform Inscriptions and the Old Testament*, by Schrader (Berlin, 1882), and English translation by Whitehouse (London, 1885).

Perhaps the most complete single work attacking the "Pentateuchal analysis" and the destructive arguments based upon it is *The Pentateuch, its Origin and Structure*, by Dr. E. C. Bissell (New York, 1885). Dr. W. H. Green has assailed the analysis itself, and some of the consequences drawn from it, in *Moses and the Prophets*, and in *The Hebrew Feasts*, and in his series of comments on the International Sunday-School Lessons, published in the *Sunday-School Times*.

The article "Pentateuch" in the Schaff-Herzog *Encyclopædia* gives a relatively full list of the literature of this subject. Other lists are found in the works to which we

have referred and in the various commentaries, introductions, and articles. Dr. Bissell's list has about 2000 titles. The list of works on Exodus given by Dr. Francis Brown in the *Old Testament Student* for November, 1886, with brief comments on some of the works mentioned, covers nine large pages.

In *Hebraica*, July, 1888, is an article on "Pentateuchal Analysis," by B. W. Bacon, which mentions the literature and tabulates the views held by the reconstructive critics up to date. A discussion of the whole question, by Prof. Wm. R. Harper and Prof. Wm. H. Green, is promised in the same magazine. (W. J. B.)

PENTECOST. See **TABERNACLE**.

PEORIA, a city of Illinois, county-seat of Peoria co., is on the W. bank of the Illinois River, at the outlet of Peoria Lake, 157 miles S.W. of Chicago. It is on a plateau surrounded by bluffs rising 180 ft. above the lake and nearly a mile distant. It is an important railroad centre, eleven roads already crossing or terminating here. These connect it with Chicago, Cincinnati, St. Louis, and other prominent cities. The Union Depot furnishes accommodation for eight of the railroads. By the Illinois River also Peoria has communication with the Mississippi and by the Illinois and Michigan Canal with the Great Lakes. Peoria has a stone court-house, a U. S. government building, city-hall, jail, and workhouse. Of its ten parks the largest is Jefferson, with 35 acres. There are 45 churches, the finest of which are the Roman Catholic Cathedral, the Congregational, Calvary Presbyterian, First Methodist, and the Universalist Church. Besides the high-school there are 12 public school buildings, several church and private schools, a German free school, business colleges, a free public library, a law library, a college of physicians and surgeons, and a scientific association. The police and fire departments are efficient. The city is lighted with gas and electricity, and is provided with water by the Holly system. The street-car lines operate 10½ miles of double track. There are three hospitals, the Bradley Home for Aged Women, and the Home of the Friendless. Peoria has 6 national, 2 private, and 2 savings banks, 7 daily and 7 weekly newspapers, 5 being German. The leading manufacture is distilling, in which Peoria surpasses all other cities in the United States. In 1885 there were produced 18,602,992 gallons of spirits, consuming 49,185,389 bushels of grain. The other manufactures comprise agricultural implements, beer, watches, stoves, starch, glucose, flour, oatmeal, and pottery. The grain-elevators have a total capacity of 2,700,000 bushels. In the lower part of the city are large stockyards through which 350,000 animals passed in 1886. Peoria is surrounded with fertile, undulating prairies, which contain mines of bituminous coal. In the city water impregnated with sulphur is obtained by artesian wells and largely used for medicinal purposes. Peoria was made a trading-post by La Salle in 1680, and a settlement here was called La Ville de Mallet. Afterwards Fort Clark occupied the site, and in 1819 Peoria was founded. Its population in 1870 was 22,849 and in 1880 had increased to 29,315, but on the basis of the city directory of 1886 (containing 16,520 names) it is estimated at 50,000.

PEPPERELL, SIR WILLIAM (1696-1759), was born at Kittery Point, Maine, June 27, 1696. The son of a fisherman of Welsh descent, he became a wealthy merchant, and in 1727 was elected a member of the Council of Massachusetts. In 1745 he was appointed to command the New England expedition against Louisbourg, and in less than eight weeks captured this fortress, June 17. This exploit won for him a baronetage and in 1749 a colonelcy in the British army. He was acting governor of Massachusetts 1756-58, and was made lieutenant-general shortly before his death, July 6, 1759. His grandson, William Pepperell Sparhawk, who succeeded to his title and estates in 1774, soon lost them by his adherence to the British cause. He died in London Dec. 17, 1816.

PEQUOTS, or **PEQUODS**, an Indian tribe of the

Algonkin family, at the time of the settlement of Connecticut were found around the Thames River. They were a branch of the Mohegans and were noted as warriors. They acquired a supremacy among the native tribes and made treaties with the Dutch and English. Gov. Endicott, however, thought it necessary to send an expedition among them, and thenceforward they were hostile to the whites. In May, 1637, Capt. John Mason, being sent against them from Hartford, surprised and burned their fort near Groton. Several hundred men, women, and children perished, but the rest of the tribe continued the war until they were overpowered in Fairfield swamp. Many of them were sold as slaves in the West Indies, others were scattered among neighboring tribes, yet a remnant was finally gathered and recognized by law. They lived partly at Ledyard and partly at North Stonington. In later wars they assisted the colonists. Some of them removed to Oneida co., N. Y., and thence to Green Bay, Wisconsin.

PERCH, a well-known game-fish, which is very common in the rivers of North America, Europe, and Northern Asia. It is a member of the *Percide*, an extensive family of acanthopterygious fishes. The perch has an elongated body, covered with ctenoid scales, with two dorsal fins, the first having 13 or 14 spines, the second being flexible, while the anal fin is small and far back, and the ventrals thoracic, each with one spine and five rays. The skeleton has more than 24 vertebrae. All the teeth are villiform, without canines, occurring on the palatine bones and the vomer, the tongue being toothless. There have been 14 species of perch described, all inhabiting fresh water. Of these the American yellow perch (*Perca flavescens*) is generally held to be the only true species in the United States. It is very widely distributed in the lakes, ponds, and streams of the Middle and Northern States and the British provinces, is easily taken by hook or net, and is considered an excellent table-fish. This species is ordinarily below 10 in. in length, but is occasionally found of 12 to 15 in. in length and 2½ lbs. weight. It is of a greenish yellow color on the back and golden yellow on the sides, the back being banded with 6 to 8 transverse dark bands. The under parts are white, the dorsal and caudal fins greenish brown; the pectorals, ventrals, and anal golden orange; the body compressed and elongated, with the lateral line concurrent with the line of the back.

As a game-fish the perch is a bold biter and may be taken with worm or small fish, affording fair sport, but requiring no great skill in its capture. It is a favorite fish with rural anglers, and is esteemed a great delicacy in the interior regions where sea-fish are not easily obtained. The European yellow perch (*P. fluviatilis*) is generally distributed in Europe and Northern Asia. It resembles *P. flavescens* in coloration, bites well, and is very tenacious of life out of water. Its flesh is considered excellent. It frequents still waters, sometimes descending into brackish, attains in rare cases a weight of 5 pounds, and is exceedingly prolific, more than 1,000,000 eggs being borne in one spawn.

There are several other fish which are commonly called perch, such as *Corvina oscula*, the white perch of the Ohio, and *Pimotus vulgaris*, the bream, to which is often given the name of pond perch. Some sea-fish of the genus *Serranus* are also known as perches. There are 26 species in all of these, many of them handsome fish, abundant in the warmer seas. The common American salt-water perch, plentiful around the rocky shores of New England, is *Ctenolabrus caeruleus*. This fish has an elongated, scaly body, varying in length from 6 to 10 in. and deviating considerably in color. It has a single dorsal fin with strong and piercingly sharp spines, and is an excellent table-fish. Great numbers are caught in nets or by hook, and are kept alive in large floating cars until

needed for market. It is a favorite fish with the anglers of those shores. (C. M.)

PERKINS, CHARLES CALLAHAN (1823-1886), artist, was born at Boston, March 1, 1823. He graduated at Harvard in 1843, and went to Rome, and afterwards to Paris, where he studied painting under Ary Scheffer. During other visits to Europe he studied etching, which he used in illustrating his works on Italian art. His life was devoted to promoting the culture of the fine arts, especially in Boston, where he assisted in founding the museum for that purpose. From 1869 to 1879 he was president of the Boston art club, and from 1875 to 1886 of the Handel and Haydn society. He was accidentally killed by the overturning of a carriage at Windsor, Vt., Aug. 25, 1886. Besides delivering many lectures, Perkins published *Tuscan Sculptors* (2 vols., 1864); *Italian Sculptors* (1868); *Raphael and Michelangelo* (1878); *Sepulchral Monuments in Italy* (1883); *Historical Handbook of Italian Sculptors* (1883).

PERKINS, JUSTIN (1805-1869), an American missionary, was born at West Springfield, Mass., March 12, 1805. He graduated at Amherst College in 1829, and after studying theology at Andover was sent to Persia in 1833 by the American Board of Commissioners of Foreign Missions. He established himself at Oroomiah and labored especially among the Nestorians, into whose language he translated the Bible and several other works. In 1842 he returned to the United States, bringing the Nestorian bishop, Mar Yohanan. After another visit in 1848 he finally returned in 1869, and died at Chicopee, Mass., on the last day of that year. In English he published *Eight Years in Persia* (1843), and *Missionary Life in Persia* (1861).

PERKINS, THOMAS HANDASYD (1764-1854), merchant and philanthropist, was born at Boston, Mass., Dec. 15, 1764. He engaged in the East India trade, and, having acquired great wealth, retired from business in 1823. He was for many years a member of the State Legislature, and in later life was a liberal contributor to the Mercantile Library, the Massachusetts General Hospital, the Boston Athenæum, and other public enterprises. In 1827 he projected the Quincy Railway, the first built in the United States. He was active in promoting the erection of the Bunker Hill Monument. He gave his mansion on Pearl Street as an asylum for the blind (see **BLIND**). He died at Boston, Jan. 11, 1854.

His nephew, **JAMES HANDASYD PERKINS** (1810-1849), after being a clerk in his counting-room, settled at Cincinnati in 1832, and was successively lawyer, editor, and Unitarian minister. He was president of the Cincinnati Historical Society and published *Annals of the West* (1847).

PEROWNE, JOHN JAMES STEWART, an English clergyman, was born at Burdwan, Bengal, March 13, 1823. He is of French Huguenot descent, and was educated at Norwich Grammar School and at Corpus Christi College, Cambridge. He graduated B. A. in 1845 and M. A. in 1848, having won several prizes by scholarship. He was elected a Fellow of his college in 1849, and was select preacher to the University in 1853, and later years. He was also professor in King's College, London, and assistant preacher at Lincoln's Inn. In 1862 he was made vice-principal of St. David's College, Lampeter, and held that position ten years. In 1873 he was made a Fellow of Trinity College and in 1875 Hulsean professor of divinity at Cambridge. In 1878 he was made dean of Peterborough. From 1870 to 1884 he assisted in the revision of the English Old Testament, and he is editor of the *Cambridge Bible for Schools* (1877, sqq.). He published *The Book of Psalms, a New Translation, with Notes* (2 vols., 1864-68); *Hulsean Lectures on Immortality* (1869) and some sermons, besides contributions to various periodicals.

PERROT, GEORGE, French archæologist, was born at Villeneuve St. Georges, Seine-Oise, Nov. 12, 1832.

He was educated at the Normal School in Paris, and at the French School at Athens. In 1861 he undertook archaeological exploration in Asia Minor, and soon discovered an important monument at Ancyra. In 1872 he was made professor of Greek in the Normal School, and in 1877 professor of archaeology in the University of Paris. His publications comprise *Exploration archéologique de la Galatie et de la Bithynie* (1863-73); *L'île de Thasos* (1864); *Essai sur le Droit public et privé de la République athenienne* (1867). With Charles Chipiez he published *Histoire de l'Art dans l'antiquité* (4 vols., 1881-4). Vol. I. of this valuable work treats of Egypt; Vol. II. of Assyria, Babylonia, and Chaldaea; Vol. III. of Phœnicia and Syria; and Vol. IV. of Asia Minor and Cyprus.

PERRY, MATTHEW CALBRAITH (1794-1858), commodore, was born at Newport, R. I., April 10, 1794. His father, CHRISTOPHER RAYMOND PERRY (1760-1818), served with distinction in the Revolutionary navy, and when the navy was reduced to insignificance was made collector of Newport. His five sons all served in the navy and were distinguished in the war of 1812. Matthew had been appointed a midshipman in 1809 and became lieutenant in 1813. In 1819 he selected the locality for the first settlement of Liberia under the auspices of the American Colonization Society. He afterwards cruised in the West Indies, then infested with pirates. He promoted the introduction of steam as a motive power in the navy. After commanding various squadrons he was engaged in the war with Mexico, and took part in the siege of Vera Cruz. His most memorable work was the expedition to Japan in which he negotiated, March 21, 1854, the treaty which opened that empire to western civilization. The narrative of the expedition was edited from his notes by Rev. F. L. Hawks and George Jones (3 vols., 1856). He died at New York, March 4, 1858. A bronze statue has been erected to his memory in Truro Park, Newport. His *Life* has been written by W. E. Griffiths (Boston, 1887).

His elder brother, OLIVER HOWARD PERRY (1785-1819), has even greater renown in American history, yet for a single exploit. Born Aug. 23, 1785, he entered the navy in 1799, and served in the war against Tripoli. Next engaged in the less honorable duty of enforcing the embargo, he had the misfortune to lose his vessel on a reef in Long Island Sound, but was exonerated of blame by a court of inquiry. In 1812 he at first commanded a flotilla of gunboats in New York harbor, then served under Commodore Chauncey on Lake Ontario, and in March, 1813, was sent by him to equip a squadron on Lake Erie. The vessels gathered there being too small, others were hastily constructed at Presque Isle, now Erie, but were closely blockaded by the British fleet under Capt. Barclay. On Aug. 12th Perry contrived to get his vessels out of port, and on Sept. 10th he encountered the British fleet near Put-in Bay. He had in all nine vessels with 54 guns and 492 officers and men. Barclay had six vessels with 63 guns and 502 officers and men. The British guns had longer range and their fire was concentrated on the *Lawrence*, Perry's flag-ship, which had outsailed her consorts. After four-fifths of her crew were disabled and her guns rendered useless, Perry entering an open boat under heavy fire, transferred his flag to the *Niagara*, half a mile off. Then leading his vessels, now favored by the wind, through the enemy's line, he ordered them to deliver a cross-fire which in a few minutes compelled four of the British vessels to strike their flag. The other vessels attempted to escape but were overtaken. Perry immediately wrote to Gen. Harrison the famous despatch: "We have met the enemy and they are ours—two ships, two brigs, one schooner, and one sloop." This brilliant action was the first in which he was engaged. His loss in killed and wounded was 123, that of the British was 400, including Capt. Barclay, wounded. Congress gave Perry a vote of thanks, a gold medal, and the rank of cap-

tain, and bestowed other rewards on his gallant subordinates. The British having now lost control of Lake Erie, evacuated Detroit. Gen. Harrison pursued them and was assisted by Perry at the battle of the Thames a few weeks later. In the next year Perry commanded a body of marines on the Potomac. He afterwards served in the Mediterranean under Decatur. In 1819 he was sent in command of a squadron to the Caribbean Sea. He was seized with yellow fever and died at Port Spain, Trinidad, Aug. 23, 1819. His remains were removed by order of Congress and buried in the cemetery at Newport, where the State of Rhode Island erected an obelisk. In September, 1860, a marble statue by Walcutt was erected to his memory at Cleveland. A bronze statue by W. G. Turner was erected at Newport in 1885. Capt. Perry's *Life* was written by Capt. A. S. Mackenzie (1843).

PERRY, THOMAS SERGEANT, educator and author, was born at Newport, R. I. He is a grandson of Capt. O. H. Perry, and is also descended from Benjamin Franklin. After graduating at Harvard in 1866 he studied at Paris and Berlin, and was made tutor in German at Harvard in 1868. He was editor of the *North American Review* from 1872 to 1874, and afterwards returned to Harvard as instructor in English. He has been busily engaged in lecturing and writing on literary topics. Among his publications are *Life of Francis Lieber* (1882); *English Literature in the XVIIIth Century* (1883); *From Opitz to Lessing* (1885); *History of Greek Literature* (1888). He has contributed to this *Supplement* on "American Literature," "Carlyle," etc.

PERRY, WILLIAM STEVENS, bishop and historian of the American Episcopal Church, was born at Providence, R. I., Jan. 22, 1832. He graduated at Harvard College in 1854, and was ordained priest in 1858. After having charge of churches at Nashua, N. H., Portland, Litchfield, Conn., in 1869 he became rector of Trinity Church, Geneva, N. Y. In 1876 he had been chosen president of Hobart College there, but in September he was made bishop of Iowa. From the commencement of his ministry he had given special attention to the history of the American Church, and was associated with Rev. Dr. F. L. Hawks in historical researches and publications. Together they issued one volume of the *Journals of the General Conventions of the P. E. Church, 1794-1835* (1861), and the *Documentary History of the P. E. Church* (2 vols., 1863-4). In 1868 Dr. Perry was formally appointed historiographer of the church. Of the *Historical Collections of the American Colonial Church* there have appeared volumes relating to Virginia (1871), Pennsylvania (1872), Massachusetts (1873), Maryland (1878), Delaware (1878). Bishop Perry has also published *Handbook of the General Conventions and Journals of the General Convention, 1785 to 1835* (3 vols., 1874); *Historical Sketch of the Protestant Episcopal Church, 1784-1884* (1884); and *The History of the American Episcopal Church, 1587-1883* (2 vols., 1885). Bishop Perry has taken part in the Old Catholic Conference at Bonn, in 1875, and in the Pan-Anglican Councils at Lambeth in 1878 and 1888.

PERSIMMON, the fruit of *Diospyros Virginiana*, or the Date Plum, a member of the order *Ebenaceæ*, of which the hard and dark-colored heart-woods of some species yield the different kinds of ebony. The persimmon is a native of North America, the tree being usually of small size, but occasionally reaching a height of 70 ft. Its wood is very hard and of blackish color, and is of value to replace boxwood in the manufacture of shuttles, and also for last-making and other turnery. The stem exudes a kind of gum. The fruit ripens as high as 41° N. lat. in Illinois. It is of globular form, of the size of a large plum, and in its unripe state is exceedingly astringent, which quality it does not lose until over-ripe. When hard frosts bring it to the verge of decay it becomes soft and very sweet and agreeable in flavor. There are several other

species which bear edible fruit, such as *D. discolor* of the Philippines, which yields a fine fruit, and *D. Kaké* of Japan, whose fruit is of the size of an apricot and is dried as a sweetmeat by the Chinese. (C. M.)

PERSONAL ESTATE. See PROPERTY.

PERU, a city of Indiana, the seat of Miami co., on the N. bank of the Wabash River, 67 miles N. of Indianapolis, on the Wabash, St. Louis, and Western, the Detroit and Fel River, and the Michigan City and Indianapolis Railroads, being the division head-quarters of the two latter. It has a court-house, high-school, and 3 other schools, 4 hotels, 2 national banks, 2 weekly and 2 daily newspapers, 7 churches. Its industrial works comprise woollen, bagging, and 1 planing mill, 3 large foundries, and railroad shops, basket and wood-work factories. It is lighted with gas and has water-works. Settled in 1833, it was incorporated in 1834. Its property is valued at \$5,000,000 and the public debt is \$150,000, the annual expenses being about \$20,000. The population in 1880 was 5280. The surrounding country is agricultural. Petroleum has been found at a depth of 880 ft.

PETER. The various names of this apostle are given in the *ENCYCLOPÆDIA BRITANNICA*, as well as the circumstances connected with his becoming a disciple of our Lord. But the important events in which he evinced his priority among "the twelve" are not so clearly set forth.

There is little or no evidence that the confession at Cæsarea Philippi (Matt. xvi. 13-23; Mark viii. 27-33; Luke ix. 18-22) is identical with the incident narrated in John vi. 66-69. The latter occurred immediately after a discourse in the synagogue at Capernaum, in which Jesus, by rebuking the multitudes for following him because he had fed them, virtually turns the popular feeling against himself. This was shortly after the feeding of the five thousand, the only miracle narrated by all four evangelists. The confession at Cæsarea Philippi was made after the opposition in Galilee had well-nigh closed that region to the ministry of Jesus. The intervening journeys all show increasing antagonism. But thus the disciples were trained to see more clearly the real purpose of their Master's mission. On the borders of the Holy Land, in privacy, Peter, as the spokesman of the twelve, made his confession. It indicates a great advance from the answer given in John vi. 68. The much disputed sentence, "Upon this rock will I build my church," must, therefore, be interpreted in a way that recognizes the priority of Peter. For his name is first in all the lists of the apostles. (The four fishermen are always named first.) Furthermore, the verbal play upon his name seems to compel a reference to the person bearing that name. But priority and primacy are not identical terms, and the personal infallibility of Peter is contradicted by the interview which follows (Matt. xvi. 21-23; Mark viii. 31-33), as well as by the incident at Antioch, when Paul rebuked him (Gal. ii. 11, 12); the very last historical notice of Peter.

The narrative of his attempted walking on the water (Matt. xiv. 28-31), though peculiar to Matthew, is quite significant, since it illustrates alike the strength and weakness of the apostle's character, and represents in act what was expressed in word at Cæsarea Philippi. That his conceptions of the Messianic kingdom were at first purely Jewish is evident, but the Gospels are never read aright until they are regarded as narratives of the training of the disciples to higher conceptions of their Master's Person and work. The Tübingen school ignores this, in order to prove that the twelve were Judaizing to the last, even after the gospel had been widely preached to the Gentiles. But all the evangelists plainly show the preparations for a wider view of the gospel on the part of the twelve. Nor is there any evidence that the Fourth Gospel seeks to present John as more prominent than Peter. Even the threefold denial, narrated with varying details in

all four Gospels, shows Peter in the same character and prominence. The special appearance of the risen Lord to Peter (1 Cor. xv. 5; Luke xxiv. 34) is a recognition of his leadership; all the more significant, because it is stated by the very writers whom the Tübingen school assume to be anti-Jewish in their coloring of the history.

We now pass to the narrative in the Acts of the Apostles. The last half of that book is regarded by some critics as representing Paul in too compromising an attitude to Jewish Christianity; and the same critics object to the earlier half, because it presents Peter as too favorable to the Gentiles. But the narrative is a consistent setting forth of the way in which this man, in spite of his Jewish habits and prejudices, was led to see the universal scope of the gospel. That he proved weak in practising his own avowed principles at Antioch (Gal. ii. 11, 12) only shows that this was the same Peter depicted in the Gospels; advanced in grace and knowledge, but not yet perfect. The persistent attempt "to reconstruct not only church history but also the New Testament," on the theory of a permanent alienation of these two apostles, seems to be disapproved by Dr. Hatch; but he attaches entirely too much weight to the opinions of the critics that uphold this theory. For example: in discussing the question whether Peter ever was at Rome, the *Clementines* are introduced. The historical romance contained in this literature has been used by the Tübingen school as a proof of the sharp antagonism between the Jewish and Gentile elements in the early church. The *Clementines* do exhibit a process of evolution in literature, but they do not prove the main point of the Tübingen theory, nor is it certain that Simon Magus always represents Paul. Yet the *ENCYCLOPÆDIA BRITANNICA* gives as authorities on the *Clementines* only writers of the Tübingen school, and allows a place to the suggestion that the passage in Acts viii. 14-24 is not authentic, but a "reflex of the later legends in which the name of Simon Magus was substituted for that of St. Paul as a representative of false Christianity." Probably no more groundless theory than this has been proposed by skeptical criticism. (An English translation of the *Clementines* with notes by the writer of this article will be found in the *Ante-Nicene Fathers*, Amer. ed., vol. viii., p. 75-346.)

The later history of the Apostle Peter has been confused by the extravagant claim of a twenty-five years' residence at Rome. That he went to Rome toward the close of his life, enduring martyrdom there under Nero, is exceedingly probable; but he could scarcely have been there when Paul wrote his Epistle to the Romans (A. D. 58). Nor is it likely that "Babylon" in his own epistle (1 Pet. v. 13) refers to Rome. It should be noted that many Protestant scholars, including those of very different theological tendencies, hold the opinion that Peter died at Rome. Ecclesiastical tradition is singularly unanimous in supporting the main fact. That Peter and Paul were martyred at the same time is also the traditional belief, but for this there is not the same amount of patristic evidence. It seems quite unlikely that the two apostles ever were in Rome at the same time; certainly Paul makes no allusion to the presence of Peter in any of the epistles written from that city.

The character of Peter is readily understood. "He was the strongest and the weakest of the Twelve. He had all the excellences and all the defects of a sanguine temperament" (Schaff, *History of the Christian Church*, vol. i., p. 253. Compare the same, pp. 253-263, on "the Peter of history and the Peter of fiction"). He has been called the apostle of hope, and his epistles, written when divine grace had matured his piety, are full of consolation. In his speeches, as recorded in the Acts of the Apostles as well as in his epistles, there is a tone of humility in sharp contrast with the claims that have been connected with the primacy assumed to have been transferred from him to

the bishops of Rome. The theory of his advance in knowledge and piety, indicated in the New Testament and accepted in this article, accords with the final word of exhortation from his pen: "But grow in the grace and knowledge of our Lord and Saviour Jesus Christ" (2 Pet. iii. 18, R. Vers.). (M. B. R.)

PETER, EPISTLES OF. 1 **PETER.** The genuineness of this letter has only been assailed by those who have a preconceived theory of the origin of the New Testament writings. The external authority is very strong, reaching back to the sub-apostolic age. The internal evidence is equally so, for the coincidence of thought and expression with other New Testament writings proves nothing against it. (See the various theories noticed in the *ENCYCLOPEDIA BRITANNICA*.) It seems to have been written from Babylon, and to Christians in Asia Minor. Some think "Babylon" is a mystical name for Rome, but as the most probable date is A. D. 63, just before the persecution under Nero, and as it is unlikely that Peter had visited Rome at that date, the term is better understood in its natural sense. The contents accord alike with the gospel as set forth in the other apostolic writings and with the character of the apostle. It should be added that the passages respecting the descent of Christ into Hades (iii. 18, iv. 6) have occasioned much discussion, and that at present the possibility of salvation being offered to those who have died without accepting Christ is based upon these passages by some theologians.

2 **PETER.** This epistle presents peculiar difficulties. Doubts about the genuineness of the Pauline epistles are usually of modern origin, but from early times this epistle has been "disputed" (so Eusebius). Jerome refers to doubts, and Calvin (in his commentary on this epistle) suggests that it was written by one of Peter's disciples, by his command. Even those who believe that Peter wrote it must confess that "it is, perhaps, the least attested writing of the New Testament" (Gloag, *Introduction to Catholic Epistles*, p. 204). Yet, despite the weakness of the early testimony, even in the case of this "least attested writing," the preponderance of probability is in favor of the genuineness of the epistle.

1. *The objections.*—(1) The want of early testimony; (2) the allusion to Paul's epistles (2 Pet. iii. 16), as a whole, implying a late date; (3) the differences in style and diction from the first epistle; (4) the opposition to Gnostic errors of a later date than the apostolic age; (5) especially the striking correspondence between chap. ii. and the Epistle of Jude. In regard to (1) it may be remarked that this is purely negative evidence. After all doubtful allusions are omitted, there yet remains strong positive testimony to its genuineness. The allusion to the epistles of Paul does not furnish a strong argument against this epistle. The reference may be to a few of the former, not to a complete collection. Paul had certainly, before the earliest date to which this epistle is assigned, written several letters to Asia Minor, the region to which this letter was addressed. The differences of style between this and the first epistle do not seem to be greater than those existing in the case of the acknowledged Pauline epistles. All arguments from such premises are notoriously precarious, especially when the document in question is so brief. The errors combated are not necessarily those of a later age than that of the apostles. The correspondences with the Epistle of Jude present the most serious difficulty. The current of opinion now sets in favor of the view that the Epistle of Jude was earlier, and that this letter is dependent on that. But many holding this view still accept Second Peter as genuine.

2. *Evidence of Genuineness.*—(1) The similarity of style and sentiment to the First Epistle, notwithstanding the acknowledged differences. (2) The similarity to the speeches of Peter recorded in the Acts of the

Apostles. (3) The high character of the letter itself. (4) The superiority to the writings of a later age. On this rock most of the destructive criticism destroys itself. (5) The fact that it claims to be written by Peter, and the moral impossibility of such a document being the work of a wilful forger; this argument derives additional strength from the reference to the transfiguration (chap. i. 17, 18), and the words "we did not follow cunningly devised fables" (chap. i. 16). Despite the lack of early testimony and its omission from the Syriac version, (6) There is a general recognition of its genuineness and canonicity in those ages when such questions became prominent. (7) Were it the product of a later age there would be more positive evidence of coloring from that age; for example, the particular form of heresy against which it was aimed would be readily recognized in some error prevalent in the second century. But no such identification is possible. (8) No motive for forging such a letter can be discovered. (9) While the "subjective test" in itself proves nothing, yet in view of all the above considerations the practical value of the epistle to Christian people for so many generations has much weight in determining whether it should be classed with the other New Testament books. It ought not to be classed with them, if its claims respecting itself are false.

3. The epistle seems to have been addressed to the same circle of readers in Asia Minor as the First Epistle (2 Pet. iii. 1), and to this view no objection can be raised, if the genuineness be accepted. The errors it combats were those that might be naturally developed in the region and among the people for whom the First Epistle was designed. Persecution is implied in one letter, heresy in the other; but this does not involve a different circle of readers, nor does it make against the genuineness of the later epistle.

4. The *design* of the epistle is twofold: (1) to warn against error and the teachers of it; (2) to exhort the readers to advance in holiness. This appears in the closing paragraph (chap. iii. 17, 18), as well as in the structure of the epistle. While we cannot definitely identify the false teachers referred to, it is still more difficult to identify them as the errorists of a later age. A number of the New Testament epistles indicate incipient heresies, and the growth of error has always been rapid. It should be noticed that the correspondence with the Epistle of Jude is in the description of the false teachers (2 Pet. ii.).

It enunciates no specifically new teaching, breathes the spirit of the apostle whose name it bears, and furnishes a fitting valedictory of the venerable man who was awaiting the martyrdom predicted by his Master (John xxi. 18, 19). (M. B. R.)

PETERMANN, AUGUST (1822–1878), a German geographer, was born at Bleicherode, April 18, 1822. He was educated at Nordhausen and in 1839 entered the geographical institute at Potsdam, where he assisted in preparing Bergham's *Physical Atlas* and also prepared the maps of A. Von Humboldt's *Asie Centrale*. In 1845 he went to Edinburgh to superintend A. Keith Johnson's edition of the *Physical Atlas*. In 1847 he established himself in London, and contributed geographical articles to various publications. In 1854 he returned to Germany and took charge of Justus Perthes' geographical institute at Gotha. Here he founded his monthly *Mittheilungen*, which still remains the highest authority in current geographical literature. His activity was not confined to gathering, condensing, and criticising the researches of travellers. He directed and promoted the exploration of the less known parts of the earth, especially Africa and the Polar regions. His maps are of the highest excellence. In 1876 he visited the United States. He died by his own hand at Gotha, Sept. 25, 1878.

PETERS, CHRISTIAN AUGUST FRIEDRICH (1806–1880), a German astronomer, was born at Hamburg,

Sept. 7, 1806. In 1826 he was employed at the Altona Observatory, and in 1833 was made assistant at the Hamburg Observatory. In 1839 he took a similar position at Pulkowa near St. Petersburg. His valuable researches in regard to the motion of the fixed stars obtained for him admission to the St. Petersburg Academy. These investigations he continued to the end of his life. In 1849 he was made professor at Königsberg and in 1854 director of the Altona Observatory. Here also he became editor of the *Astronomische Nachrichten*, of which 58 volumes appeared under his direction. In 1872 the observatory was removed to Kiel, where Peters was made also professor in the university. Here he died May 8, 1880.

PETERS, CHRISTIAN HENRY FREDERICK, astronomer, was born at Coldenbüttel, Schleswig, Sept. 9, 1813. After graduating at the University of Berlin he was employed in astronomical work at Copenhagen and Göttingen. In 1838 he set out on scientific explorations which extended from Sicily to Palestine. In 1843 he was made astronomer at Naples, but having taken part in the revolutionary movement of 1848 he afterwards went to Constantinople. After the Crimean war he removed to the United States and was for a time connected with the Coast Survey. In 1858 he was made professor of mathematics and astronomy at Hamilton College, at Clinton, N. Y., where he took charge of the observatory, now called Litchfield Observatory. Some of his labors here have been noted under HAMILTON COLLEGE, to whose reputation he has greatly contributed. He also was prominent in the observation of the total solar eclipse of Aug. 7, 1869, at Des Moines, and had charge of the expedition sent to New Zealand by the U. S. government to observe the transit of Venus, Dec. 9, 1874. Owing to his skillful management his party was the only one which had entire success, having secured 237 photographs of the transit. He is widely known as a discoverer of asteroids.

His brother, WILHELM KARL HARTWIG PETERS (1815-1883), noted as a traveller and zoologist, was born at Coldenbüttel, April 22, 1815. After studying medicine at Copenhagen and Berlin, he first investigated the fauna of the Mediterranean, and was appointed assistant to the Anatomical Institute at Berlin. In 1842 he went to Lisbon, and then undertook a scientific exploration of the Portuguese possessions in Africa. Returning to Berlin in 1848 he was made professor, afterwards professor extraordinary and in 1857 professor of zoology and director of the zoological collections. Under his care these were raised to the first rank. His chief work is *Naturwissenschaftliche Reise nach Mozambique* (5 vols., 1852-68). His contributions to comparative anatomy, philology, and the natural sciences were valuable. He died at Berlin, April 20, 1883.

PETERS, RICHARD (1744-1828), jurist, was born near Philadelphia, June 22, 1744. His father, William Peters, held several judicial offices. The son graduated at what is now the University of Pennsylvania in 1761, and was admitted to the bar in 1763. He commanded a company of provincial troops in 1775, and was made secretary of the Congressional Board of War in 1776. He detected and exposed Benedict Arnold's embezzlement of funds while in command at Philadelphia. In 1781 Peters resigned from the Board of War and was soon elected to Congress. He was afterwards speaker of the Pennsylvania Assembly and of the State Senate. In 1785 he visited England and assisted in securing the act of succession for the bishops of the Protestant Episcopal Church in America. In 1792 he was made judge of the U. S. District Court of Pennsylvania and held this office till his death, Aug. 22, 1828. He was noted as a wit and was a practical farmer. His country-seat at Belmont is now included in Fairmount Park, Philadelphia.

His son, RICHARD PETERS (1780-1848), was reporter of the U. S. Supreme Court for many years and pub-

lished 18 volumes of *Reports*, besides condensations and digests.

PETERS, SAMUEL ANDREW (1735-1826), commonly known as "Parson Peters," was born at Hebron, Conn., Dec. 12, 1735. He was a grandnephew of Hugh Peters, Cromwell's chaplain, for whom see the *ENCYCLOPÆDIA BRITANNICA*. He graduated at Yale College in 1757, went to Europe and took orders in the Church of England in 1760. Returning to Connecticut he had charge of churches at Hartford and Hebron. During the agitation which preceded the revolution Peters offended his neighbors by the political letters he sent to England and New York. In 1774 he was rudely driven out and went to Boston and thence to England. His satirical *General History of Connecticut* (London, 1781) provoked loud remonstrance in that State. It has been republished several times and even defended as a sober history (see McCormick's edition, N. Y., 1877), though it seems more like the after-dinner talk of a spiteful humorist. It is the chief authority for the current fiction about the Connecticut Blue Laws. (See BLUE LAWS.) In 1794 Peters was chosen bishop of Vermont, accepted the office and wrote an episcopal letter to the churches, but was refused consecration by the Archbishop of Canterbury. He returned to America in 1805 and published a *History of the Rev. Hugh Peters* (1807), in which vanity, family pride, and his customary recklessness in regard to facts are strangely blended. At the age of eighty he made a journey to Minnesota to prosecute some land claims. He died in New York city, April 19, 1826.

PETERSBURG, a city of Virginia, in Dinwiddie county, is on the S. bank of the Appomattox River, 23 miles S. of Richmond. The falls of the river near by mark the head of tidewater and navigation, though flatboats are used above. Large vessels receive cargoes of tobacco at City Point at the mouth of the Appomattox, 12 miles below. Two railroads connect the city with Richmond, Norfolk, and other places. Petersburg has a court-house, government building (including custom-house and post-office), 6 banks besides savings banks, a daily and 3 weekly newspapers, 25 churches, several schools, both public and private, a theatre, and 2 public libraries. Its industrial works comprise foundries, cotton- and flour-mills, and tobacco-factories. The city is well built and has good natural drainage. It is lighted with gas and has water-works and a fine park. The town was laid out in 1733 by Col. William Byrd and was incorporated in 1748. During the revolutionary war it was twice occupied by British troops. During the second war with Great Britain it obtained the name "Cockade City," from the ardor of its volunteers. In the war of secession it attained still greater prominence, as it was the last stronghold of the Southern Confederacy. After the various attempts to reach Richmond from the north and east had failed, Gen. Grant, just after the battle of Cold Harbor (*q. v.*), determined to seize Petersburg. On June 12, 1864, the army of the Potomac crossed the James River below City Point, but the attack on the works was delayed until the 15th. Gen. W. F. Smith then succeeded in capturing some redans, and on the next day Generals Hancock and Meade captured more. But Gen. Beauregard, in command of the Confederates, maintained his hold of the city and strengthened its inner line of defences. The army of the Potomac now invested the city and the Weldon Railroad was torn up by cavalry. On June 25th Gen. Burnside, at the suggestion of Col. Pleasants, whose regiment was composed of Pennsylvania miners, authorized the construction of a mine under the enemy's works. The mine was ready July 23d, but the explosion was delayed until 5 A. M. on July 30, when it made a crater 100 ft. long and 20 ft. deep. The Union batteries began a vigorous cannonade and a division promptly entered the crater, but its cowardly commander left the troops to themselves, and most of their

were captured. The siege was prolonged until Grant resumed active operations against Lee's army in the following March. After Sheridan's victory at Five Forks, Lee saw that he must evacuate Petersburg, and Gen. Grant entered it on April 3d. The surrender at Appomattox followed on April 9th. Several years were required to restore Petersburg to its former prosperity, but its trade eventually increased beyond its former limits. Its population in 1880 was 21,656.

PETIGRU, JAMES LOUIS (1789-1863), the leading opponent of nullification in South Carolina, was born in Abbeville co., S. C., May 10, 1789. Graduating at Columbia College in 1809, he was admitted to the bar and became a prominent lawyer at Charleston. He adhered to the Federal party, and when the opposite views swept over the State and were pushed to their extreme in nullification and secession he remained faithful. His energy and eloquence did not avail to stem the tide, but he was called by the Legislature to codify the laws of the State. After the secession of the State he was engaged in this work, and completed it shortly before his death at Charleston, March 9, 1863.

PETITION, RIGHT OF. The right of petitioning the government, as existing in American political institutions, was derived from the system of England, where it had become established as an incident of the advance towards popular government, and passed into our colonial system, and thence into the Constitution of the United States and those of the States of the Union with little change. In the original frame of the Constitution of the United States no mention was made of the right of petition, but the First Amendment provides that Congress shall make no law abridging the right of the people peaceably to assemble, and to petition the government for a redress of grievances. Four States have substantially followed the form adopted in the Constitution of the United States as above given. In seven States the expression *redress of grievances* is omitted and the right is stated as that to petition, by address or remonstrance, the government or any department thereof. In one State it is to petition government on all matters, and in another to petition on any subject. In six States the object of petition is stated as the redress of grievances or other purposes. In sixteen States it is as follows: "to consult for the common good, to instruct representatives, and to petition the Legislature for redress of grievances."

The right of petition has commonly been associated with that of assembling for consultation as to matters of public interest, but never has been regarded as limited to the case of the transmission to the government of the results of popular deliberation in public assemblies, but on the contrary has been treated as an individual right as well as one appertaining to collective bodies of citizens. It will be observed that in the largest number of States the provision as to the redress of grievances is associated with one that secures to the citizen the right to instruct his representatives, and that in several of the States there is no definition of the subjects to which such petitions should relate, but the right is indefinitely extended by such expressions as, "other purposes," or "upon all matters," or "any subject."

While the right to make known one's grievances to the judicial branch of the government and to its executive officers is undoubtedly embraced in these constitutional provisions, the main object they had in view was to regulate the intercourse of the people with their representatives in the legislative body, for while the Legislature would, presumably, provide for the redress of the citizen, as it regarded the other branches of the government, the intercourse with that body was required to be placed under the protection of the constitution to which it was subject. At the present day the right of petition is understood as a right of the

citizen to make known to the legislative body his wants as an individual or as a member of the community.

Notwithstanding the fact that in representative popular governments the legislative body is habitually composed of the representatives of distinct geographical districts, that would suggest that the communication between the citizen and the Legislature should take place through the representative of the particular district of which such citizen is an inhabitant, still the right to communicate directly with the legislative body is habitually recognized, which is consistent with the idea that the Legislature acts as a unit, whatever may be the constitution of its parts.

In the United States the right of petition to legislative bodies has become so completely interwoven with the habits and ideas of the people that it has seldom been made the subject of discussion and criticism. Yet an instance has occurred in the history of the country where the right was involved in heated controversy. The right of petition to Congress was brought into question as involved with the anti-slavery agitation in the United States. It was conceded that Congress had no direct authority to control the condition of slavery within the States that composed the Union. Within the District of Columbia, the seat of government of the United States, embracing a very limited territory derived by cession from the States of Maryland and Virginia, slavery existed at the time of the cession and continued to exist as a legal institution until finally abolished as a consequence of the war of the rebellion. It was not seriously denied that Congress had authority to control the institution within that District, but the position was taken that it would be a breach of public faith to abolish slavery within that District while the States of Maryland and Virginia, from whom it was derived, still continued to maintain the institution. The question of the right of Congress to interfere to prohibit or limit the slave-trade between the States, and the introduction of slaves within the Territories of the United States for the purpose of holding them in slavery in such Territories, was debated from the standpoint of opposite views as to the construction of the Constitution of the United States. The controversy as to the proper construction of the Constitution turned upon the question whether the government of the United States was to be regarded as a sovereign national government, limited as to the subjects over which that sovereignty might be exercised, or whether it represented an aggregate of delegated powers that could not be enlarged beyond the particular subjects to which it was limited. The Supreme Court of the United States had adhered to the construction of these powers that rested upon the conception of a national sovereignty, but the adherents of slavery, the dominant party in Congress, still held doctrines that excluded Congress from all action relating to slavery, affecting its existence within the States, the Territories, or the District of Columbia.

The policy of the opponents of slavery centred upon the limitation and final abolition of slavery within the District of Columbia as a step preliminary to its ultimate extinguishment throughout the United States. With this end in view petitions were presented to Congress seeking the exercise of its powers to this end. These petitions asked that the slave-trade existing in the District should be abolished, that slavery in the District might be abolished, and for the adoption of a variety of public measures all tending to the ultimate extinguishment of slavery.

At first these petitions were respectfully received by Congress, but immediately laid upon the table without reference or consideration. In 1836 this considerate method of dealing with petitions of this class was deemed unsatisfactory by the friends of slavery and a more emphatic expression of disapprobation on the part of Congress of this line of agitation demanded. Mr. Calhoun, in the Senate, moved the rejection of a petition for the suppression of the slave-trade and the

emancipation of the slaves within the District upon the ground that Congress had no jurisdiction over the subject, but this motion was not carried. Respect for governmental forms, inseparable from free institutions, still continued to moderate the counsels of the majority of Congress, although in entire sympathy with the objects pursued by the friends of slavery.

The next step taken to defeat the objects of the petitioners was a resolution of the House of Representatives that all petitions relating to slavery in the District of Columbia should be referred to a select committee who should be instructed to report that Congress had no constitutional authority to interfere in any way with the institution of slavery in any of the States, and that it ought not so to interfere in the District, because it would be a violation of the public faith, unwise, impolitic, and dangerous to the Union, and whose duty it should be to furnish the reasons for such conclusions. The select committee was appointed and reported that all petitions, memorials, propositions, or papers relating in any way to the subject of slavery, or the abolition of slavery, should, without either being printed or referred, be laid upon the table. This report and resolution were adopted by an overwhelming vote. The following year, 1837, this resolution was in substance re-enacted by the House of Representatives. The next Congress affirmed and strengthened the position thus assumed, the House of Representatives resolving that all petitions, memorials, and papers touching the abolition of slavery, or the buying, selling, or transferring of slaves in any State, District, or Territory of the United States should be laid upon the table without being debated, printed, read, or referred, and that no further action whatever should be had thereon.

This action of the House of Representatives was regarded as needing explanation, and accordingly at a later period an explanatory resolution was adopted by the House of Representatives. The necessity for some explanation of the position assumed by the House was obvious. The people of the United States had been accustomed to regard the right of petition as an incident of representative popular government that was essential to its maintenance, and any aggression upon that right, when brought fully to the popular understanding, would tend to the injury of the cause in the interest of which it was undertaken. The slave policy could only be maintained by co-operation on the part of representatives whose constituencies had no direct interest in the institution of slavery, and, in the event that the choice had to be made between that institution and the dismemberment or crippling of the national government, would adhere to the Union although the destruction of slavery might be the consequence. Such considerations imposed upon the majority in Congress the necessity of placing their action in the most favorable light.

The explanatory resolutions denied the jurisdiction of Congress over the institution in the States and affirmed that the petitions introduced for the abolition of slavery in the District and against the removal of slaves from one State to another were part of a plan set on foot to affect the institution of slavery in the several States, and thus indirectly to destroy the institution within those States; that Congress cannot rightfully do that indirectly which it cannot do directly; that the agitation of the subject of slavery in the District or the Territories, with a view of disturbing or overthrowing that institution in the several States, was against the spirit and meaning of the Constitution and a breach of public faith; that the Constitution rests on the principle of equality among the States, and Congress had no right to discriminate for or against their respective institutions with the view of abolishing the one or promoting the other. These recitals were followed by a resolution declaring that all attempts on the part of Congress to abolish slavery in the District of Columbia or the Territories, or to discriminate be-

tween the institutions of the several States in the manner indicated in the foregoing recitals, are in violation of the Constitution, destructive of the fundamental principle on which the Union rests, and beyond the jurisdiction of Congress. It finally declares that any petition, memorial, proposition, or paper touching or relating in any way, to any extent whatever, to slavery or the abolition thereof, should on the presentation thereof, without any further action thereon, be laid upon the table without being debated, printed, or referred. The subsequent action upon petitions of this class went a step further, declaring that such petitions should not be received or entertained in any way whatever.

It is noticeable that the action of Congress that has been referred to proceeded step by step to unsettle and deny the right of petition to the national legislature as it regarded the subject of slavery in the United States, and exhibits a hesitation in taking the extreme ground that was ultimately reached upon that subject. At first it seemed sufficient to lay all petitions on that subject upon the table, thus recognizing the right of their presentation and the duty of their reception, but giving expression to the disapprobation of Congress of the measures propounded by such petitions. The next step was that they should not be printed or referred, but at once be laid upon the table, still leaving the duty of receiving them admitted, but providing that they should neither be brought into consideration nor disseminated by printing. A further step was that they should not be read, thus closing the ears of Congress, as a legislative body, to matters deemed of great public importance by large bodies of the people whom that body had assumed to represent. It only remained to declare that such petitions should not be received to complete the denial of a fundamental tenet of liberty, and that step was at last taken.

The history of the events thus briefly stated is of interest not only in characterizing the nature and tendencies of the institution of slavery in its effect upon the principles of liberal government, but as exposing dangers that may at any time threaten the right of petition when material interests are sufficiently strong and opposed to the principles of social order. That right is in effect the right of communication between the sovereign people of a representative popular government and the persons selected by them to embody their convictions and desires in public laws, and cannot be denied without subverting the proper relations between the public authority and the agents for its exercise. Assume a state of things in which the majority of the people of a popular government concur in a certain line of policy, or of opinion as to the effect of certain laws, and the immediate representatives of that majority refuse to give attention to the representations of the minority, and a case is presented that contradicts the principles upon which not only popular representation in government depends but the very security of popular liberty. Should the representatives of the people misapprehend or intentionally disregard the sentiments or interests of the majority of the people they represent, to affirm that such majority may be excluded from presenting such sentiments and interests directly and formally to the body assuming to represent it, is to contradict the plainest dictates of common sense. It is equally unreasonable that a minority of the people should be excluded from formal communication to the representative body, for rational government implies a comparison of opposite and divergent opinions, and to shut out any respectable body of opinion is to destroy the balance of the system. It may be said that the right of petition has lost much of its importance since the policy of frequent elections of representatives has been adopted, and that the elective act covers all that was intended to be secured under the right of petition. Such a suggestion is in harmony with the existing tendency to replace rational methods by technical devices, and is not strengthened by what

appears in the development of the elective system in this country and elsewhere. The election is means of selecting an agent, while the right of communicating with the legislative body is means of directing that agent in the discharge of his duty. To affirm that the right to select an agent tends to displace the right to direct him when selected, is neither consonant with logic or common sense. The tendency of the elective system in highly composite communities and governments appears to be in the direction of integrating the material interests of the community in the formation of a public policy with especial reference to some exigency in public affairs that for the time being displaces other interests however important. Public agents selected with reference to a particular exigency, and as the exponents of a particular policy, especially when that policy is based on material interests, are likely to need all available modes of communication with their constituencies in order to know the state of opinion and feeling on other than material interests.

The press has important functions in keeping in mind the aspirations and wishes of the people, but represents public opinion in an indirect and reflex way only, while the petition, memorial, and remonstrance to the legislative body may be made, and commonly are made, the vehicle of collective opinion and sentiment. If the morals and humanity of a community ought to have any place in an organized system of legislation, that place must be assigned in the means of communication between the legislative body and collective bodies of citizens. The right of petition thus stands as the exponent of the conscience and aspirations of the community as well as of its neglected interests, material and social.

Assuming then that there is reason for maintaining the right of petition, as essential to sustaining the proper relations between the agents of government and the governed, and the effect upon that right of the action induced by the slavery agitation is of practical importance. It is evident that right was denied, at first in substance and afterwards in form, to those who sought to express their convictions as to the social character of slavery to Congress. That denial took place on two grounds: first, that Congress was asked to do that which it had no authority to do; and, second, that what was sought would occasion a breach of the public faith pledged to the States of the Union that sustained the institution of slavery. That Congress had authority to act on the representations made to it of the social evils arising from slavery, even in the States, cannot be denied with any reason. If it appeared to Congress that the institution of slavery as it existed in the States was detrimental to the interests of the whole Union, it had authority under the Constitution to frame articles of amendment to the Constitution to be submitted to the States for ratification, which if receiving the assent of three-fourths of the States would become part of the Constitution and would be competent to inhibit slavery within the States. Whether the case presented by the petitions on the subject of slavery was such as to call for the exercise of that power was a question for consideration by Congress, and if it had the right to consider that subject it was its duty to receive petitions in relation to it.

Placing the impropriety of the consideration of what was asked by the petitions upon the ground that it would be a breach of public faith to the slave States was virtually admitting that Congress possessed the power of prohibiting slavery in the District of Columbia and the Territories. The affirmation here implied is that wherever there is a governmental policy that, in the opinion of a portion of the people and of the States, is necessary to be maintained on the ground of public faith, the residue of the people and States shall not be permitted to oppose that conclusion by means of the right of petition. Bald as such a ground would be it is stronger than the case actually stated. It was

not claimed that attention to the representations of the opponents of slavery would directly operate as a breach of the public faith, but that it would indirectly have that effect. The ground taken was that the agitation of the question of the abolition of slavery endangered the institution, although in what form that danger was to be realized was not stated among the reasons given for the action of Congress. The exclusion of the petitions was based upon a purpose to suppress the agitation of the slave question, which means the suppression of the right of public discussion of the bearing of public measures. It was not claimed at that day that the methods of agitation implied anything beyond popular discussion, and, therefore, agitation meant discussion and nothing more. The question is resolved to the simple inquiry whether the right of petition may with propriety be denied as a means of suppressing discussions on public questions where such discussion may possibly, in some indirect way, entail changes on the condition of some section of the country by which it is regarded as undesirable, and in this form of statement needs no elucidation. It is a noticeable fact that the States that took part, through their representatives, in this effort to suppress the freedom of discussion of public affairs are the same States that vehemently opposed the Alien and Sedition laws upon the ground that they sought to suppress the freedom of speech and of the press.

The action of the House of Representatives in thus refusing to receive petitions coming from the people of the United States must be weighed by the provisions of the first article of amendment of the Constitution of the United States, which declares the right of the people peaceably to assemble and petition the government for a redress of grievances. The term "grievances," as here used, was borrowed from the history of early times when the people having no hand in making the laws, if aggrieved by laws unsuited to their condition and wants, assumed the attitude of supplicants to the law-making authority for that which they deemed to be for their good, and the subjects of their requests were termed grievances where they complained of bad laws or asked the enactment of good ones. With the progress of liberal ideas this privilege of communicating with the law-making power came to be recognized as a right that might be claimed under the principles determining the nature and sanctions of government as adjusted to the needs of social man. Still further progress in the right understanding of governmental principles found the right derived from the fact that the people were the source of all public authority, which could not exist without their authorization or permission, and therefore were entitled to make known their desires to those who were intrusted with the formation of laws.

The Bill of Rights, which is a fixed feature of all the American constitutions and was derived from the institutions and ideas of England, as the product of popular revolution in that country, perpetuates the right of petition as a fundamental right incident to the relations between the agents of government and the people. By comparing together the various forms in which this right is recognized in the constitutions of the various States and comparing them with the Constitution of the United States, it is made clear that the term grievances is used in no narrow or technical sense but as comprehending all that may be within the authority of the law-making power to promote the well-being of the citizen.

It has never been supposed that a legislative body deriving its powers from a written constitution embodying the Bill of Rights, as the expression of the principles of liberty that should be the foundation of all governmental authority exercisable, could decline to exercise the powers enjoined by it or do that which it prohibits for any prudential reason whatever without an infraction of the obligations imposed by it. Where one clause of the bill secures the right of popular dis-

cussion and another that of petition to the legislative body the boldest conceivable infraction of its requirements would be where the right of petition was denied for the purpose of stifling public discussion. The right of petition as stated from its historic and constitutional sources implies that appeal to the reason of man can never be detrimental to the true interests of government or society, although appeals to popular passion, that are less apt to attract attention and receive restraint, may entail the greatest evils upon governments and communities.

See Greeley's *American Conflict*; J. Q. Adams's Speeches in *Congressional Globe* (1837-42), and SLAVERY in this work.

(A. J. W.)

PETOFI, SANDOR or ALEXANDER (1822-1849), a Hungarian poet, was born at Kis-körös, Dec. 31, 1822. He was sent to various schools, but his restless disposition led him to become a soldier and then a strolling player. In 1843 his poems in the newspapers attracted notice, and soon a collection of them appeared. They depicted the light and shade of peasant life, and he has been well called the Robert Burns of Hungary. Among his noted productions are *The Hammer of the Village* (1844); the epic *Hero Janos* (1845); the drama, *Tiger and Hyena* (1846), and several novels. In 1848 he led the young men of Pesth in the movement for Hungarian independence, to which his national songs powerfully contributed. He was afterwards adjutant to Gen. Bem, and in the battle of Segesvar, July 31, 1849, he was seen for the last time. In 1882 a statue of him by Huszar was erected in Budapest. His poems were translated into English by Sir J. Bowring (1866), and there have been many German translations.

PETROLEUM. This industry, during the years 1883 to 1888, has undergone numerous and important changes. It was during this period that the vast accumulations reached their highest, the stocks in the tanks and pipe-lines during the year 1884 reaching a total of 40,000,000 barrels. The total production of crude petroleum during the same year was about 25,000,000 barrels, nearly 2,000,000 barrels of which were added to the already burdensome supply above ground. Drilling operations continued unchecked and it became a serious question what disposition could be made of the oil. During the summer of 1887 the producers organized under the name of the Producers' Protective Association, for the purpose of restricting the production of oil and to restrict the drilling of new wells. As the average cost of oil to the producer is \$1.17 per barrel, such a course was considered absolutely necessary to prevent a continuance of serious losses. The plan adopted contemplated the reduction of production fully 17,000 barrels per day, and it was believed that this course would in a short time bring about such a change in the statistical situation that the market price of crude oil would advance and in future insure a profit to the producer. The term of this agreement was one year from November 1, 1887. Under this agreement the production was restricted and drilling operations were suspended. Stocks were reduced an average of fully 600,000 barrels per month, but the price of the product did not show the improvement that was hoped for, owing to speculative operations on the several exchanges. There was, nevertheless, an improvement in the price, and the full effects of the movement were beginning to be manifest as the term of what became popularly known as "the shut-down agreement" neared its close.

The most prolific oil-field yet developed is what is known as the Bradford field, which lies in the upper part of McKean co., Pa., and occupies a small portion of Cattaraugus co., N. Y. This field has produced a total of 150,000,000 barrels of crude petroleum during the past twenty years. The greatest production was in the year 1881, when the enormous total

of 23,000,000 barrels was reached. During the month of August of that year the average daily production exceeded 80,000 barrels, but in December the production had declined to an average of 70,000 barrels per day. The number of wells drilled in this field during the year 1882 reached 3,803, and the total number since oil was first discovered in that prolific territory is fully 16,000, about 10 per cent. of which were unproductive. The rise and decline in the production of this field is a fair illustration of the whole producing area of the States of Pennsylvania and New York, although some of the fields show a more steady production. The production of the Bradford field in 1887 had declined to 7,700,000 barrels. The maximum daily production of the Allegheny field was 24,000 barrels in July, 1882; that of the Washington field was 18,000 barrels in September, 1886; of Cherry Grove, 40,000 barrels in August, 1882; of Thorn Creek, 15,600 barrels in November, 1884. These fields have played an important part in the history of petroleum, although others of smaller production exerted an influence on the speculative market altogether out of proportion to their importance. Venango county, where oil was first pumped by Col. E. L. Drake in 1859, has produced about 60,000,000 barrels. Butler and Clarion counties have together produced about 70,000,000 barrels. These comprise the principal fields from which comes the oil that produces the burning oil, or kerosene, of commerce.

The oil district known as the Franklin field produces an oil distinct in character and one which is not taken into account in the statistics of production of the Pennsylvania fields. It is a heavy oil of low cold test which is used for the manufacture of superior grades of lubricating oil. Its average price is about \$4 per barrel at the wells. The wells in this field produce less than 10,000 barrels per month, the average per well not exceeding one-half barrel per day. The wells in West Virginia also produce an oil of a heavy gravity used exclusively in the manufacture of superior grades of lubricating oils. The product of these fields is not counted in the tables giving the statistics of production, consumption, stocks, etc. Important discoveries of petroleum have also been made in Wyoming Territory and in several of the Southern States, and it is believed that petroleum may be found in nearly every State. The wells in California produce oil of a quality similar to the Bradford oil and in quantity sufficient to supply the requirements of the entire Pacific coast of the United States.

The oil-fields of Ohio have been developed since 1885 and pipe-lines have been laid and immense storage tanks erected. The oil is inferior to that from the wells in Pennsylvania, but the wells are more prolific and the producers continue to drill wells though the price realized for the product is only 15 cents per barrel. The principal fields in this State are in the vicinity of the city of Lima, and in North Baltimore, Wood county. The Ohio oil, owing to its low cost, is used as fuel to generate steam in the burning of brick and in some metallurgical operations. It has been found more economical than coal and its use as fuel is extending. A pipe-line has been constructed from the Lima field to the city of Chicago, which has a capacity for supplying that city with 9000 barrels daily of the liquid fuel. The transport of petroleum was formerly confined to railway vessels, but the fear from explosion has been found to be groundless and steamships are now regularly engaged in carrying both crude and refined petroleum. Steamships and sailing vessels have been constructed to carry petroleum in bulk. In their hulls are fitted iron tanks which occupy the entire space between decks, into which the oil is pumped direct from the reservoirs at the refineries. Arriving at its destination, the ship is unloaded by powerful steam-pumps in one-fifth of the time required to unload a vessel of similar size loaded with the oil in barrels.

Market Value.—The price of crude petroleum has varied greatly. The highest price realized was \$20 per barrel during the first five months following the date of drilling the first well by Col. Drake in 1859. The production, however, soon exceeded the demand, and there being at that time but imperfect facilities for storage, the price declined rapidly and reached the lowest point in November, 1861, when oil was sold at the wells at 5 cents per barrel. As improved methods for refining the oil were invented the demand increased and the price advanced, reaching \$14 per barrel in July, 1864. This was in the early history of the industry. During the last eight years, while the fluctuations have at times been sudden, the range of prices has been within narrower limits and values have been for the most part governed by the usual trade conditions. Speculation on the petroleum exchanges has at times governed prices and caused depression in values despite decreasing stocks, increasing consumption, and restricted production. Thus, during the first half of the year 1888 the price of crude petroleum has averaged lower than during the year when the stocks were largest and the production much larger. Table I. gives the highest and lowest prices per barrel of 42 gallons in each year, and the month when such prices obtained :

TABLE I.—Highest and Lowest Price.

Wells Drilling.—Owing to various causes the number of wells in process of drilling has varied greatly from year to year and from month to month. The

discovery of a new field or pool has always stimulated new drilling ventures, while declining production and continued failures have at other times tended to re-

strict operations in untried fields. The largest number of new wells drilling was 618, in November, 1876, and the smallest number was 33, in March, 1888. The large decrease in new work during 1887 was due to the low price of the product, and during 1888 to an agreement between the producers to restrict operations, with the object of reducing the stocks. The number of wells being drilled at the end of each month in the years 1876 to 1888 is given in Table III.

Wells Drilled.—The largest number of wells completed in any month was 470, in May, 1878, and the

smallest number 49, in April, 1888. The largest number completed in any year was 4217, in 1880, and the smallest number since 1875 was 1644, in 1887. The year 1888 will show a further decrease, owing to the suspension of drilling operations pursuant to an agreement among the producers entered into in the summer of 1887, and which was to continue from Nov. 1, 1887, to Oct. 31, 1888.

The number of wells completed in each month during the years 1870 to 1888, and the total for each year, are given in Table IV. :

Producing Wells.—The number of producing wells shows an almost unbroken increase from year to year to 1886 when the number reached 24,726. During 1883 there was a decrease of 1109 from the total of the previous year, but the year following showed a large increase. The largest number of producing wells at any time was 25,593, in February, 1887. Since Octo-

ber, 1887, the decrease has been fully 8000, showing the effect of the suspension of drilling operations, and the fact that a large proportion of the wells soon cease to be productive. Table V. gives the number of producing wells at the close of each month in the years 1876 to 1888, with the yearly average :

TABLE V.—*Producing Wells.*

Production.—The production of petroleum in the Pennsylvania and New York oil-fields has varied considerably from month to month, but there was a gradual increase from 1861, when the industry began to assume important proportions, until 1876. During the following year the industry made great strides, and each succeeding year showed a large increase in the production until 1882, in which year the maximum was reached, since which time there has been a decline. The yearly gross production in barrels and daily average from 1859 to 1875 inclusive are given in Table VI. :

TABLE VI.—*Yearly Production and Daily Average.*

Year.	Total bbls.	Daily av'ge.	Year.	Total bbls.	Daily av'ge.

1867.....	3,347,306	9,143			

Beginning with the year 1876 the yearly increase was unbroken until 1883, since which there has been considerable variation in the production, due to various causes, mainly, however, to the decline in the productiveness of many of the wells and the exhaustion of pools, as small fields are termed. The discovery of flowing wells in new territory has proven a greater incentive to the producers than has an advance in the market price of the product. Such a discovery has always stimulated drilling operations, resulting in a large increase in the number of new wells. If the new wells prove productive, it indicates the discovery of a new pool or field, according to the extent of the productive area. The determination of the extent of a new field sometimes results disastrously to the drillers as territory, but a few rods from a good well may, and often does, prove unproductive. The remarkable decrease shown in the returns for 1888 is due to the restrictions agreed upon by the producers, as already mentioned. Table VII. gives the average daily production, in barrels of 42 gals., during each month in the years 1876 to 1888 inclusive :

TABLE VII.—Average Daily Production.

Consumption.—The consumption of petroleum has increased steadily, and, while it did not keep pace with the enormous increase in the production from 1876 to 1882, there has been no check to the increase since then, while the declining production has caused a corresponding decrease in the stocks held in tanks and pipe-lines. The average yearly consumption may be given as 26,000,000 barrels, fully three-fifths of which is exported as crude oil and its products, principally illuminating oil. Table VIII. gives the monthly shipments of petroleum from the oil regions of Pennsylvania and New York. These shipments are accepted as representing the consumption during the years 1876 to 1888 inclusive:

TABLE VIII.—Monthly and Yearly Consumption.

Stocks.—Previous to 1870 there were no important accumulations of crude petroleum, and the total stocks at the end of 1873 had reached only 1,625,157 barrels. At the end of 1874 there had been an increase to 3,705,639 barrels, but at the end of 1875 this had been decreased to 2,751,758 barrels. During the next two years there was little change, but from 1878 the increase was almost unchecked until the maximum of nearly 40,000,000 barrels was reached during 1885. The accumulations had become burdensome, and the immense iron tanks of the various storage and pipe-line companies were taxed to their utmost capacity. Since August, 1885, there has been a gradual decline in the stocks, which during these three years has amounted to about 18,000,000 barrels. Table IX. gives the amount of crude petroleum, in barrels, in tanks and pipe-lines at the close of each month in the years 1876 to 1888 and the yearly average:

PETROLEUM PIPE-LINES. A descriptive and historical account of the petroleum pipe-lines must necessarily be a history of petroleum transportation, that the reader may obtain a clear understanding of the subject. Very early in the history of the petroleum industry the transportation problem became the most important question, next to the marketing of the oil, to the producer. As all the refineries were located in the city of Pittsburg, Pa., the crude oil as produced at the wells had to be transported to that city, and the cost was fully one-half of the amount realized for the oil. The oil at the wells was placed in barrels made of heavy oak staves and bound with iron hoops. These barrels were coated on the inside with glue, but as crude petroleum invariably contained a small percentage of water this coating of glue did not prove a complete protection, and at times the loss through leakage was serious. These barrels were purchased at a cost of \$3.50 each. A barrel in every respect superior is now made at a cost of \$1.25 to the refiners. The only means of transporting the oil was on wagons drawn by horses, and as the roads were new and for the most part in execrable condition, the hauling of the oil from the wells to the points of shipment on Oil Creek was at times attended with great difficulties. During the first few years of the petroleum industry the teamster exacted his own terms. As the only channels through which oil could reach the market were Oil Creek and the Allegheny River, when the wells came to be located farther from these water-ways the cost of hauling the oil to them increased. Pithole was the shipping point for the oil produced on the Miller farm, only four miles distant, and for carting the oil this distance the teamsters charged \$3 per barrel, and at times even more. Carting oil was the most profitable occupation in the oil regions during the early history of petroleum, and the foundation of many a fortune was laid through the extortionate charges made by the teamsters.

The oil when it arrived at the creek was placed on flat-bottom boats or on rafts and floated down with the current, but as for a great part of the time there was not sufficient depth of water to float the boats or rafts with their cargoes of oil, recourse was had to damming the stream and so accumulating sufficient water to carry the boats and floats beyond the shallows and obstructions. At times there were large accumulations of boats at the points of shipment awaiting a sufficient accumulation of water, and when the dams would at length be opened the rushing of the waters would render control of the boats impossible as they were swept down with the current in inextricable confusion, and frequent collisions and wreckages were the result. During one of these pond-freshets on Oil Creek from 20,000 to 30,000 barrels of oil would be sent through to Oil City. The empty boats were towed up the creek again by horses, who made their way along as best they could, at times along the bank, but for the greater part of the way wading in the stream. At Oil City the barrels of oil were transferred to larger boats. At one time there were upward of 1000 boats and 30 steamers engaged in this traffic. The losses occasioned by collisions and jams were serious and they were of

frequent occurrence. During a freshet in May, 1864, a jam occurred at Oil City, wrecking many boats and occasioning a loss of upwards of 25,000 barrels of oil. Bulk-barges were early introduced on the Allegheny and Ohio Rivers, and these, in an improved form of construction, are still used to convey oil to refineries located along the river. These bulk-boats were at first crude affairs, ill calculated to withstand turbulent river travel, but are now built with eight compartments with water-tight bulkheads, and of a capacity to carry 2000 barrels of oil.

The railroads entering the oil regions early saw the necessity of providing improved means for the transportation of the rapidly increasing amounts of oil seeking transportation facilities, and during the latter half of the year 1865 the tank car was introduced. At first the tank car was simply the ordinary flat car, upon which were securely fastened two wooden tanks with a combined capacity of about 4000 gallons. It was not until the year 1870 or 1871 that the wooden tank car was displaced by the car with a tank constructed of boiler-iron. These cars are still in use for transporting crude oil and the various products of the still. The tanks vary in size, holding from 4000 to 5000 gallons. They are, of course, safer than the wooden ones formerly in use, and are in every way better adapted to the purpose. A number of the larger refiners of petroleum own tank cars, and in this they are encouraged by the railroads.

These difficulties in transportation and great expense of cartage of the oil from the wells to the points of shipment early attracted the attention of engineers and others who sought means to overcome the difficulties and reduce the enormous cost of marketing the product. The earliest attempt to solve the problem by the use of iron pipes to convey the crude oil from the wells was made by Mr. J. L. Hutchinson, of New York, although Gen. S. D. Karns, of Parkersburg, W. Va., suggested the practicability of this mode of transportation early in the autumn of 1860. In 1862 Mr. Hutchinson constructed a line of pipe on the Tarr farm, where the first flowing well had been struck the year before, to the first refinery erected in the oil regions, at Plumer. The wells were on one side of a high hill and the refinery on the other. Mr. Hutchinson believed that a line of pipe laid from the wells over the hill to the refinery would, on the well-known syphon principle, draw the oil over the hill to the refinery. This plan proved a failure. The next year Mr. Hutchinson laid a pipe-line from the famous Sherman well to the terminus of the railroad at the Miller farm, a distance of three miles. To overcome the hydraulic pressure of a column of oil of that length he placed air chambers, similar to those used on hydraulic rams, 10 inches in diameter, along his pipe-line at intervals of 50 or more feet to equalize the pressure. The pressure did not burst the pipes, but although 1000 barrels of oil were emptied into them at the well barely 50 barrels reached their destination. The pipes were of cast-iron with lead sockets, and the joints were brought together with the blow of a mallet. Pumps were used to force the oil through the pipes. The slightest disturbance

of the pipe at the joints would cause a leak, and to this cause was due the failure of the scheme. Mr. Hutchinson was a firm believer in the eventual success of this manner of transporting oil, but although he continued his experiments two years longer he was unable to overcome the mechanical difficulties.

The first successful pipe-line was laid by Samuel Van Syckle, of Morris co., N. J. Early in the history of petroleum developments he went to Titusville. He struck an important well at Pithole, and as he was compelled to pay the teamsters \$1500 dollars per day to haul his oil to Miller's farm, a distance of five miles, he determined to improve on Hutchinson's experiments with pipes as a means of transporting his oil. In 1865, having conceived the idea of joining the pipes with a screw and thimble, he carried it out on a line of four miles in length from Pithole to Miller's farm. The pipe was laid two feet under ground, and as an ascent of 600 feet had to be overcome the feat was declared impossible of accomplishment. When all was completed the pumps were started, and soon a steady stream of oil was pouring into the tanks at the other end of the line, proving the pipe-line theory a success and marking the beginning of a new era in petroleum transportation. The teamsters realized that pipe-lines would prove the ruin of their business and, determining to resist the encroachments of the new invention, tore up the pipe-line as fast as Van Syckle could relay it, but he placed armed watchmen along his line, and after many sanguinary conflicts between the teamsters and the pipe-line men the former finally abandoned their hostile endeavors to check the march of progress. In the fall of the same year Henry Harley, a civil engineer, a graduate of the Troy Polytechnic School, began the construction of a pipe-line from Benninghoff run to Shaffer farm, which he completed in the spring following, and secured control of the Van Syckle line. Later, the firm of Abbot & Harley purchased enough of the Western Transportation Company's stock to control the charter, and organized under it the Allegheny Transportation Company.

The first effort to construct a pipe-line to the seaboard was made by Henry Harley. In 1875 he procured a charter for a company known as the Pennsylvania Transportation Company, which was authorized to construct a pipe-line from the oil regions of Pennsylvania to tidewater. The plan was generally regarded as the extravagant idea of a disordered brain, but was pronounced feasible by eminent engineers, and ample support being given, the transportation company built lines in the producing regions, but later the company was absorbed by a rival. As early as 1877 the oil regions were traversed by ten pipe-lines belonging to as many different companies, and competition to secure the carrying trade reduced the rates to such an extent that the business was no longer profitable. The certificates issued by these companies to the producers, which were equivalent to warehouse receipts, had only a local value, while the solvency of some of them was openly questioned. At this time the pipe-lines were dealers as well as custodians and carriers of oil, and as losses were inevitable under the system then in vogue, some of the companies were crowded out, entailing heavy losses on the producers. The situation became more and more complicated and uncertain, and it appeared that the solving of the transportation problem had but brought new difficulties. This was the situation when the United Pipe-Lines Company was organized, and relief followed quickly. The certificates of the new concern became known as representing the oil actually held in stock, and became negotiable in all the principal trade centres, where their value and safety have never been questioned. At this time all the crude oil transported from the oil regions to New York, Philadelphia, Cleveland, Pittsburg, and Baltimore was by railroad in tank cars. Following the consolidation and the organization of the United Pipe-Lines Company sprang up others in various sections of the oil

regions, but most of these were later purchased by the larger company or abandoned. At the end of 1888 the principal pipe-line companies are the National Transit Company, the successor of the United Pipe-Lines Company, and the Tidewater Pipe Company. There are several others having a local importance only, but their certificates are not sold in open market.

The construction of the long distance pipe-lines was commenced in 1880 by the United Pipe-Lines Company. The principal lines constructed were the Seaboard line, which extends from Olean, N. Y., to Saddle River, N. J., a distance of 300 miles; the Pennsylvania line, extending from Colegrove, Pa., to Philadelphia, the distance being 280 miles. The Baltimore line extends from Milway Station, on the Pennsylvania line, to Baltimore, the distance being 70 miles. The Cleveland line begins at Hilliards, Pa., and extends to Cleveland, O., a distance of 100 miles. The Pittsburg line extends from Carbon Centre, Pa., to Pittsburg, and is 60 miles long. The Buffalo line runs from Four Mile, Cattaraugus co., to Buffalo, and is 70 miles long. There are also several shorter supply lines in the oil regions which convey the oil to the several stations as required. The Seaboard line is a double conduit of 6-inch pipe and extends to the refineries at Bayonne, N. J., while a branch line crossing the Hudson River to New York city passes through Central Park at 64th street, across the city to the East River, and across that stream to the refineries at Hunter's Point and Newtown Creek on Long Island. There are in the oil regions of Pennsylvania and New York between 3000 and 4000 miles of iron pipe, which form a complete network of feeders to the mains or trunk-lines, taking the oil from the tanks at the wells and delivering it at the several stations. At the termini of the trunk-lines, and at the numerous stations, there are immense storage tanks with a capacity varying from 10,000 barrels to 38,000 barrels. Some of these huge tanks are of wood, but by far the greater number are made of boiler-iron. The standard adopted a few years since has a capacity of 30,000 barrels, is made of best boiler-iron, weighing about 80 tons, is 30 feet high and has a diameter of 86 feet.

The principal pipe-lines have no marked or important features differing the one from the other, although the topography of the country traversed varies greatly. A description of one only is therefore sufficient. The most important line has its oil region terminus at Olean, Cattaraugus co., N. Y., which has an elevation of about 1500 feet above the sea-level. The line consists of two 6-inch wrought-iron pipes, tested to bear a pressure of 2000 pounds to the square inch. These pipes are screwed together at the joints with couplings as are the ordinary gas pipes. In order that the pipes and the oil shall not be affected by every change in temperature and to partially overcome the extremes of heat in summer and of cold in winter, the pipes are buried under the surface of the ground to an average depth of about two feet. The pipes are laid in as nearly a straight line as possible, and follow the contour of the country, up hill and down, through forests, across swamps, through the streets of towns and villages, under rivers, across cultivated fields in a straight line to tide-water. At one point in Alleghany county the line overcomes an elevation of nearly 1300 feet within a distance of 4 miles. The route is along the southern boundary of the State of New York, through the counties of Cattaraugus, Alleghany, Steuben, Chemung, Tioga, Broome, Delaware, Sullivan, and Orange, and across the north-eastern portion of the State of New Jersey through Sussex, Morris, Passaic, Bergen, and Hudson counties. At central points in the valleys along the line the pumping stations are located. These stations consist of permanent buildings, a boiler-house and a pump-house, which contains the necessary machinery for pumping the oil, also a telegraph office. At each station are also located two or more of the immense iron storage tanks already described. In the

pump-house are compound condensing engines and pumps, two in number. Each pump has 28 suction-valves and the same number of supply valves. The stroke of the pump is double. At every stroke of the piston a barrel of oil is sent on its way, and a barrel of oil is forced forward every seven seconds, the pumps working day and night. A pressure-gauge indicates the pressure to which the pipes are subjected, and makes known at once any interruption in the flow through break or other cause. Another gauge records every stroke of the pump and shows the number of barrels of oil that have passed through the station. These pumping engines range from 250 to 1000 horsepower, according to the resistance the pumps are required to overcome. The stream of oil flows uninterruptedly day and night, stoppages occurring only when an accident necessitates a cessation of pumping to make repairs.

To each station there are allotted two engineers, two firemen, and two telegraph operators, one-half of the force working by day, the other by night. To detect possible leakages too small to be indicated by the pressure-gauge at the stations, each section of the line between stations is in charge of a lineman, who walks along the section once a week. Should a leak be discovered he at once sends word to the station. To remove sediment and deposits of paraffin, an automatic scraper is introduced into the pipes, the peculiar construction of which insures a thorough scraping of the inside of the pipe, the pressure of the oil forcing the scraper along from one station to the next.

When oil is received from the tanks at the wells the amount is ascertained by a joint measurement made by the representative of the owner of the wells and of the pipe-line, and is placed to the credit of the former on the books of the pipe-line company. Such oil is held in custody of the pipe-line company subject to the order of the owner, the same as are goods sent to a store-house, and the credit balance is negotiable the same as is a warehouse receipt. The producer's credit balances are held free of storage for thirty days, after which time the storage charge is 25 cents per day for each 1000 barrels. All oil when received from the wells becomes part of the common stock of the line, and no holder of a credit balance can therefore claim the identical oil produced at his wells. The certificates issued by the pipe-lines are usually for 1000 barrels, and those issued by the National Transit Company are the certificates sold at the several petroleum exchanges. The daily quotation of the price of petroleum is the price per barrel of 42 gallons, as represented by these certificates. (H. G. A.)

PETTENKOFER, MAX VON, a German hygienist, was born near Neuburg, Dec. 3, 1818. He was educated at Munich, worked in chemical laboratories at Würzburg and Giessen, and became chemical assistant in the royal mint at Munich. In 1847 he was made professor of chemistry there, and besides other technical improvements introduced a method for the preservation of oil-paintings. He afterwards devoted his attention to hygiene, and in 1865 he was made professor of this department in the Bavarian University. He investigated the influence of soils on public health and the causes of epidemics. He was one of the editors of the *Zeitschrift für Biologie*, in which most of his essays were published, from 1864 until 1883, when he transferred his labors to the *Archiv für Hygiene*. He has published *Populäre Vorträge* (3d ed., 1871), and a *Handbuch der Hygiene* (3d ed., 1882).

PETTIE, JOHN, a Scotch painter, was born at Edinburgh, in 1839. He was trained at the academy of that city, and in 1862 removed to London, where he had already exhibited some pictures. His works often present scenes of old English life. Among them are George Fox Refusing to take the Oath at Holker Hall, A. D. 1663 (1864); An Arrest for Witchcraft (1866); The Disgrace of Cardinal Wolsey (1869);

Juliet and Friar Lawrence (1874); Jacobites, 1745 (1875). Pettie was elected to the Royal Academy in 1873.

PETTIGREW, JAMES BELL, a Scotch anatomist and physiologist, was born at Roxhill, Lanarkshire, May 26, 1834. He was educated at the University of Glasgow, and graduated in medicine at the University of Edinburgh with the highest honors. He won the gold medal by his thesis, "On the arrangement of the muscular fibres in ventricles of the vertebrate heart." He was made Croomian lecturer by the Royal Society of London in 1860, and two years later became assistant curator of the Hunterian Museum, in the College of Surgeons. In 1867 on account of his health he resigned, and spent two years in Ireland. In 1869 he returned to Edinburgh as curator of the Anatomical Museum, and professor of pathology in the Edinburgh Hospital. In 1875 he was made professor of anatomy in the University of St. Andrews, and in 1877 he was elected by the Universities of Glasgow and St. Andrews as their representative in the General Council of Medical Education of the United Kingdom. His earliest investigations were directed to the muscles and nerves of the heart, and by his skill in dissection he solved many difficult problems in anatomy. In 1867 he first presented his novel theory of flight ("Figure of 8") which is fully shown in the article on "Flight" in the *ENCYCLOPÆDIA BRITANNICA*. For his celebrated work *Animal Locomotion, or Walking, Swimming, and Flying* (1873), he obtained a prize from the French Academy of Sciences. He has also published lectures on *The Relation of Plants and Animals to Inorganic Matter* (1873); *The Physiology of the Circulation in Plants, in the Lower Animals, and in Man* (1874), and *Man in his Anatomical, Physical, and Physiological Aspects* (1876).

PFEFFER, WILHELM, German botanist, was born at Grebenstein, near Cassel, March 9, 1845. He was educated at Göttingen, Marburg, Würzburg, and Berlin. In 1871 he began to lecture on botany at Marburg, and two years later was called to professorship at Bonn. He has since been professor at Basél (1877), Tübingen (1878), and Leipsic (1887), being also a director of the botanical garden of the last two. He has made contributions to morphology, but in the department of vegetable physiology he has rendered the greatest service to science. Besides many important essays he has published *Handbuch der Pflanzenphysiologie* (2 vols., 1881-82). Since 1881 he has published *Untersuchungen aus dem Botanischen Institut zu Tübingen*, in which valuable researches by himself and his scholars have appeared.

PFLEIDERER, OTTO, a German theologian, was born at Stetten, Sept. 1, 1839. He was educated at Tübingen University, and after a year's service as a village pastor returned to the University as repetent. In 1868 he became city pastor at Heilbronn, and in 1870 superintendent at Jena, where he was soon made professor of practical theology. In 1875 he was called to Berlin as professor of systematic theology. He belongs to the most advanced critical school. He has published *Die Religion, ihr Wesen und ihre Geschichte* (2 vols., 1869); *Moral und Religion* (1871); *Religionsphilosophie auf geschichtlicher Grundlage* (1878), of which an English translation appeared in London in 1886; *Grundriss der christlichen Glaubens- und Sittenlehre* (1880). In the department of New Testament criticism he has published a notable essay on *Paulinismus* (1873), and has contributed much to Hilgenfeld's *Zeitschrift*. In 1885 he delivered the Hibbert lectures in London on *The Influence of the Apostle Paul in the Development of Christianity*.

His brother, EDMUND PFLEIDERER, born Oct. 12, 1842, was also educated at Tübingen, and after service as preacher and teacher in various places, returned there as professor of philosophy in 1878. He has published some books on Leibnitz, a volume of remin-

iscences, and essays on modern pessimism and the golden age.

PHELPS, AUSTIN, theologian, was born at West Brookfield, Mass., Jan. 7, 1820. He graduated at the University of Pennsylvania in 1837, studied theology at Andover and New Haven, and was ordained pastor of the Pine Street Congregational Church, Boston, in 1842. He was made professor of sacred rhetoric in the Andover Theological Seminary in 1849, and retired from this position in 1884. He has given much attention to church music and published time-books for churches and Sunday-schools. His other publications are *The Still Hour* (1859); *Hymns and Choirs* (1860); *The New Birth* (1867); *Theory of Preaching* (1880); *Men and Books* (1881); *English Style in Public Discourse* (1883); and collections of his contributions to periodicals under the titles *My Portfolio* (1883), and *My Study* (1885). Dr. Phelps's writings are marked by purity of style, breadth of view, and genial conservatism.

His wife, **ELIZABETH STUART PHELPS** (1815-1852), the daughter of Prof. Moses Stuart (q. v.), was married in 1842, and died Nov. 30, 1852. She wrote *The Sunny Side* and other books for Sunday-schools, generally under the name "Trusta."

Their daughter, **ELIZABETH STUART PHELPS**, born at Andover, Aug. 31, 1844, wrote several books for the young. Her most noted work is *The Gates Ajar* (1868), which by somewhat novel views of the future state attained great popularity. A latter work, *Beyond the Gates* (1884), was in the same line of thought. In *Doctor Zay* (1883) the question of professional life for women is considered. Others of her books are *Hedged In*; *The Silent Partner*; and *The Story of Avis*. She was married to Rev. Herbert D. Ward in October, 1888.

PHELPS, JOHN WOLCOTT (1813-1886), general, was born at Guilford, Vt., Nov. 13, 1813. He graduated at West Point in 1836, and became second lieutenant of artillery. He served against the Indians in Florida and on the frontier until 1846, when he took part in the Mexican war. He resigned from the service in 1859, but in May, 1861, was made colonel of the First Vermont Volunteers, and then brigadier-general. After brief service in Virginia he went with Gen. Butler's expedition against New Orleans, and assisted in the capture of the forts defending that city. For undertaking to arm negro slaves as soldiers he was declared an outlaw by the Confederate government. When the Union authorities also countermanded his act he resigned his commission in August, 1862, and returned to Brattleboro, Vt. He took much interest in the educational and historical interests of the State, but was especially noted for his active opposition to secret societies. In 1876 he was nominated for President by a convention of the "American" party on this ground, but he received very few votes. He died at Royalton, Vt., Nov. 20, 1886. Among his publications were *Good Behavior* (1880); *History of Madagascar* (1884); and *Secret Societies, Ancient and Modern*.

PHELPS, OLIVER (1749-1809), deserves record as the author of the system of survey by townships and ranges, which has been adopted for the U. S. government lands. He was born at Windsor, Conn., and trained to business pursuits. During the Revolutionary war he was in the commissary department of Massachusetts. In 1788, in company with Nathaniel Gorham, he purchased from that State a tract of 2,600,000 acres in Western New York, being portion of a still larger tract which had been ceded by New York to Massachusetts in 1786. Phelps opening at Canandaigua, N. Y., the first land-office in America, commenced his system of survey, which proved admirably adapted to the condition of the Western country. (See PUBLIC LANDS.) In 1795 he was associated with William Hart and others in purchasing from Connecticut the "Western Reserve" in Ohio,

comprising about 3,300,000 acres. He resided at Canandaigua, became a member of Congress 1803-5, and a judge of the Circuit Court. He died at Canandaigua, Feb. 21, 1809.

PHELPS, WILLIAM WALTER, politician, was born in New York city, Aug. 24, 1839. His father, John J. Phelps, made a large fortune in business and railroad management. William graduated at Yale College in 1860 and at the Columbia Law School in 1863. He quickly obtained extensive practice, but after his father's death in 1869 he was obliged to devote much time to the management of his estate. In 1872 he was elected to Congress from a New Jersey district, and was sent on a committee to investigate affairs in Louisiana. The Legislature of that State was organized in accordance with the committee's decision. After serving several terms in Congress Mr. Phelps was sent in 1881 as U. S. Minister to Austria, but retired the next year and was reelected to Congress. He has taken an active part in the affairs of Yale University, and has delivered several important speeches.

PHILADELPHIA, the chief city of Pennsylvania, and the second in the United States, See Vol. XVIII. has been well described in the *ENCYCLOPEDIA BRITANNICA*; this article Am. Rep.). will, therefore, treat chiefly of its statistics and of the changes introduced in recent years, with incidental mention of some particulars overlooked.

Buildings.—Great advances in street architecture have been made within recent years. The City-Hall was completed, so far as the elevation is concerned, on May 7, 1887, the tower having reached a height of 337 ft. 4½ in. Above this an iron dome, octagonal and 200 ft. in height, is to be surmounted by a colossal figure of William Penn, 36 ft. high. The clock story is to be decorated by four groups of figures representing Swedes and Indians. When this tower reaches its total height, 537 ft. 4½ in., it will be the highest structure in the world save the Washington monument. (For illustration see Vol. I., Plate III.) Already (1888) several city and county officials and commissions occupy rooms in the hall. The total estimated cost of the building is \$15,000,000, and \$11,853,352 had been expended at last report.

Of recent private structures in Philadelphia the finest is the white marble Drexel Building at Fifth and Chestnut streets. It contains 400 rooms, covering upwards of 190,000 ft. of floor surface. The Stock Exchange occupies the second story of its east wing. The Bullitt Building in Fourth street, the warehouse of Hood & Bonbright on Market street, and the adjoining Girard Estate building are imposing edifices. At no former period of her history have so many fine banks and offices of trust and insurance companies been erected in Philadelphia. Mr. Henry C. Lea has built, at an expense of \$50,000, an annex to the Philadelphia Library, which will be ready for the reception of books in January, 1889. In October, 1888, the cornerstone of a new library building of the University of Pennsylvania was laid. In 1886 the new Homœopathic (Hahnemann) College, Dispensary, and Hospital on Broad street was opened.

The Academy of Fine Arts in 1886 received a permanent endowment fund of \$100,000. Philadelphia has recently acquired two fine bronze equestrian statues, one in Fairmount Park to Gen. G. G. Meade, executed at a cost of \$25,000 by Mr. Calder; the other to Gen. John F. Reynolds, who fell at Gettysburg. Other military monuments are, that to Union soldiers, dedicated in 1883, in Germantown; and that on the Girard College grounds, sacred to the memory of its graduates who fell in the civil war. Philadelphia has sent several patriotic monuments to the fields of Gettysburg and Antietam. Philadelphia, during the civil war, contributed for the maintenance of the Union 88,000 men and expended \$8,500,000.

Among Philadelphia's prized relics of the revolu-

tionary era is the Liberty Bell, cast in London in 1752 for the "Province of Pennsylvania," and bearing the inscription, "Proclaim liberty throughout the land to all the inhabitants thereof. Lev. xxv. 10." It was first used in 1753, and on July 8, 1776, saluted the first public reading of the Declaration of Independence. It was finally cracked on July 6, 1835, while being tolled for the funeral of Chief-Justice Marshall. The bell was lent to New Orleans for its World's Exposition in 1884, and since its return hangs on its old frame in the southern corridor of Independence Hall.

On Sept. 15-17, 1887, the centenary of the framing and adoption of the Constitution was celebrated by civic, military, and industrial parades. The U. S. government, with 17 States and the District of Columbia, contributed to the display.

Government.—The original charter of Philadelphia had undergone various changes before the Consolidation Act of 1852, which brought the whole county (nearly 130 square miles) under one city government. The vastly increased outlay for municipal purposes then rendered necessary gave frequent opportunities for jobbery, while the control of public works was chiefly with committees of the city councils, in which responsibility for maladministration was vague and uncertain. After the burden had grown oppressive the citizens sought relief from the State Legislature, which fixed the limit of the city debt at \$70,000,000, and required the expenditures to be kept strictly within the bounds of annual appropriations, whose total should not exceed the estimated income. Another measure of relief was the granting of powers for specific purposes to boards or commissions composed of prominent citizens. Eventually, however, these independent commissions aggravated the evils they were intended to cure. After various attempts at reform in management under the existing laws, the Legislature authorized the governor to appoint a Committee on Municipal Reform. Mr. John C. Bullitt, a member of this committee, drafted an important bill remodelling the city charter. This bill was, in 1883, introduced into the Legislature by his son, William C. Bullitt, then State Senator, was passed in 1885 and took effect April 1, 1887. Pursuant to this bill the mayor, who formerly was hardly more than chief of the police, has authority to administer nearly the entire city government through various departments, the heads of which are subject to his appointment and removal. These departments are those of Public Safety, Public Works, and Charities and Correction. There are also Departments of Receiver of Taxes, City Controller, and Law, whose chief officers are elected by the people, while the Board of Education is composed of members appointed by the Judges of the city courts.

Public Safety.—This department, with a Director appointed by the Mayor at a salary of \$7500, comprises the bureaus of Police, Fire, and Public Health. The police force consisted in 1888 of 4 captains at \$1350 each; 8 detectives at \$1080; 28 lieutenants at \$1092.50; 70 house sergeants at \$960; 14 patrol sergeants, 14 patrol drivers, 14 patrol officers; 4 pilots; 4 firemen; 5 van-drivers; and 1270 policemen at \$2.38 a day, the total cost of the bureau being \$1,751,710.08. The number of arrests in 1886 was 53,409; number of station-house lodgers, 54,589; number of commitments to prison in 1887, 28,968; to House of Correction, 5841.

The Brooks High License Bill, passed by the State Legislature in May, 1887, fixed the price of license for the sale of liquor at retail in large cities at \$500, and gave the judges large discretion in granting licenses. The License Court in Philadelphia in 1888 granted only 1340 licenses, while the former number of saloons was 5980.

Fire.—In bygone years Philadelphia was famed for its volunteer companies of firemen. In March, 1871, the volunteer system was changed for a paid fire-

department, and this, in 1887, fell under the Department of Public Safety. In 1888 the apparatus of this bureau consisted of 34 steam-engines, 2 chemical engines, and 7 trucks, operated by 34 engine-men at salaries of \$1000 each; 34 firemen at \$867.70; 41 drivers and 7 tiller-men at \$867.70; 41 foremen at \$1100; and 342 hose and ladder-men at \$867.70 each. The number of fires in 1887 was 1222, involving a loss of \$2,857,456, with insurance of \$12,287,301.

Health.—In 1887 there were 24,113 births; 6355 marriages; and 21,719 deaths, of which 8321 were under five years, the percentage of deaths to population being 2.21.

Public Works.—The head of this department is a Director appointed by the Mayor, with a salary of \$7500, and under it are comprised bureaus of gas, water, and highways. In 1886 Philadelphia had 855 miles of gas-pipes; the total number of consumers was 114,386, using 1,886,599 lights. The public lights numbered 15,410. The total gas made was 2,946,407,000 cubic feet. The cost of manufacture was \$3,494,472, the receipts, \$4,659,783, the surplus being applied to the payment of interest on loans, the sinking fund, etc. On April 1, 1887, the gas trustees reduced the price to \$1.50 per 1000 ft.

The principal streets of the city are brilliantly lighted by electricity, which is also liberally used in the larger stores and warerooms. Girard College, since May, 1887, has been illuminated with 35 electric lights upon 7 towers, each 125 ft. high.

Water.—The water pumped into the city reservoirs in 1887 amounted to 32,426,779,765 gallons, giving a daily average of 88,840,492, and, assuming the population to have been then 998,000, a daily per capita allowance of 98 gallons. In 1886 the total receipts of the bureau were \$1,993,328, the cost of operating the works, \$552,454. The total length of pipes laid up to 1887 was 852 miles, and the average length laid annually for the 11 years preceding 1888 was 15 miles. Through the agency of the Philadelphia Fountain Society there are now 61 public drinking-fountains in the city.

Streets.—In 1886 there were in Philadelphia over 2000 miles of highways, of which 900 miles were paved, the greater portion with cobble stones. Formerly this style of pavement was universal, but now a yearly appropriation is made for the replacement of cobble-stones with improved materials, as Belgian blocks and asphalt. The expenditure of the department for 1887 was \$1,010,061, the cost for street-cleaning being \$314,022, yet the condition of the streets in respect to paving and cleaning leaves much to be desired. The total length of sewers was 300 miles.

Almost every leading street, except Broad, is traversed by a car-track, double or single, making not less than 300 miles of street railways, employing some 9000 horses. The uniform rate for a ride is 5 cents and 8 for extreme distances. On Oct. 1, 1884, steam-traction or cable-motor cars began to be run. Now this system has over 20 miles in full operation, with 591 passenger-cars. An electric car built in Philadelphia made an experimental trip on Aug. 4, 1887. It was propelled by means of storage-batteries in the car. The pavements of the streets on which car-tracks are laid are required to be kept in repair between the curbs by the several street-road companies, but this condition is but indifferently carried out and is a source of constant bickering.

In 1888 the total number of dwelling-houses in the city was 274,835, and of stores having dwellings attached 1386. The total number of building permits issued from 1885 to 1887 (both years inclusive) was 21,243, the value of buildings of all descriptions erected in 1887 being \$45,000,000. The new schools erected in the above three years were 39; factories, 212.

Finances.—On Sept. 1, 1887, the city controller estimated the expenses of the departments for 1888 at \$17,110,188.18, exclusive of legal obligations amounting to \$4,438,089.93, the full amount to be provided

according to estimate being \$21,220,253.18. Valuation of taxable property for 1888 was \$647,213,039, a net increase of \$18,533,527 over 1887. Estimated revenue of 1888 from all sources other than current taxes \$8,956,094.78, among these being \$4,000,000 from the gas department and \$1,925,000 from the water department. In order to meet all liabilities a tax-rate of \$2.89 would be required; a rate of \$1.85 yielding only \$10,805,324.86, or \$6,304,863.33 less than the departments ask. Councils, notwithstanding, voted a tax of only \$1.85, and the appropriations were reduced accordingly. On Aug. 1, 1887, the funded debt of the city was \$58,252,720.22; the excess of debt above securities being \$33,967,785.75.

Banking.—In July, 1888, Philadelphia had 42 National banks with a total capital stock of \$22,297,122, and a reserve of \$27,012,700, and deposits amounting to \$76,493,400. Of 18 State banks the capital stock was \$11,450,123; the specie in banks \$6,635,382; deposits, \$2,632,646. A marked feature of Philadelphia banking of recent years has been the establishment of the trust and safe deposit companies, which combine with the general features of banking, offices hitherto confided to individuals, such as the administration of estates, acting as guardians, the direction of various trusts for the benefit of individuals or corporations, etc.

Post-office.—The Philadelphia post-office is the finest U. S. government building out of Washington, affording accommodations not only for its own proper department but also for the internal revenue and pension offices, for civil service examinations, for the U. S. Courts, the railway mail service, the light-house board, signal service station, etc. The receipts of the post-office for year ending June 30, 1888, were \$1,871,786.49; the expenditure, \$782,279.89. The total number of employés was 880. The letter-carriers numbered 513, an increase of 95 since 1885, and the aggregate number of pieces handled in the year was 326,388,247, or an average of 636,234 by each carrier. The money order receipts were \$4,436,928.16.

Schools.—The public schools, in 1887, numbered 460, comprising a Normal School, a High-School, a School of Practice, a Manual Training School, a School of Industrial Art, 21 Night Schools, and 68 Grammar Schools; the remainder being Secondary and Primary Schools. The number of teachers was 2425 and of scholars 110,279. The expenditure of this department for the year was \$2,028,279, and the money invested in grounds, buildings, and furniture amounted to \$7,660,629. A new Catholic High-School of white marble is in course of construction at Broad and Callowhill streets.

Harbor and Marine.—The entries into the port of Philadelphia in 1887 were 1377 vessels from foreign ports with a tonnage of 1,302,196, and 4414 coasting vessels, tonnage not given. Of the latter 1539 were steamers. The clearances were 1055 foreign vessels, tonnage 975,097; and 4805 coastwise. Of the vessels entering from foreign ports 333 were American, of which 17 were steamers, and 1047 foreign, of which 538 were steamers. Of the clearances for foreign ports 224 were American vessels, 15 being steamers, and 843 foreign, 307 being steamers. Of the 4805 clearances coastwise 1819 were steamers. The amount of receipts at the Custom House was in 1885, \$13,918,553.66; in 1886, \$16,303,918.77; in 1887, \$17,950,235.10. The statement of vessels belonging in the district of Philadelphia on June 30, 1888, is shown in the following table:

Sailing vessels (wood),	405.....	gross tonnage,	100,282.69
“ “ (iron),	5.....	“ “	2,891.28
Under 20 tons,	71.....	“ “	950.15
			104,124.12
Steam-vessels (wood),	99.....	gross tonnage,	19,723.39
“ “ (iron),	93.....	“ “	47,695.81
Under 20 tons,	74.....	“ “	1,651.56
			68,070.76

The total exports from the port of Philadelphia in 1887 were to the value of \$33,813,024, of which \$16,865,042 were to Great Britain. The imports were of the value of \$39,570,687, of which \$16,744,437 were from Britain. The Clyde line of steamers, inaugurated by Thomas Clyde in 1842, with one steamer running to New York, operates about 60 steamships and occupies 1000 ft. of wharves along the Delaware. The ship-building works of William Cramp & Sons are especially noted. In 1854 the total tonnage of vessels launched and on the stocks in the 9 ship-building yards then in the city was 13,797. On Sept. 1, 1888, the tonnage of steamers under construction in Cramp's yards was 24,214, the horse-power 44,200. Five of the vessels were for the U. S. government, namely, the Baltimore (cruiser, launched October, 1888), of 4400 tons displacement, and a guaranteed horse-power of 9000; the Yorktown (gun-boat), 1700 tons, horse-power, 3000; the Vesuvius (dynamite-gun cruiser) 700 tons, horse-power, 3500, guaranteed speed, 20 knots; the Philadelphia (cruiser), 4400 tons, horse-power, 9500, guaranteed speed, 19 knots; the Newark (cruiser), 4083 tons, horse-power, 8500. Three other great vessels were on the stocks for private firms. In 1882 fourteen establishments gave employment to in all 2848 hands. Cramp's yards alone now employ 2200.

The channel of the Delaware at Philadelphia is seriously obstructed by two islands, Smith's and Windmill. For preliminary survey in regard to the removal of these islands the U. S. government in 1888 appropriated \$100,000, on condition that the city or State should purchase the title to the islands.

The number of immigrants arriving at Philadelphia in the year ending June 30, 1888, was 37,018, of whom 11,543 were English, 7987 Irish, and 5062 Germans.

Railroads.—In 1886 the receipts of the Philadelphia and Reading Railroad were \$29,343,998 and its expenditure \$16,450,338. The freight carried was 27,748,325 tons, the number of passengers 25,600,760. Its mileage is 327; the number of its engines operated 943, and of its cars 57,354. In 1887 these numbers were largely reduced owing to the great strike in the coal region. The figures for the Pennsylvania Railroad for 1887 were, receipts, \$115,515,506; expenditure, \$77,238,082; freight, 106,128,215 tons; passengers, 68,153,705; engines, 1349; cars, 32,101.

In August, 1886, the Baltimore and Ohio Railroad entered Philadelphia, having completed its Schuylkill East Side road to a new depot at Twenty-fourth and Chestnut streets. From the Schuylkill it passes through a tunnel 5700 ft. long to Poplar street, where it connects with the Reading Railroad. On being released from its receivers early in 1888, the Reading Railroad applied to Councils for leave to extend its line into the business heart of the city by an elevated terminal from Ninth and Green streets to Twelfth and Market. The project has met with considerable opposition and is not yet finally decided. A north-eastern elevated railroad is also projected, its route being from Tacony to League Island, with a branch to Jenkintown. Other efforts have been made to introduce elevated railroads.

Industries.—The census returns of industries, made in 1880, were so obviously incomplete as to lead to a revised census being taken in 1882 under the supervision of Mr. Lorin Blodget, an experienced statistician. His census for the iron industry shows 712 establishments (including rolling-mills, foundries, pipe- and bolt-factories, machinery and steel-works, etc.), employing in all 31,917 hands; the wages paid being \$15,160,175, and the gross product \$58,608,781. The leather trade numbered 100 establishments, employing 2752 men and 730 women and youths, with a product of \$10,712,800. The lumber, furniture, and cognate manufactories yielded a gross product of \$28,325,531. In 1887 there were 130 brewing establishments, producing 1,569,661 barrels yearly, of the total value of \$11,772,458. Mr. Blodget's return shows that the total

number of manufacturing establishments within the city in 1882 was 12,063, employing 242,483 hands, and paying wages amounting to \$83,965,518. The gross value of the product in that year was \$481,226,309.

In 1888 Claus Spreckels, of San Francisco, erected an extensive sugar-refinery on the Delaware River, covering between 9 and 10 acres. The works will have a capacity of 2,000,000 lbs. of sugar daily, employing from 700 to 1000 hands.

Voters.—On Sept. 26, 1888, the county commissioners made return of 232,311 registered voters, an increase of 3219 over the number in 1887; the total vote, Nov. 6, 1888, was 205,444. (J. H.)

PHILIP, KING (d. 1676), an Indian chief noted in New England history, was the son of Massasoit, sachem of the Wampanoags, who had formed a league with the Pilgrims, at Plymouth, Mass., in 1621. Massasoit continued friendly to the end of his life in 1661. Then his two eldest sons, Moanum and Pommetacon, going to Plymouth, requested English names, and the court called them Alexander and Philip. Alexander dying within a year, Philip became sachem. He resided at Pokanoket, and for a time maintained friendship with the whites as his father had done, but in 1670 there were rumors of his disaffection, so that in the next year an attempt was made to disarm the Indians. Sassamon, a converted Indian, who had given information of the hostile movements of the tribe, was killed, and, when his murderers were tried and executed, the Indians slew several whites. Philip, seeing that the steady advance of the whites was due to their unity of action, prevailed upon the Narragansetts and other tribes to form an alliance to exterminate the English settlers. But the colonies of Massachusetts, Connecticut, and Plymouth made still closer connection to repel the common danger. Capt. Winslow, in December, 1675, marched with 1000 men against the stronghold of the Narragansetts, and destroyed it with all their provisions for the winter. The war raged with greater fury in the following spring. Altogether, 13 towns, with 600 buildings, were destroyed, and 600 colonists slain. But the Indians were overpowered, and Philip, deserted, sought refuge at Mount Hope, R. I. Even here he was pursued by Capt. Benjamin Church, and slain Aug. 12, 1676. His body was quartered, and his head was long exposed on a gibbet at Plymouth. Church published a *History of the war* (1716; republished 1865).

PHILIPPIANS. See **ROMANS, EPISTLE TO THE.**
PHILIPPOTEUX, FÉLIX EMMANUEL HENRI, French historical painter, was born at Paris, April 3, 1815. He studied under Cogniet, and in 1833 exhibited his first painting, a scene from the American revolutionary war. His next was *The Retreat from Moscow* (1835), then followed *The Taking of Ypres* (1837), and *The Death of Turenne* (1838). After a visit to Algiers in 1840, he painted many scenes of Algerian life. Among his noted works are *Louis XV. Visiting Field of Fontenoy* (1840); *The Last Banquet of the Girondins* (1850); *Charge at Balaklava* (1859); *Siege of Puebla* (1865); *Meeting of Henri IV. and Sully* (1875). He also produced the remarkable panorama of the *Siege of Paris*. His works have achieved great popularity, due to their exhibition of the pomp and circumstance of war and to their precision in details, but he cannot be said to display in any high degree true artistic feeling.

His son, **PAUL PHILIPPOTEUX**, born in Paris, Jan. 27, 1846, after studying in the *École des Beaux Arts* and with Cogniet and Cabanel, assisted his father in preparing the *Cyclorama of the Siege of Paris*, and afterwards exhibited it in several American cities. He made a similar representation of the *Battle of Gettysburg*, which has been exhibited at New York, Philadelphia, and other cities. He also prepared *Cycloramas of the Falls of Niagara* and of the *Battle of Tel-el-Kebir* for exhibition in London, and of the *Siege of Plevna* for St. Petersburg. Several of his paintings of

war scenes and historical subjects have been exhibited at the Paris Salon. In 1888 he exhibited in Boston a series of thirty large paintings illustrating the career of Gen. Grant. His recent works have been illustrative of American history.

PHILISTINES. The valuable article on this subject in the *ENCYCLOPÆDIA BRITANNICA* See Vol. XVIII. correctly says that the Bible represents the Philistines to have been immigrants (Am. ix. 7; Jer. xlvii. 4; Deut. ii. 23; Gen. x. 14). Its correctness is open to question, however, when it affirms, on the strength of 1 Sam. xxx. 14; Ezek. xxv. 16; Zeph. ii. 5; 2 Sam. viii. 18; xv. 18, etc., that "the Philistines, or a part of them, are also called in the Bible Cherethites," and that David's celebrated "Cherethites and Pelethites" were Philistines. It is at least as natural to understand these passages as representing that the Cherethites were a different people, living to the south of the Philistines.

The statements found in Gen. xxi. 32, 34; xxvi. 1, 8, 14, 15, 18; Exod. xiii. 17; xxiii. 31; Josh. xiii. 2, 3; Jud. iii. 3, etc., to the effect that the Philistines were already in their seats in the Mediterranean lowland in the time of Abraham, and that they lived there from that time on, are indeed "inconclusive" from the point of view of those who reject these statements as unhistorical; but from any other point of view we must regard this evidence as dating the Philistine immigration at a time not later than Abraham. The Book of Joshua says that Joshua conquered all this lowland region, but specifies the Philistine cities as exceptions (x. 40, 41; xi. 16; x. 29-34; xii. 11-15; xv. 11, 38-47, etc.; cf. xi. 22; xiii. 2, 3). Except, therefore, on the basis of the wholesale rejection of the existing evidence, it is a mistake to say that "the first real sign of the presence of the Philistines is when the Danites, who in the time of Deborah were seated on the sea-coast (Jud. v. 17), were compelled—obviously by the pressure of a new enemy—to seek another home far north, at the base of Mount Hermon (Jud. xviii.)." There is nothing in the history to justify the inference that the migration of the Danites to Laish was caused "by the pressure of a new enemy;" the enemy which, at some date or other, pressed the Danites to the hill country, is expressly said to have been not the Philistines but the Amorites (Jud. i. 34, 35); and the migration to Laish occurred before the death of Phinehas, the high-priest (Jud. xx. 1, 28), and consequently a generation or more earlier than the times of Deborah. The first real sign of the presence of the Philistines, according to the testimony of the Bible, which is all the evidence we have in the case, is in the times of Abraham; the first appearance of the Philistines as the oppressors of Israel is in the times of Deborah herself, and not in the earlier times when the Danites took Laish.

The careful reader of the Bible will find the following statements to be true, though they differ alike from those made in the article in the *BRITANNICA* and from most of the opinions currently held. The Biblical records represent that there were four periods of Philistine oppression of Israel before the reign of David. The first was in the time of Shamgar and Deborah (Jud. iii. 31; v. 6, 8). It is again mentioned, by way of reminiscence, in Jud. x. 11. The accounts of it are very meagre, but the statement that Shamgar's weapon was an ox-goad, and Deborah's asking whether there was shield or spear among 40,000 in Israel, suggest the existence of a state of things like that which existed afterward in the time of Saul (1 Sam. xiii. 19-22); and thus suggest that the Philistine oppression of Shamgar's time was very effective and severe. The fact of such an oppression over the southern tribes existing at that time affords a better explanation than those commonly given for the absence of Judah from Deborah's roll-call of the tribes (Jud. v. 14-18).

The second Philistine oppression is mentioned in Jud. x. 7, in connection with the administration of

Jair, and as preceding the Ammonite oppression of eighteen years, from which Jephthah delivered Israel. (See ISRAEL.) This second Philistine oppression is probably that of the times of Samson; the traditional opinion, which identifies the times of Samson with those of Eli, is not well grounded. In regard to this oppression not much is told us apart from the personal exploits of Samson, but we are informed that in Samson's youth the Philistines were recognized as lords of Judah (Jud. xv. 11), coming up into the country on slight provocation, while toward the close of Samson's life, after he had been twenty years judge, the Philistines seem to have found it necessary to entrap him across the border in order to attempt anything against him (Jud. xvi.). It therefore seems that Samson actually accomplished a deliverance for Israel, as it had been promised he should (Jud. xiii. 5).

The third Philistine oppression was that of the times of Eli. The rescue from this under Samuel was complete, and lasted for many years (1 Sam. vii. 10-14). The fourth Philistine oppression began in the reign of Saul, after Saul had been so long on the throne that his son Jonathan had grown to be a warrior (1 Sam. xiii. 3 seq.). At first the Philistine success was complete, but later Saul maintained himself against them with greater or less success until the overwhelming defeat at Gilboa, where he met his death.

The statement that "Philistia was never a part of the land of Israel" is hardly consistent with 2 Sam. viii. 1, 12; 1 Kings iv. 21, and many other statements in the record. The account in the Bible seems to be that the Philistines became tributary to David, and remained under tribute to his descendants till the times of Jehoshaphat and Jehoram (2 Chron. xvii. 11; xxi. 16). After the division they naturally belonged to the southern kingdom, as their territory was a part of that of the tribe of Judah. The fact that we have two accounts of sieges of Gibbethon by the kings of northern Israel does not at all justify the inference that "the house of Ephraim . . . laid claim to the suzerainty over Philistia." The fact that Ahaziah of Israel sent to inquire of a Philistine god (2 Kings i.), or the fact that the Shunamite woman went to sojourn in the land of the Philistines (2 Kings viii. 2) do not necessarily prove that the Philistines were then entirely independent of Judah. But evidently they had then already become politically important. The revolt in the time of Jehoram of Judah soon followed (2 Chron. xxi. 10, 16). Shortly afterward the dynasty of Omri was overthrown by Jehu, who took the throne as the vassal of Shalmaneser II., of Assyria. At the same date the dynasty of David was for six years displaced from the throne of Judah by Athaliah. After this, when we first hear from the Philistines (Am. i. 6-8, et al.) they seem to be independent of Judah.

The contact of the Assyrians with Philistia does not begin with Tiglath-pileser (B. C. 734). Shalmaneser II. says that he took tribute from all the kings of the sea-coast, Tyre being expressly specified, and the Philistines very likely being included. However this may be, his grandson, Rimman-nirari III., whom the Assyriologists date as reigning B. C. 812-783, but whose date would be some forty years earlier by the chronology found in the margins of most Bibles, the contemporary of Jehoahaz and Jehoash of Israel, explicitly claims suzerainty over the Philistines. See Smith's *Chronology*, p. 115, or Schrader's *Cuneiform Inscriptions*, translated by Whitehouse, p. 203-206. In the times of Jeroboam II. and Uzziah, when the Assyrian power was broken in all these regions, Uzziah partially re-established the power of Judah over the Philistines (2 Chron. xxvi. 6, 7). Under his grandson, Ahaz, they again became hostile (2 Chron. xxviii. 18; Isa. ix. 12), and from that time on they mingled prominently in the struggles in which Judah, Egypt, Assyria, and Babylonia were engaged. (W. J. B.)

PHILLIMORE, SIR ROBERT JOSEPH (1810-1885), an English jurist, was born in London, Nov. 5, 1810.

He was educated at Westminster School and Christ Church, Oxford, graduating in 1831. He was afterwards clerk in the Board of Control, was called to the bar at the Middle Temple, and became Queen's Counsel. Besides having extensive practice in civil courts, he was made chancellor of the dioceses of Chichester and Salisbury. He was elected to Parliament from Tavistock in 1853 and took an active part in legislation pertaining to ecclesiastical affairs. In 1862 he was made advocate-general in admiralty and received the honor of knighthood. In 1867 he was made Judge of the High Court of Admiralty and of the Arches Court of Canterbury, being then sworn of the Privy Council. After holding other offices he was in 1875, on the reorganization of the courts, nominated judge of the admiralty and probate division of the High Court of Justice, which office he held till his death, Feb. 4, 1885. As a writer his fame rests on his valuable *Commentaries upon International Law* (4 vols., 1854-61). He also published *Memoirs of George Lord Lyttleton* (2 vols., 1845); *Ecclesiastical Law of the Church of England* (3 vols., 1873); an annotated translation of Lessing's *Laocöon* (1874), and several treatises of temporary interest.

His daughter, CATHARINE MARY PHILLIMORE, has written *The King's Namesake* (1872); *Thoughts on Marie Antoinette* (1873); *Pictures from the Early History of Venice* (1874); *Scenes from the Life of Savonarola* (1881), and has edited the *Edison Basilike* (1879), which she maintains to be the work of King Charles I.

PHILLIPS, WENDELL (1811-1884), orator, was born at Boston, Nov. 29, 1811. His father, John Phillips (1770-1823), was chosen first mayor of Boston in 1822. Wendell graduated at Harvard College in 1831 and was admitted to the bar in 1834. His natural gifts, social advantages, and scholarly training seemed to mark him out for conspicuous success in the usual course. But his destiny was swayed by his profound moral character, moved by the peculiar circumstances of his city, State, and nation. Boston was a centre of wealth and refinement, but still more was it a city of merchants. The commercial spirit guided its action, when, on Oct. 21, 1835, a mob of gentlemen gathered to break up an anti-slavery meeting presided over by a woman. Their wrath had been especially roused against George Thompson, an English anti-slavery lecturer, but when he escaped, they seized and dragged through the streets with a rope the non-resistant William Lloyd Garrison. The sight of this infuriated, well-dressed mob stirred Phillips' moral nature to its lowest depths, and this pure-souled, high-born lawyer joined in spirit with the persecuted abolitionist. Two years of thought and study passed before he was prominently identified with that cause. A meeting was held in Faneuil Hall on Dec. 8, 1837, to make on behalf of Boston a protest against the murder of Rev. Elijah P. Lovejoy at Alton, Ill., who had been killed by a mob while defending the printing-office of his anti-slavery newspaper. Rev. Dr. Channing made an impressive address and proposed resolutions, when Mr. J. T. Austin, State attorney-general, who had come with others to divert the meeting from its purpose, strenuously objected. Phillips was called on to reply and at once overwhelmed the apologist for murder with a torrent of indignant eloquence. But the moneyed aristocracy of Boston closed their doors in the face of the champion of abolitionists. He never faltered. He adopted Garrison's view of slaveholding as a sin, personal and national, and immediate emancipation as a duty. Believing that the U. S. Constitution by its compromises recognized and supported slavery, he gave up his legal practice and even the exercise of the elective franchise as contaminating. But he used all the more the mighty power of the platform and the press. He spoke without pay wherever he had a chance to be heard on his chosen topic. For addresses on other subjects he was paid, but he generally turned the proceeds into a fund to advance the cause

to which he had consecrated his life, his fortune, and his honor. The power of steady, systematic agitation he afterwards acknowledged he had learned from the example of Daniel O'Connell. Phillips' eloquence and devotion profoundly influenced public opinion throughout the North, though the number of professed abolitionists always remained small. Other causes operated to hasten the national crisis. At last war came, not from the North against slavery, but from the South against the Union, which the slaveholders rejected as an insufficient safeguard of their peculiar institution. Then Phillips urged with renewed emphasis on the Northern people and their leaders the expediency and duty of emancipation. Only after twenty months' struggle to avoid resorting to this momentous war-measure did President Lincoln issue his emancipation proclamation, Jan. 1, 1863. But Phillips still condemned the administration as sluggish and dilatory and opposed Lincoln's re-election. In 1865, when the war was brought to a triumphant close, Garrison proposed that the American Anti-Slavery Society, of which he had been president for thirty years, should be disbanded as having accomplished its object. But Phillips insisted in prolonging its work until the negro should have the constitutional right of suffrage. He was its president from that time until 1870, when it dissolved. Part of its later work was to secure the removal of race distinctions in public institutions and conveyances and in all places of public resort. Phillips had from his first entering the ranks of the Abolitionists urged the admission of women to their societies on equal terms, and he pleaded in their behalf at the World's Anti-Slavery Convention in London in 1840. The close of the war gave leisure to many whose energies had been therein occupied, and the cause of women's rights received a great access of numbers and enthusiasm. Phillips was still a prominent advocate of this and other social changes. His sympathies were manifested in behalf of the Indians, who had been cheated and oppressed both under the treaties made with their tribes, and in violation of such treaties. The perennial sufferings of the working classes became also the subjects of his consideration. He became an ardent champion of temperance, and even of State Prohibition. In 1870 he was nominated by a convention of Prohibitionists for the governorship of Massachusetts. A few years later he advocated the governmental issue of an irredeemable paper currency. In this Greenback movement he came to agreement with another Massachusetts man, whose career otherwise presents a striking contrast with his own—Gen. Benjamin F. Butler. But little effect, however, was produced by the movement except Gen. Butler's election to the governorship, when the Greenback party was merged in the Democratic. But another noteworthy event marked the seventieth year of the veteran agitator. In 1881 his Alma Mater, who had so long shown marked coldness towards her noble son because of his denunciation of popular evil, so far relaxed her severity that he was called to make the address on the centennial anniversary of the Phi Beta Kappa Society. His Puritanic conscience compelled him even then to say some things hard to listen to, but the oration was worthy of the man and the place. He delivered his last public address on Dec. 26, 1883, and died at Boston Feb. 2, 1884. (J. P. L.)

PHILLIPS, WILLARD (1784-1873), lawyer, was born at Bridgewater, Mass., Dec. 19, 1784. He graduated at Harvard College in 1810, and was tutor there until 1815. Having been admitted to the bar he practised law in Boston until 1845 with conspicuous success. He was employed by a legislative commission in codifying the criminal law of Massachusetts, and from 1837 to 1847 he was county judge of probate. Thereafter he was president of the New England Mutual Life Insurance Company until his death, Sept. 9, 1873. He was a contributor to the *North American Review*, and for some years editor of the *American*

Jurist. He was associated with Edward Pickering in editing *Reports*, prepared legal treatises on insurance and patents, and published a *Manual of Political Economy* (1828) and *Protection and Free Trade* (1850).

PHILLIPSBURG, a city of New Jersey, in Warren co., on the Delaware River, opposite Easton. It is on the Belvidere-Delaware Railroad, which here connects with the Morris and Essex and the New Jersey Central Railroad. Two railroad bridges cross the river here. Phillipsburg has two banks, seven churches, a high-school and other schools, and a weekly newspaper. There are several iron-foundries, a rolling-mill, boiler- and locomotive-works, and other iron-works. Its population in 1880 was 7181.

PHILPOTTS, HENRY (1778-1869), English bishop, was born at Gloucester in 1778. He was educated at his native town and at Corpus Christi College, Oxford, where he graduated in 1795 and was then elected a fellow of Magdalen College. He was made one of the chaplains of Rev. Dr. Barrington, bishop of Durham, in 1806, afterwards prebendary of Durham Cathedral. In 1828 he was made dean of Chester. He had opposed Canning's plan of Roman Catholic emancipation and was consulted by the Duke of Wellington in regard to the act for that purpose passed in 1829. He was made bishop of Exeter in 1830 and was thenceforth the official leader of the High Church party in all the controversies of a stormy period. In 1849 he refused to institute the Rev. Mr. Gorham in a church living on the ground of his denial of baptismal regeneration. The judicial committee of the Privy Council, however, decided in Mr. Gorham's favor, but when the Archbishop of Canterbury carried out the decision, Bishop Philpotts anathematized the archbishop. He wrote an abundance of controversial pamphlets but no work of importance. He died at Bishopstoke, Sept. 18, 1869.

PHIPS, or PHIPPS, SIR WILLIAM (1651-1695), colonial governor of Massachusetts, was born at Woolwich, Maine, Feb. 2, 1651. His parents had twenty-six children, of whom twenty-one were sons. In boyhood he was a shepherd, but at the age of eighteen bound himself to a ship-carpenter, and in 1673 he removed to Boston, where he learned to read and write. Going to England in 1684 he obtained from the Admiralty the use of a vessel to recover the treasures from a Spanish wreck, near the Barbadoes, but was unsuccessful in this first attempt. In 1687 a second was made with the aid of the Duke of Albemarle, and treasure was recovered to the amount of £300,000, of which Phips' share was £16,000. His partners also procured for him the honor of knighthood, and he was appointed high-sheriff of New England. In May, 1690, he captured Port Royal in Nova Scotia, but in October his fleet of thirty-four sail was three days too late to capture Quebec, reinforced in the meantime by Frontenac. While in England in 1692 he was appointed governor of Massachusetts through the favor of Increase Mather, the colony's agent in England. He returned to Boston in May, where his administration was made notorious by the delusion of the Salem witchcraft. Phips, a member of Cotton Mather's congregation, for a time willingly followed his pastor in the hideous persecution, but finally issued a general pardon to all accused of witchcraft. There had been a strong opposition to his government, and in 1694 he was summoned to England to answer the complaints brought against him. He died suddenly at London, Feb. 18, 1695.

PHOENIXVILLE, a borough of Chester co., Pa., is on the S. bank of the Schuylkill River, 28 miles N. W. of Philadelphia. The Pennsylvania and the Philadelphia and Reading Railroads pass through the town. The former has here a branch-road to Frazer, and the latter has the Pickering Valley branch. The extensive iron- and steel-works of the Phoenix Iron Company and the Phoenix Bridge Company give employment to 2400 men. Several fine bridges erected by these companies span the Schuylkill River and French Creek in

the vicinity. Phoenixville has two national banks, 1 daily and 2 weekly newspapers, 10 churches, manufactures of cotton goods, stockings, pottery, needles, shirts, and boiler-works. The borough was incorporated in 1849. It has gas- and water-works, and is free of debt except the water-loan of \$220,000. Electricity is used to light the iron-works. Near the town is a beautiful cemetery containing a monument to the soldiers who fell in the civil war.

PHOSPHATES are the compounds formed by the union of basic bodies with phosphoric anhydride, P_2O_5 . Of these much the most important, and the one to which our attention will be confined, is phosphate of lime, $3CaOP_2O_5$, which forms the principal constituent of several minerals, especially of *APATITE* (*q. v.*), and is the basis of all bones and horns. Phosphorus, indeed, occurs in nature principally in the form of phosphate of lime, from which it is usually derived. Thus combined it appears to be an essential element of plant food, concentrating itself particularly in the seeds of plants, whence it enters into the food of animals, to which it is perhaps even more necessary.

Lime phosphate occurs in many forms in the superficial deposits of the earth's surface, and is the basis of most of the artificial fertilizers which are now so largely manufactured, and of the natural manures which are applied without special preparation to the soil. It is, for instance, an important constituent of guano, whose value depends very largely on the percentage of lime phosphate which it contains. It also forms a minor constituent of the marls which occur in such abundance in this country, vast deposits existing in New Jersey, and in a broad belt running parallel to the coast from South-east Virginia to the western limit of Georgia, and thence across Alabama into Mississippi. The percentage of phosphates in these marls is small, yet it is sufficient to add considerably to their value as fertilizers.

Far the most important deposits of phosphates, however, are those which are known as "phosphate rock" which exists abundantly in South Carolina and elsewhere. The marl beds near Charleston, S. C., are overlaid by a stratum of what was formerly supposed to be nodules of limestone, and was thrown aside as useless in the mining of these marls. These "marl stones" were hard, rounded concretions, from the size of a potato to a diameter of several feet, and had evidently gained their rounded form by rolling in water. In 1867 Dr. St. Julian Kavenal was induced to examine them, and quickly discovered that they contained phosphate of lime to the important extent of 55 to 60 per cent. The announcement of this fact was followed by the discovery that, in addition to the known deposits, the rivers near Charleston flowed over beds paved with this rock. So far as has been ascertained the beds of phosphate rock underlie an area 70 miles in length and 30 miles in greatest width, and are practically inexhaustible as sources of fertilizing material. The State receives a royalty on all phosphate rock removed from navigable streams, the quantity paid on in 1886 being 191,174 tons. Nearly the whole of this river rock is shipped to foreign and domestic ports, the South Carolina phosphate-factories using the land rock almost exclusively. In 1884 there were 40 such companies, engaged in crushing the rock into fertilizing material.

Similar deposits exist in North Carolina, in which State a special survey made in 1884 disclosed nearly 150 separate beds of phosphate nodules. These are found in a belt of territory 15 to 20 miles wide, and extending from the Neuse River to the South Carolina boundary. It runs parallel to the coast and from 20 to 25 miles inland. Similar rock has also been discovered in Florida, occurring in the north-western part of the State, and also near Gainesville, in the central region. In places these beds are 6 to 8 feet thick.

The phosphates here described are of animal origin, and belong to the early tertiary age of geology. Phosphatic deposits of cretaceous age have been found in Alabama and Mississippi, and taken as a whole the American phosphate-beds promise to be of immense value to agriculture. In addition to the natural phosphatic fertilizers the manufacture of artificial ones is an industry of considerable importance. For a description of these see **FERTILIZERS**. (C. M.)

PHYLLOXERA (*Phylloxera vastatrix*, Planchon). In 1865 Prof. J. E. Planchon, of Montpellier, France, announced the discovery of the fact that the disease of the grape-vine, which had attracted much attention in the south of France around the mouth of the Rhône, was due to the work of a minute plant-louse on the roots. It had previously been described under three different generic names in its apterous form, but it was properly placed by Planchon in the genus *Phylloxera* and given the specific name of *vastatrix*. In 1854 Dr. Asa Fitch of New York had described an American grape-leaf gall-louse under the name of *Pemphigus vitifoliae*, and in 1869 M. J. Lichtenstein of Montpellier, France, suggested that this species might be identical with *P. vastatrix*. Acting upon this suggestion, Prof. C. V. Riley, then State Entomologist of Missouri, in 1870 established the identity of the two insects, and in 1871 proved the existence of the root-inhabiting form in this country, announcing, in the *Fourth Missouri Entomological Report*, that there is every reason to believe that the failure of the European vine in this country and the partial failure of the hybrids of our vines with the European, as well as the deterioration of the tenderer native varieties, are chiefly due to the work of this insect. Prof. Riley's conclusions as to the identity of the American and European insects were proven correct the same year by European observers, and were again confirmed by Prof. Planchon in 1873 when he visited this country under a commission from the French government. The most important result of his visit was the dissipation, to a great extent, of the prejudice existing against the American vine in France and the confirmation in his official report of all the more important facts and conclusions previously announced by Prof. Riley, especially as to the resisting power of many of the native American vines. A standing reward of 300,000 francs offered by the French government for an efficient remedy has stimulated an enormous amount of experiment in that direction. Journals were founded devoted to this one subject, and an extensive literature on the subject has grown up since 1869.

The native home of the Grape Phylloxera is the North American continent east of the Rocky Mountains, and extends from the Gulf of Mexico to Canada. From this region it has been introduced into Europe and, recently, into California. It exists in two forms, the one in galls on the leaves—called by Riley *gallicola*—and the other on the roots—*radicicola*. In the gall-making form the species exists only as an agamous, apterous and very prolific female, with a smooth skin. The galls are transient, and may be abundant one year and very scarce the ensuing year on one and the same vine. The root form closely resembles the gall-making individual at birth, but deviates later by acquiring tubercles (see illustration). The insect passes the winter in the so-called "winter-egg" state, either above or below ground, or it hibernates as a young larva, darkened in color and flattened in form, on the roots, where it can scarcely be distinguished. In the following spring the winter-egg gives birth to a wingless, agamic female, which Riley calls the "stem-mother," and which may start a colony either in a gall on the leaves or on the roots, the former being the more common habit. Late in summer there is produced from the root-feeding form a generation of winged agamic females, which fly abroad and spread the species. Each of these winged females lays from 3 to 8 delicate eggs, most often in or on the ground at the base

of the vine or occasionally on the lower surface of the living leaf. They are so delicate as to require especially favorable conditions to enable them to hatch. From these eggs, which are of two sizes, come the only true sexual individuals—males and females—the males from the smaller eggs and the females from the larger. They are born without mouth-parts and take no food. The female, after having been impregnated, lays a single egg, which is the only directly impregnated egg produced in the life-cycle of the species, and which is usually secreted under the loose bark of two-year-old cane, and there hibernates. Such is the usual round of life of the species, the exception being that the wingless hypogean females may occasionally bring forth the sexual individuals without the intervention of the winged generation.

Phylloxera vastatrix: a, healthy rootlet; b, rootlet with swellings caused by *Phylloxera*; c, do. with swellings rotting; d, lice on larger roots; e, pupa; f, g, winged female—hair-lines showing natural size.

The insect spreads from vine to vine in the wingless state, but the winged individuals—the immediate precursors of the sexual individuals—are capable of quite extended flight, and spread the species from vineyard to vineyard. It may also be carried to remote districts in the winter-egg on cuttings.

The grape-vine most susceptible to the attacks of the root form of the phylloxera is the European *Vitis vinifera*. Of the native American varieties the most susceptible—the Catawba, Delaware, and the Goethe—belong to the Northern fox-grape (*Vitis labrusca*). The hardiest and most resisting species among the bunch-grapes belong to *Vitis aestivalis*. The gall form is found most abundantly on the wild winter- or frost-grape (*Vitis cordifolia*), and least abundantly on the European vine (*V. vinifera*). The symptoms of the disease above ground are a sickly yellowish appearance of the leaves and a reduced growth of the cane. This is visible only during the second year of the attack, and about the third year the vine usually dies. The symptoms below ground the first year consist of swellings on the rootlets; the second year of the rotting and disappearance of the fibrous roots and the settling of the lice upon the larger roots, which rot away during the third year.

The natural enemies are quite numerous, though

they are principally found preying upon the gall-inhabiting form. The remedies tried have been almost innumerable. The most effectual so far experimented with is the use of bisulphide of carbon, inserted by means of a special injector, one of the best being that

Phylloxera vastatrix: a, swellings on roots; b, newly hatched root-lice; c, d, its antenna and leg; e, f, g, forms of more mature lice—natural size indicated at side.

invented by M. Gastine, and known by his name. Sulfo-carbonate of potassium is the next remedy that has so far been used; about a pint to 40 gals. of water is employed to each vine, poured into a circular trench around the vine. Petroleum emulsion, i. e., two parts of kerosene emulsified in one part of sour milk, and this mixed with from 40 to 100 parts of water, and used in a similar manner, is recommended as still more satisfactory. Submersion, where practicable, the use of rich fertilizers, the adoption of the American resistant varieties—like Taylor, Clinton, Jacques, etc.—as stocks upon which to graft susceptible varieties, are the most satisfactory.

(C. V. R.)

PHYSICAL EDUCATION. In very remote periods a definite association was recognized between health, longevity, and physical exercise, and this became a little later an integral part of the creed and the civilization of all the most powerful nations of the world, many of whom owed to its recognition their most brilliant successes in both warlike and artistic pursuits. In Greece, especially, the cultivation of the body by means of gymnastics begun in the earliest life of the individual, fostered and encouraged by the enormous rewards in both fame and riches accruing from success at the Olympic games, and aided by a rigid application of the principles of heredity, eliminating almost completely those persons unfit for the founding or propagating of families, resulted in the nearest approach to physical perfection in an entire people that the world has ever witnessed. Aristotle considered a commonwealth essentially defective if gymnastics were not a part of its code, while Plato called him a cripple who, cultivating his mind alone, suffered his body to "languish through sloth and inactivity." The labors of gymnastics, he very truthfully says, if excessive, may make men hard and brutal, but under proper restrictions they stimulate the spiritual element of their nature, make them courageous, and bring their passions under control.

The Greek gymnasia were not only schools for the cultivation of the body, but exerted the greatest influence upon the development of art and upon intellectual progress. The idea ever present to the minds of the Greeks that the first care of life should be the preservation of bodily health, without which all other advan-

tages of mind, of rank, of fortune, became void and ineffective, resulted in the establishment of an ideal of physical beauty and excellence which reacted upon their art, their manners, their entire civilization, and made them in certain directions pre-eminently superior to the rest of the world. Personal hygiene, and what we now call physical culture, had already attained with them the dignity of a science. The god of physicians was the presiding deity of the gymnasia, and none were considered so well qualified to regulate this branch of education as those best acquainted with the art of medicine. Their five favorite exercises—constituting the pentathlon—running, leaping, wrestling, hurling the lance, and casting the discus, were admirably adapted to supplement one another in developing the body and conferring a high degree of strength and vigor, together with grace, celerity, and accuracy of movement. Whatever was needed in addition was supplied by their games of ball, by their practice in lifting and carrying weights, and by swimming, pugilism, and other athletic sports.

During the middle ages gymnastic and athletic proficiency became the almost exclusive property of the nobility and the professional soldiery, and was displayed only at tournaments and in actual warfare. Among those comparatively small classes it was, however, brought to a great degree of perfection, and it has been said that, even after the middle of the fourteenth century, the levy of a small German burgh could turn out more athletes than the combined armies of the empire.

It was not until the beginning of the present century that gymnastics became systematized or popularized among modern nations. In Germany Jahn established his gymnasium, or Turnplatz, at Berlin, in 1811, introduced new apparatus, improved the defective system of exercises, published a celebrated essay on the principles of gymnastics, and organized the *Turnvereine*, gymnastic societies which, apart from their occasional connection with political movements, have been of the greatest practical benefit not only to their members, but, by force of example, to the community. As a system of exercises is now employed for all the armies of the German empire, and as all able-bodied adult male citizens are required to give three years of personal military service, it is evident that nearly the whole male population of Germany enjoys the advantages of a systematic physical education at a period of life when training is most valuable and important. In Switzerland, Sweden, and France, societies analogous to the *Turnvereine* were formed, and finally government action was taken making gymnastic exercises compulsory in most of the educational institutions as well as in the army. In England, directly after the Crimean war, a commission was appointed to consider the subject, and upon its report a code of instruction in physical exercise was prepared by Mr. MacLaren, of Oxford, which is now in satisfactory operation at all the barracks of the British army.

In this country, although there are many excellent gymnasia in the large cities, it is only within the last decade, and then at but few of the more important colleges, that gymnastics have been regarded as more than a pastime for the younger males, or a prescribed and unpleasant remedy for some of the ailments of the older members of society. In 1881, in the Northern and Middle States, only three educational institutions in a thousand paid any official attention to gymnastics, athletics, or physical education. That this is not the proper position of athletics in an intelligent community has become evident to all thinking people; but there are comparatively few who realize the incalculable power for good which physical education, rightly understood, encouraged, and applied, could have upon the human race in years to come.

The excellent work and writings of MacLaren, Ralfe, Ball, Sargent, Hartwell, Blaikie, Oswald, Schaible and others, have done much to diffuse accu-

rate knowledge of its true value, and should be consulted by all who desire complete information on the subject.

Health consists, in a comprehensive sense, in such a condition of growth and development of all the organs of the body as enables them to fulfil their functions easily and completely, respond promptly to occasional unusual demands upon them, and resist effectually the attacks of disease. These unusual demands upon the energies of the body are continually occurring in everyday life, and should be of themselves sufficient inducement to all persons to aim at the highest attainable condition of health; but when we know that on a certain day or during a certain time such an exceptional demand will be made on the organism to put forth all its powers, we aim especially to prepare it to meet that demand, and such preparation, whether preliminary to the exploration of a continent, the vicissitudes of a campaign, the fatigue of a week's shooting, or the strain of a four-mile boat-race, we call "training." MacLaren has thus well defined training as a "method of putting the body with extreme and exceptional care under the influence of all the agents which promote its health and strength, in order to enable it to meet extreme and exceptional demands upon its energies." Ralfe defines it as "the art which aims at bringing the body into the most perfect condition of health, making muscular action more vigorous and enduring, and increasing the breathing power." Dr. Parkes says, "Training is simply another word for healthy and vigorous living."

Of the agents of health which are employed in the process of training, exercise is the most important, though food, drink, rest, sleep, air, bathing, and clothing are elements which must be carefully considered. To understand how exercise produces strength and health, we should remember that the life of the body as a whole depends upon the life of numberless atoms which constitute it, and which are continually dying, being cast off and replaced by others. The general health depends directly upon the activity of this process and the perfection with which it is performed. The pabulum or food which is needed by all the organs and tissues of the body for their repair or for their growth and development is carried to them by the blood. At every moment of our lives, whenever we make a movement, draw a breath, change a muscle of expression, conceive a passing fancy, certain cells die and are disintegrated, as a consequence. They become useless, and must be removed and carried to organs whose function it is to eliminate them from the body; new cells must be supplied to take their place. All this is done by the blood, which in performing this work becomes loaded with effete and useless material, much of which in the shape of carbonic acid is thrown off by the lungs. Now, this process is going on incessantly at every imaginable point in the human organism. Whether sleeping or waking, sitting or standing, walking or running, the same successive causes and effects continue to follow one another in the same unbroken circle of physiological phenomena—motion or activity, temporary and molecular loss of vitality, death of certain cells or atoms, disintegration of those cells, their removal and ejection from the system by means of the lungs, the skin, and the kidneys, their replacement by others brought by the blood, renewed vital power, and then further motion or activity, with the same succession of events. Taken as a whole, these events make up "life," and, reducing the statement to the simplest possible terms, we may say that the health and strength of any individual are in direct proportion to the thoroughness and celerity with which these occurrences take place; that is, to the speed and accuracy with which the cells or atoms are removed and replaced, or, as MacLaren says, to their "newness." Consequently, we are able to understand how an agent of any sort which influences these processes favorably must be one which will promote at the same time the

destruction of the old cells and their rapid replacement by new ones; in other words, one which, while it hastens the molecular death of certain tissues, will at the same time send them an increased amount of material with which to repair damages, or which may even enable them to improve upon and add to the original structure. Now, when we look for such an agent, discarding drugs, of course, as inapplicable and injurious, and assigning food to its proper place as fuel which may be transformed into force but is useless alone and unassisted, we find that there is but one means within our reach for effecting this purpose safely, continuously, and healthfully, and that is exercise. By "exercise" is meant certain movements made by means of the contraction of the voluntary muscles, and made with sufficient force and rapidity to quicken the breathing and the circulation of the blood, that is, to augment the action of the involuntary muscles concerned in those functions, chiefly the heart and the diaphragm. We understand what exercise thus essentially means. The force which moves the muscles employed in exercising is derived from the death or burning up of some of the cells of the body; this creates a need for the introduction of more oxygen into the system to unite with the carbon of these cells and produce this combustion; this increased quantity of oxygen is supplied through the lungs, which consequently have to expand much oftener than usual to meet the demand. This is the physiological and easily understood explanation of the fact that exercise is accompanied by quickened breathing. The increase that takes place in the quantity of air inspired under a variety of movements has been estimated as follows: Taking the amount of air inhaled at each breath in the recumbent position at 1, it rises on standing to $1\frac{1}{2}$; on walking at the rate of one mile an hour, to 1.9; at four miles an hour, to 5; riding at a trot raises it to 4.05; and swimming to 4.33. But it must be remembered that this oxygen thus brought to the lungs by the increased quantity of air inspired can be carried to the cells in the various tissues where it is needed only by the blood, which must, therefore, itself be sent to the lungs in greater amount to receive the oxygen and to give up the carbonic acid with which it is laden; in other words, when we exercise we not only breathe more quickly, but the heart beats more rapidly and forcibly. To make a similar comparison, we may say that while lying down the heart will beat 65 or 70 times a minute; on standing, 75 to 80 times; on walking slowly, 80 to 90 times; during fast walking, 90 to 100 times; and during or immediately after great physical exertion, as a boat-race or a running-match, from 115 to 125 times a minute.

These, then, as Ralfe has pointed out, are the two important facts to be remembered about exercise: that it increases the breathing-power, rids us of carbonic acid, and purifies our blood; and that it increases the action of the heart, sending a larger quantity of this purified blood to all the tissues of the body, removing their waste, supplying the material for their renewal, and quickening all the vital processes.

Exercise thus fulfils all the conditions that we have seen to be necessary in an agent which is to increase strength and health. As soon as any act of exercise is begun, a number of the voluntary muscles are put into action, their contraction compresses the blood-vessels and impels the venous blood actively towards the heart, which, thus spurred, contracts vigorously and sends the blood in increased quantity to the lungs. The inspiratory muscles contract and lift the bony frame-work of the chest, the diaphragm pushes down the contents of the abdomen, and air rushes into the lungs to fill the space thus produced and supplies the oxygen needed for the purification of the blood. This is then returned to the heart, to be distributed anew throughout the system, carrying with it the materials to supply the waste caused by the muscular movement originally made. These materials are often deposited in larger quantities than are required to counterbalance

the destruction which has taken place, and then we have the muscle growing in size, or in hardness, or both. The involuntary muscles also, including the heart and diaphragm, grow stronger in the same manner, the pulsations of the heart during exercise becoming more forcible but at the same time slower and less obtrusive, showing that it does its work more easily, the increased activity of the circulation carries the blood in larger quantity not only to the muscles but also to *all* the organs of the body, and thus stimulates them to greater activity, strengthening the appetite, digestion, and nutrition, and causing a gain in weight; the larger amount of blood sent to the skin results in an increase in the quantity of perspiration, which carries with it much of the worn-out and useless or noxious material of the system, and thus adds to the resistive power of the economy against evil influences from without, such as bad air from ill-ventilated rooms or dirty streets; the bony frame-work of the chest, though elastic, does not quite go back to its original dimensions, but, increasing a little at a time, soon becomes noticeably augmented in size, giving additional room for the important organs which it contains and protects.

These, then, are the effects of exercise—the most obvious but least useful being an increase in the size and power of the voluntary muscles, the more important being a strengthening of the involuntary muscles concerned in the processes of respiration and circulation, which enables us to use the increased power of the voluntary muscles with comfort and safety, and to influence through these processes not only the health and strength but also the growth and development of the whole body, and even the activity and force of the mental processes.

No system of exercise or of physical education is complete unless it recognizes the necessity which exists for attending to the *symmetrical* development of the contraction of the voluntary muscles, and the body. If, for example, a typical rowing-man, one who has been exclusively an oarsman, is carefully examined, it will be seen that his hips and thighs are developed at the expense of his calves; that the muscles of his back and loins are far stronger than his chest muscles; that his back arm and forearm somewhat exceed in development and hardness the front arm, though neither is noticeably developed. This condition indicates the proper exercises with which to supplement rowing in such a man, which will round him out, complete his development, add to his symmetry, and increase his general health and efficiency. He needs, obviously, running for his legs, the parallel bars for his chest, the rings or ladder for his upper arm; and this would be the advice which he would receive from a careful and intelligent trainer, to his great advantage not only as a man or an athlete but also as an oarsman. Further examples might be drawn from athletic sports to illustrate the general and important truth that no one exercise (nor, indeed, any series of the recreative and competitive exercises alone) will give complete and symmetrical development.

It is with this fact in mind that the systems of physical education now in use at Harvard, the University of Pennsylvania, and other American colleges, and long used at Oxford, have been devised, the plan being approximately as follows:

Each student is stripped and carefully examined as to his weight, height, the circumference of his chest, and the size and condition of his legs, thighs, arms, and forearms. The sum of these measurements, expressed in any convenient terms which may be selected, centimetres or feet, for example, is taken as an approximate indication of his development. It indicates, that is, with more or less accuracy (and particularly in men of immature years, in whom there is but little subcutaneous fat), the amount of working material which he possesses, though it fails to show the actual working value of that material.

Having recorded the development, the examiner proceeds to estimate the total available strength, and for this purpose applies a series of tests which show the strength and capacity of the lungs, and the strength respectively of the back, legs, thighs, arms, and chest, forearms and abdominal muscles. The sum of these is expressed in the same terms as those indicating the development, and can readily be compared with it. If the strength is in excess of the development, the condition is good, and the figures representing it have a plus value; if the reverse is the case, the condition is poor, and the figures have a minus value. The personal and family history is also ascertained and recorded.

The examiner is now in position to give advice, if it is required, upon a number of important topics. He can point out to the man inclined to be pigeon-breasted the value of the parallel bars or upright bars; he can suggest to the man with weak legs the rowing-machine or the river; he can instruct the man with the feeble or irritable heart to moderate his work, or can advise the man with flabby muscles, slow circulation, or undue accumulation of fat, to become more active in his exercises. He can go further than this, if need be, and can point out the proper diet to those of gouty or rheumatic parentage, the proper clothing to those inheriting a tendency to pulmonary trouble, and in fact can apply the general rules of hygiene or of preventive medicine to each individual case, with the advantage derived from the previous thorough and scientific inspection. It would be well, indeed, if every person in the community submitted to a similar examination by his family physician and received similar instruction. The effect of such a course in warding off preventable disease could hardly be overestimated.

These examinations are repeated from time to time, and the changes carefully noted. It has already been conclusively shown that not only are greater feats of strength accomplished when this system is properly followed, but that they are done with vastly greater ease and safety, owing to the symmetrical development of all parts. Tables made out at Harvard by Prof. Sargent (whose excellent papers on the subject are well worth study) and extending over five years show, for instance, taking the average of ten men as to "condition," and expressing the result in figures, that whereas in 1880 their strength was in excess of their development as 126 to 100, in 1884 the proportion had risen as 476 to 100; in other words, their condition in 1880 being taken at 126, it had in four years increased to 476, or nearly fourfold. The improvement may be made more readily comprehensible, perhaps, by taking a special example of physical exertion. In 1880 there was not a man among them who lifted over 393 pounds: that was the maximum. In 1884 the maximum was 675 pounds, while the minimum was 427, or 35 pounds more than the maximum of the first year. The concomitant improvement in health and vitality cannot be expressed in figures, but was no less marked.

This is the sort of athletic work which it seems most worth while to preach or prescribe to the world. Competitive athletics, though far less dangerous and much more beneficial than is generally supposed, cannot, for want of time and opportunity, be indulged in by the majority of men who have entered upon the real work of their lives. In college students their undue encouragement is objectionable on account of the one-sided and partial development which they bring, and because of the frequent distraction from college duties which they cause when the spirit of rivalry is allowed to become extreme. It is desirable to foster and preserve the manly games and sports in which for centuries it has been the pride of the Anglo-Saxon race to excel and to encourage their spread, not only among the students of our schools and colleges, but among the dyspeptic, nervous, and over-worked professional and business men produced in such enormous numbers by the

strain and hurry and exciting competition of our modern life. But, at the same time, the evils which surround these sports should be avoided, the risk of strain from lack of proper preparation, *i. e.*, of rational "training;" the risk of developing the competitive element until all things are sacrificed for success in one particular direction or event; the danger—especially to be guarded against in our colleges—of introducing the spirit of "professionalism," which looks rather at the prize now than at the means by which it was obtained; which abounds in quibbles and wrangles and unkind feeling; which reduces the masses to the position of spectators and develops a few specialists instead of a large number of general athletes. It should be understood that the main object and idea of exercise is the acquirement and preservation of health; that it is by far the most important therapeutic and hygienic agency at the command of the physician of to-day; that it can be prescribed on as rational a basis with as distinct reference to the correction of existing troubles or the prevention of threatened ones as any of the drugs of the pharmacopœia; that it increases not only the muscular strength and vitality but also the activity and vigor of the brain; that it augments incalculably the working power of the individual, and that it enables him, by means of the health and strength which it confers, not only to do better work than his business or professional rival who lacks these attributes, but also to do it more easily and safely, with the greatest amount of comfort and pleasure and the highest degree of usefulness to mankind. (J. w. w.)

PHYSICK, PHILIP SYNG (1768–1837), physician, was born at Philadelphia, July 7, 1768. His father had charge of the estates of the Penn family. After being taught at the Friends' Academy, he went to Europe to study medicine, and was private pupil under John Hunter. He was made house-surgeon to St. George's Hospital, obtained a diploma from the Royal College of Surgeons, and graduated at the University of Edinburgh in 1792. Returning to Philadelphia, he was soon made physician of the yellow-fever hospital during the epidemic of 1793, and one of the surgeons of the Pennsylvania Hospital. In 1805 he was made professor of surgery in the University of Pennsylvania, and in 1819 was transferred to the chair of anatomy, which he held for twelve years. He stood in the foremost rank of his profession as a surgeon, and was exceedingly popular as a lecturer. He was honored with membership in several medical societies of Europe. His only publications were in the medical journals. He died at Philadelphia, Dec. 15, 1837.

PIANO. The general history and construction of the pianoforte are treated at length in See Vol. XIX. the *ENCYCLOPÆDIA BRITANNICA*. This p. 64 (p. 72 article will therefore be confined to piano Am. Rep.). manufacture in America. The piano was already known and manufactured in Europe when this nation was still in its infancy. Yet the inventive genius of the American, once applied to this instrument, accomplished as much towards perfecting it as all the other nations put together. It is generally supposed that Benjamin Crehore, of Milton, Mass., made the first piano produced in this country. This was about at the beginning of the present century. Adam and William Bent were making pianos in Boston as early as 1803. In 1810 the brothers Alpheus and Lewis Babcock, who had learned their trade with Crehore, joined with Thomas Appleton and the Hoyts, music dealers, under the firm-name of Hoyts, Babcocks & Appleton. After the war of 1812 the Hoyts went to Buffalo, John Mackay taking their place. The firm was dissolved about 1820. John Osborne worked with this firm, and subsequently set up for himself, and with him Jonas Chickering (1797–1853) and Timothy Gilbert worked as journeymen. James Stuart, a Scotchman, who had the reputation of making an excellent piano, was associated for a time with Osborne, and later with Chickering. After the firm of

Hoyts, Babcocks & Appleton had been dissolved, John Mackay was associated for a few years with Alpheus Babcock. In 1830 Mackay formed a partnership with Jonas Chickering, which lasted until his death in 1841. Chickering had started in business for himself in 1823. He soon began introducing the improvements which have made his name famous, and the rapid perfection of the American piano is in a large measure due to him. Alpheus Babcock, of Boston, who afterward, and until his death, was foreman of the Chickering factory, had, in 1825, patented a cast-iron frame for square pianos. In 1833 Conrad Meyer, of Philadelphia, also exhibited a piano with a full cast-iron frame. Babcock's plan of construction was greatly improved and modified by Chickering, who, in 1837, made his first square piano with a complete iron frame, and three years later the first grand piano ever made with a full iron frame. About 1843 he took out a patent on an invention of great importance. This was the introduction of a cast-iron flange on the top of the plate covering the head-block, which flange was drilled for each string to pass through. This gave the strings a firm tendency upwards, and served at the same time as a transverse strengthening-bar. When grand pianos of this construction were sent to the International Exhibition of 1851, in London, they attracted considerable attention, and were awarded a prize medal. In 1856 this method of construction was superseded by the "agraffe" system now in use. According to this a solid iron flange is cast on the under side of the iron frame, into which the "agraffes" are screwed. In 1845 Chickering invented and first used the circular scale for square pianos. The improvements mentioned are only the most important of those introduced by him. After his death, in 1853, the business was carried on by his sons, under the old firm-name, Chickering & Sons. They have a large branch house in New York, in the same building with the well-known "Chickering Hall." The number of pianos that have come from their factory is about 75,000. The originator of the system of "overstringing," which Chickering did not adopt until 1853, is, it seems, not known. It has been claimed, however, that the first piano on this plan made in America came from the factory of John B. Dunham.

Among Chickering's competitors in Boston were Lemuel and Timothy Gilbert, and about this time a number of piano-makers were beginning to work in Albany. Among the first were Boardman & Gray and James A. Grovesteen. Later came Meecham & Pond, John Osborne, and others. Grovesteen went to New York in 1843, and retired from business in 1886. The prominent firms in New York at this time were R. & W. Nunns, who enjoyed an excellent reputation; Stoddart, Worcester & Dunham; Firth, Pond & Co., later Firth, Hall & Pond (the same Pond who was associated with Meecham in Albany); Bacon & Raven (established about 1840); William H. Gieb & Co.; Linden & Fritz, and Lindeman & Sons (established 1836). Henry Hazleton was an apprentice with Dubois & Stoddart in 1831. He and his brother were for a time with Bacon & Raven, but began business soon after that firm was established. When, some time before 1840, William Nunns left R. & W. Nunns, Charles S. Fischer entered the firm, which changed its name to Nunns & Fischer. Later, he and his brother, John W. Fischer, began conducting business together, under the name of J. & C. Fischer, by which the firm is still known. Frank and Napoleon J. Haines were apprenticed in 1839 to the N. Y. Pianoforte Manufacturing Company, and, in 1851, started in for themselves. One of our earlier musicians, William B. Bradbury, also began to manufacture pianos in 1854, in partnership with his brother, E. G. Bradbury.

A house that has played a prominent part in the growth and development of piano-making in this country is that of Steinway & Sons. Henry Engelhard Steinway (originally Steinweg), the founder of the firm,

was born in Germany in 1797. He was originally an organ-builder, but soon began making pianos on a small scale, exhibiting some as early as 1839. In 1850 he came with his family to New York, where, three years later, he established the house which bears his name. The business increased very rapidly, and, after repeated removals, the firm finally settled in its present quarters in 1863. Three years later the well-known concert-room, "Steinway Hall," in the same building, was opened to the public. In 1875 a branch house was opened in London, England, and in 1880 another in Hamburg, Germany. Charles and Henry, two of the sons, died in 1865, and the father in 1871. The business is now carried on by William Steinway, C. F. Theodore Steinway, and some younger members of the family. The firm has patented a number of inventions, among which the overstrung scale (1859); an agraffe arrangement for square and grand pianos (1859); the duplex scale (1872); and the tone-sustaining pedals (1874-75). Their instruments take high rank, and have gained honors whenever exhibited, notably at London in 1862 and 1885, and in Paris in 1867.

In 1833 William Knabe (1803-64) came to this country, and began to work in Baltimore, first under Hartge, and later alone. He and H. Gaehle went into partnership in 1839, under the name of Knabe & Gaehle, and when Gaehle died in 1855 Knabe continued the business, under the name of William Knabe & Co. This name it still bears, his sons, William and Ernest, and his son-in-law, Charles Keidel, constituting the present firm. The house manufactures a first-class piano, and its instruments are much in demand.

Another well-known house is that of Weber, also founded by a German. Albert Weber came to the United States in 1845, settling in New York. Seven years later he started in business for himself, but it was not until about 1871 that the business began to assume the large proportions to which it subsequently grew. When Weber died in 1879 he was succeeded by his son, Albert Weber, Jr., who, the following year, opened a branch house in Chicago. The house of George Steck & Co., of New York, was established in 1857 by George Steck, the senior partner. Among the improvements which Mr. Steck has introduced is one patented in 1870 in the frame of upright pianos. His instruments are favorably known, both in this country and Europe. One of the younger firms is that of Sohmer & Co., founded in 1872 by Hugo Sohmer and Joseph Kudor. They also have introduced several improvements in construction, among which the improvement of the "Allicot" system, by which they place the auxiliary tone-re-enforcing string above the other three, and arrange all the tuning-pins on one side. They have patented also an improved agraffe-bar for the upper three octaves of squares and grands (1882), a pianissimo pedal (1887), and an action in upright pianos for obtaining quick and certain repetition (1882). The firm gives much attention to upright pianos, in which it excels.

The firm of Decker Brothers, of New York, established by the brothers, David and John Jacob Decker, in 1862, has also introduced several notable improvements, and is still adding to its reputation. Myron A. Decker (not related to the members of the preceding firm) began business in Albany in 1856, and four years later came to New York. Here he worked for seventeen years, sometimes alone, sometimes in partnership with others, until, in 1878, he and his son formed the present firm of Decker & Son. Other firms of greater or less repute at the present day are Kroeger & Sons (Henry Kroeger came to New York in 1855, and was superintendent under the Steinways for 24 years); Ernest Gabler & Bro. (established 1854); Kranich & Bach; Calenberg & Vaupel (established 1858); Krakauer Bros.; Mathushek Piano Manufacturing Company; Vose & Sons (established 1851); F. Bräutigam; F. Schuler; Behning; and Behr Bros. & Co. (founded in 1881), all of New York. The Henry F. Miller &

Sons Piano Company, of Boston, Mass., was organized in 1884, succeeding Henry F. Miller, who had established himself as early as 1863; the Emerson Piano Company, and the Ivers & Pond Piano Company, also have their head-quarters in Boston. Many others, too numerous to name here, have arisen within recent years. The Mason & Hamlin Organ and Piano Company deserves mention for the new method of stringing it has introduced. By this system, which was patented in 1883, the strings are secured by metallic fastenings directly to the iron frame, instead of winding them around wrest-pins set in wood as in the old system.

The business of piano-making in this country is continually assuming larger proportions, and new firms continue to spring up. Naturally, a certain percentage of the work produced is cheap and poor. But on the whole the many useful improvements made in the construction of the piano by American manufacturers have served to make their instruments superior in many ways to those produced in Europe. (F. L. W.)

PIATT, JOHN JAMES, poet, was born at Milton, Dearborn co., Ind., March 1, 1835. Taken in boyhood to Columbus, Ohio, he became a printer. In 1856 he removed to Illinois and soon began to contribute poems to the *Louisville Journal*, whose editor, G. D. Prentice, proved a steadfast friend. In 1860 Piatt and W. D. Howells published at Columbus *Poems of Two Friends*. In 1861 Piatt removed to Washington, having been appointed clerk in the U. S. Treasury Department. In 1867 he engaged in newspaper work in Cincinnati, but in 1870 he returned to Washington as clerk in Congress, and two years later was made librarian of the lower House. In 1882 he was appointed U. S. consul at Cork, Ireland. His publications are *Nests at Washington* (1864); *Poems in Sunshine and Firelight* (1866); *Western Windows* (1869); *Landmarks and other Poems* (1871). The later volumes contain old retouched as well as new poems. His uncle, **DONN PIATT**, born in 1829, rose to the rank of colonel in the civil war, and is noted as a journalist.

J. J. Piatt's wife, SARAH MORGAN BRYAN PIATT, born near Lexington, Ky., Aug. 11, 1836, was educated at Henry Female College, Newcastle, Ky., and early wrote poems for the *Louisville Journal*. She was married in 1861, and some of her early poems were published in *Nests at Washington* and others in *A Woman's Poems* (1871). Her poems are thoughtful and deep in sentiment, but sometimes obscure.

PICKENS, ANDREW (1739-1817), general, was born at Paxton, Bucks co., Pa., Sept. 19, 1739. His parents, who were of Huguenot descent, removed to South Carolina in 1752. In 1761 Andrew served in an expedition against the Cherokees, and at the outbreak of the revolution he was made captain of militia. Throughout the struggle he displayed patriotic zeal, and rose to the rank of brigadier-general. In February, 1779, he defeated a band of Tories under Col. Boyd at Kettle Creek; in June he covered the retreat at Stono Ferry, and later in the same year defeated the Cherokees at Tomasee. For his part in the battle of Cowpens, Jan. 17, 1781, see **COWPENS**. He had command of the Carolina volunteers at Eutaw Springs, Sept. 8, 1781. He made an expedition against the Cherokees in 1782, which resulted in the cession of a large territory. He was afterwards member of the State Legislature (1783-94), then member of Congress for a single term, and major-general of militia. He took part in negotiating several treaties with the Indians. In 1765 he married Rebecca Calhoun, aunt of John C. Calhoun. He died in Pendleton District, S. C., Aug. 17, 1817.

His son, **ANDREW PICKENS**, became governor of South Carolina in 1816, and died in 1838. **FRANCIS W. PICKENS** (1807-1869), son of Andrew, was noted as a Secession leader. Educated at South Carolina College, he was a lawyer and first obtained note as a speaker in

the Legislature during the nullification excitement in 1832. He maintained that Congress, being a creature of the States severally, had no sovereign power. In 1835 he was elected to Congress, and there he denied the right of Congress to abolish slavery in the District of Columbia. After ten years' service in the national legislature he was returned to the State Senate, where he opposed a movement for immediate secession. He took part in the Southern Convention at Nashville in 1850 and in the Democratic National Convention at Cincinnati in 1854. He was sent as U. S. minister to Russia in 1858, but returned to take part in the secession of South Carolina, of which State he was then chosen governor. He demanded the surrender of Fort Sumter from Major Anderson, and afterwards aided in every way the rebellion. He retired from office in 1862 and died at Edgefield, S. C., Jan. 25, 1869.

PICKERING, TIMOTHY (1745-1829), statesman, was born at Salem, Mass., July 17, 1745. He graduated at Harvard College in 1763, and became a lawyer at Salem in 1768. He was prominent in resisting the arbitrary measures of Parliament, and in 1774, on behalf of the people of Salem, he delivered an address to Gov. Gage on the occasion of the Boston Port Bill. While holding the office of judge, he published *An Easy Plan of Discipline for a Militia* (1775), which became the textbook of the State. He served in the revolution as colonel, and in 1777 was made adjutant-general by Washington, and in 1780 quartermaster-general. After the war he became a merchant in Philadelphia. In 1786 he removed to Wilkesbarre to organize the county of Luzerne and to settle the disputes which had arisen from conflicting claims of Connecticut and Pennsylvania to the Wyoming Valley. While acting in this capacity he was seized by persons in disguise, imprisoned and harshly treated for twenty days. He was sent as delegate of Luzerne county to the Pennsylvania Constitutional Convention of 1790. In Washington's administration he was postmaster-general (1791-94), then secretary of war (1794-95), and secretary of state (1795-1800). He had also been much employed in negotiating treaties with the Indians of New York and Ohio. Leaving office poor, he lived for a time in a log-house at Wyoming, but afterwards, by the sale of lands, was enabled to return to Salem, Mass., where he was made judge of common pleas. In 1803 he was elected to the U. S. Senate, being an ardent Federalist. During the war of 1812 he was a member of the board of war of Massachusetts. He was afterwards member of Congress for a single term, but retired from public life at the age of 72, though he remained president of the Essex Agricultural Society. He died at Salem, Jan. 29, 1829. His *Life*, left incomplete by his son Octavius, was finished by C. W. Upham (4 vols., 1867-73).

His oldest son, **JOHN PICKERING** (1777-1846), philologist, was born at Salem, Feb. 17, 1777, accompanied his father in his visits to the Six Nations of New York, and was thus led to investigate the Indian languages, to which he devoted much attention throughout life. After graduating at Harvard in 1796 he spent some time in diplomatic service at Lisbon and London, and was afterwards a lawyer at Salem. From 1829 till his death, on May 5, 1846, he was the city solicitor of Boston. His chief publications were on philological subjects, and include, besides treatises on the Indian languages, a *Vocabulary of Americanisms* (1816) and a *Greek and English Lexicon* (1826), which reached a third edition before his death and was long held in high esteem. He was the founder of the American Oriental Society and president of the American Academy of Arts and Sciences.

Another son, **OCTAVIUS PICKERING** (1792-1868), born in Wyoming Valley, Sept. 2, 1792, graduated at Harvard College in 1810, and became a lawyer at Boston. He was State reporter from 1822 to 1840, publishing 24 volumes of *Reports*. He afterwards lived in Europe for some years and died at Boston

Oct. 29, 1868, leaving his father's biography unfinished.

CHARLES PICKERING (1805-1878), naturalist, grandson of Timothy, was born in Susquehanna co., Pa., Nov. 10, 1805. He graduated at Harvard College in 1823 and obtained his medical degree in 1826. After some years' practice at Philadelphia, where he was also active in the Academy of Natural Sciences, he went in 1838 as naturalist on the Wilkes exploring expedition. He also travelled in India and Eastern Africa, examining the different tribes. The result of his researches was given in his *Races of Men and their Geographical Distribution* (1848; vol. ix. of Wilkes' Report); *Geographical Distribution of Animals and Plants* (1854; vol. xix. of Wilkes' Report); and *Geographical Distribution of Plants* (1861). He afterwards lived a very retired, studious life at Boston, where he died March 17, 1878. After his death appeared his *Chronological History of Plants* (1879), a laborious but unsystematic work, cumbered with useless learning.

EDWARD CHARLES PICKERING, physicist, great-grandson of Col. Timothy Pickering, was born at Boston, July 19, 1846. He graduated at the Lawrence Scientific School in 1865, and was chosen professor of physics in the Massachusetts Institute of Technology in 1867. He took part in observing the solar eclipse of 1869 in Iowa and that of 1870 in Spain. He has made extensive researches in optics and in the polarization of light, and has published *Physical Manipulation* (1874).

PICKETT, ALBERT JAMES (1810-1858), historian of Alabama, was born in Anson co., N. C., Aug. 13, 1810. He removed in boyhood to Autauga co., Ala., and became a lawyer. He took part in the Creek war, and became a colonel. His only publication was his *History of Alabama* (2 vols., Charleston, 1851). He died at Montgomery, Ala., Oct. 28, 1858. C. M. Jackson published a brief biography.

PICKETT, GEORGE E. (1825-1875), a Confederate general, was born at Richmond, Va., Jan. 25, 1825. Graduating at West Point in 1846, he served in the Mexican war from Vera Cruz to the capture of Mexico, winning two brevets for gallantry. He was afterwards engaged in frontier duty until June 25, 1861, when he resigned to enter the Confederate service. In the defence of Richmond in 1862 he commanded a brigade, and was severely wounded at Gaines's Mill. Rejoining the Army of Northern Virginia as major-general, he was conspicuous for courage, skill, and zeal. At Gettysburg, July 3, 1863, he led the famous final assault on the Union lines (see GETTYSBURG). Gen. Pickett afterwards commanded in North Carolina, where he captured Plymouth. At the opening of the campaign in 1865 his division was engaged in protecting the Southside Railroad, near Richmond, but was surrounded and overwhelmed at Five Forks, April 1, 1865. Gen. Pickett died at Norfolk, Va., July 30, 1875.

PIERCE, GEORGE FOSTER (1811-1884), bishop of the Methodist Episcopal Church, South, was born in Greene co., Ga., Feb. 3, 1811, being the son of Rev. Dr. Lovick Pierce (1785-1879), a noted pulpit orator. After studying law he joined the Georgia Conference in 1831, and was engaged as an itinerant in Georgia and South Carolina. He was prominent in the General Conference of 1844, when the Methodist Church was divided on the slavery question. In 1848 he was made president of Emory College, and was ever active in promoting its financial interests. In 1854 he was chosen bishop, and found a wider field for his executive abilities. He was also noted as an orator, edited a magazine, and published many sermons. His only book was *Incidents of Western Travel* (1857). He died Sept. 3, 1884.

PIERPONT, JOHN (1785-1866), clergyman and poet, was born at Litchfield, Conn., April 6, 1785, being descended from Rev. James Pierpont, the second

minister of New Haven and a founder of Yale College. Here John graduated in 1804, and then went to South Carolina as a tutor in the family of Col. William Allston. Returning to the North he became a lawyer in 1812, but soon engaged in unsuccessful mercantile enterprises with John Neal (q. v.) at Boston and Baltimore. In 1819 he was ordained minister of Hollis Street Unitarian Church, whence he passed to Troy, N. Y., in 1845, and thence to Medford, Mass., in 1849. He was an earnest anti-slavery and temperance orator, and obtained public favor by his poetic addresses. The most noted of these was *The Airs of Palestine* (1816), which set forth the associations of music with natural scenery and national character. At the centennial celebration of his native place he gave a humorous sketch of Yankee character. In 1861, true to the anti-slavery zeal of younger days, he accepted the chaplaincy of a Massachusetts regiment, but was soon transferred to a clerkship in the U. S. Treasury, from which he retired in 1864. He died at Medford, Mass., Aug. 27, 1866. A collection of his *Poems* appeared in 1854, and he also published some school-books.

PIERREPONT, EDWARDS, lawyer, was born at North Haven, Conn., March 4, 1817. Graduating at Yale College in 1837, he was admitted to the bar in 1840, and practised for some years at Columbus, Ohio, but removed to New York city in 1846. He was elected judge of the superior court of New York in 1857, but resigned in 1860 and resumed practice at the bar. In 1862 he was appointed, with Maj.-Gen. John A. Dix, to try the prisoners of state held on various charges growing out of the Rebellion. In 1867 he served in the New York State Constitutional Convention, especially on the Judiciary committee. He also conducted for the U. S. government the prosecution of John H. Surratt for complicity in the assassination of Lincoln. In 1869 Pres. Grant appointed him U. S. attorney for the southern district of New York, which office he resigned in May following. In 1875 he was called into Pres. Grant's cabinet as attorney-general of the United States, and in May, 1876, was sent as minister to England. He resigned this office in December, 1877. He published *From Fifth Avenue to Alaska* (1884).

PIG. See SWINE.

PIGEON. See FOWL.

PIGMENTS. The mining and manufacture of pigments in the United States have been of steady growth, and although there was for many years a strong prejudice in favor of imported pigments, this has given way to a fair appreciation of the home products, until now both the imported and domestic are sold on their merits, and as nearly all of domestic productions compare favorably with the imported, the former are consumed in yearly increasing quantities; our imports show little variation from year to year on most pigments, while a few show a decrease. In considering articles properly classed under the name "pigments," only such are treated as are manufactured or produced in the United States in commercial quantities.

Barytes.—The heavy spar from which this article is made is found in many sections of the country, but the principal sources of supply are Missouri, Virginia, North Carolina, and Tennessee. As its principal use is as a substitute or adulterant in the manufacture of paints, both dealers and manufacturers withhold all information as to the amount of production and use. The total amount produced, however, may be estimated as approximating 50,000 tons annually. Its principal use is in the adulteration of white lead and in the manufacture of mixed paints, and as a weighting material for various purposes. Owing to its great weight and its dazzling whiteness, it is regarded as the best adulterant of white lead, and on that account not liable to detection. It is also largely employed as a weighting substance by paper-makers and others. Barytes is also imported from Germany, England, and

Canada. Artificial barytes, commercially known as "blanc fixé," is a mixture of crude heavy spar and other materials, and is superior to natural barytes as a pigment, having greater covering capacity. It is largely employed by paper and card manufacturers. The amount imported is about equal to that made here. There is no difference in the quality, although the imported realizes a higher price.

Litharge.—See article WHITE LEAD.

Ochre.—In commerce only the lighter shades of hydrated peroxides of iron are known as ochres; the darker shades, notably the browns and reds, are designated as "metallic paints." Ochres are found in many States, but the best are found in Virginia, Pennsylvania, Missouri, Georgia, and South Carolina. Some of these deposits contain various colors and shadings, but not all are valuable as pigments. The more common grades are used by floor-cloth manufacturers in the preparation of the body of the cloth. Of the grades used as a pigment about 10,000 tons are annually mined and sold. Ochres are imported from France, and these are preferred by manufacturers of paints as they require less oil for grinding, and are consequently more economical in the manufacture of "mixed paints."

Red Lead.—See article WHITE LEAD.

Sienna.—There are many deposits of this clay in the United States, but most of them are of inferior quality. The mines are in Pennsylvania, New Jersey, Maine, and Virginia, the quality of product ranging in this order. Painters prefer the imported, and although double the price of the domestic, Sicily sienna is imported in yearly increasing quantities.

Terra Alba.—The gypsum used to produce this article is imported from Nova Scotia, but what proportion of the total quantity is used in the manufacture of paints is not known. The terra alba made from gypsum mined in the United States is used as an adulterant for many articles, as also by paper-makers and others as a weighting substance. Fine grades of terra alba are imported from France and England, though only in limited quantities.

Ultramarine.—In commerce, the artificial product has received this name and the pigment product of lapis lazuli is scarcely known except to the artist, while its high cost excludes it from most studios. Only three firms are engaged in the manufacture of ultramarine, two factories being located in the State of New Jersey and one in New York. The annual production of these works amounts to about 2000 tons. For some years after the manufacture of this pigment was established in the United States, there existed a strong prejudice against it, and fully double the price asked for the domestic product was obtained for that imported from Germany. It was not until the year 1880 that the first manufacturer began to realize a fair reward for his perseverance in introducing American ultramarine, which from the beginning was equal to the best imported.

Umber.—The only States from which umber is obtained are Pennsylvania and Vermont, the former supplying fully five-sixths of the total of about 1500 tons annually marketed. In all respects except color the American umber is the equal of that imported from Turkey, while the price is much lower. The imported is of a rich, reddish-brown, while the American inclines to gray. An artificial umber, made by mixing certain mineral pigments, and which in color is a good imitation of Turkey umber, is sold as the genuine imported.

Vermilion.—The manufacture of this pigment in the United States is controlled by a combination of manufacturers which regulates the price, the amount of production, and the trade in the article. The process of manufacture being one of extreme difficulty and requiring great skill, the process is kept secret and the manufacturers, not over six in number, are enabled to prevent competition, having successfully checked at-

tempts to establish new plants which have at different times been in contemplation. The manufacture of this artificial sulphide of mercury is made a specialty of manufacturers of other pigments and paints, the amount consumed being too small to make its manufacture profitable as a separate industry. The amount manufactured varies from year to year, averaging about 800,000 pounds, but does not show the increase which is noticeable in the consumption of most other pigments. This is due to the introduction of substitutes known as vermilion, but not made from quicksilver. The genuine quicksilver vermilion is commercially known as "quicksilver," "English," or "California" vermilion. The imports of English vermilion do not increase, the American product being equal to the imported in every respect, and by many regarded as superior. A number of pigments are on the market, known as vermilion but not made from quicksilver, and these have a large sale, owing to their low market price. The principal of these, "American vermilion," "Persian red," "Persian scarlet," "scarlet vermilion," etc., are chromates of lead. Of these fully 1,000,000 pounds are produced and sold annually. Other cheap substitutes are aniline colors which, instead of growing darker on exposure as is the case with quicksilver vermilion, grow lighter. As their color is brilliant they have become popular and their sale has steadily increased until at the present time their consumption equals that of the genuine. These aniline imitation vermilions are sold under various names, the better known being "Roman red," "Swiss red," "Columbian red," "rubeide," etc. The relative value of these several vermilion pigments is not easily stated, but true quicksilver vermilion is superior in body, richness, and permanency. The chromates of lead lack body, are not so rich in color, but have the compensating quality of greater permanency and extreme cheapness. The aniline vermilions have good body, are even more brilliant than the quicksilver vermilion, but their grave fault is the fugaciousness of the color.

White Lead is treated in a special article, which see.

Whiting and Paris White.—The manufacture of whiting is confined to the cities of New York, Brooklyn, Philadelphia, and Boston. The material used, chalk, is all imported from Hull, England, whence it is brought as ballast in sailing vessels. The annual production is from 300,000 to 350,000 barrels. Paris white is made from English cliffstone, a variety of limestone, which is imported from England. From 4000 to 4500 tons are annually used. About 300 tons of Paris white are imported from England.

Zinc White.—The oxide of zinc, known as zinc white, ranks second in importance as a pigment. It is extensively employed in the manufacture of mixed paints, and is especially esteemed for indoor painting, owing to the purity and brilliancy of the color. It is made directly from the zinc ore by several firms in New Jersey, Pennsylvania, Missouri, and Wisconsin. The consumption has increased steadily and has now reached about 25,000 tons, only about 2000 tons being imported. The French zinc white is regarded as superior to the American in purity of color, and the German is preferred by others for no well-defined reason. Fully 20,000 tons are annually used as a pigment, while 5000 tons are consumed by manufacturers of paper, rubber, and pottery. New York city is the principal market.

(H. G. A.)

PIKE, the strongest and most voracious of fresh water carnivorous fish, comprising the genus *Esox*, the only genus of the family *Esoxidae*. The pikes are well represented in the waters of the United States.

there being five or six species, while only one species is found in Europe and Asia. The *Esoxidae* are soft-rayed abdominal fishes, with long bodies, having but one dorsal fin, opposite the anal. The mouth is large, with a wide gape, and is plentifully supplied with teeth.

The skeleton, especially the skull, is remarkably soft, and Agassiz assigns them to a low place among abdominal fishes. The body is covered with scales, barbels are wanting, the margin of the upper jaw is covered by the intermaxillaries medially and by the maxillaries laterally, the stomach is without blind sac, the air bladder simple, and the gills open very wide.

Of the American pikes the largest is *Esox Estor*, the Muskallonge or Maskinonge (Canadian-French *Musque-allongé*, long face or snout). This species is found only in the Great Lakes and the waters of the St. Lawrence basin. It grows to the length of 3 feet, and is said to occur in Lake Champlain of over 4 feet in length and of 40 lbs. weight. This fish is of a deep greenish-brown hue on the back, while the sides have numerous rounded pale yellow spots, and the abdomen is white, the fins being of a reddish-yellow color with dark green marbling. The snout is very long and acute, the borders of the upper jaw being formed of the maxillaries alone, their edges furnished with several rows of long, powerful, and very sharp, awl-shaped teeth. The lower jaw is considerably longer than the upper, and is armed for less than half its length with powerful, recurved teeth, the two largest in front. The head and body are flattened above and much compressed at the sides, the dorsal fins directly above the anal, the caudal powerful and deeply forked.

This is the boldest, fiercest, and most voracious of all fresh-water fishes, making havoc among all other tenants of the waters it inhabits, none, perhaps, except the great lake trout, being able to resist its attacks. Even the spring dorsal fins of the perch are said to not afford protection from the pike. It bites daringly at dead bait, and is said to be easily taken even by a bait of tin or red cloth made to play briskly through the water. The European pike, *E. lucius*, is closely related in specific character to *E. estor*. It attains 3 feet in extreme length, is found in most of the rivers and lakes of Europe, and is much angled for, the flesh being well esteemed for table use.

The smaller species of American pike are commonly known as pickerel. There are several of these, the largest being *E. lucioides*, a fish which, like *E. estor*, is peculiar to the basin of the St. Lawrence. It is from one to two feet in length and rarely exceeds 16 or 17 lbs. weight, and is a handsome fish, with a four-sided body, longer and sligher in proportion to its depth than in the Muskallonge. The snout is not nearly so long and much more obtuse than in the latter, the under jaw being less elongated, and armed with a single row of small teeth round the fore part, with large, awl-shaped teeth on the sides. The back is of a rich blackish-green color, the sides greenish-gray, the abdomen pearly white, there being several rows of diamond-shaped yellowish spots along the body and head. A bright speck on the tip of each scale gives a sparkling aspect to this fish. It is equal in boldness and voracity to the Muskallonge, attacks fish of every variety, even of its own species, and preys also on the young of wild fowls, rats, reptiles, or any small creature that ventures into its domain. It is generally taken with a hook baited with white flesh or other substance and moved rapidly over the surface. It is also readily caught in winter by spearing through holes in the ice. It formed an essential food-supply to the Indian hunters when short of other food in winter.

The common pickerel (*E. reticularis*) is perhaps the commonest of all game fishes in the north-eastern United States. It ranges from New England to Western Pennsylvania, and south perhaps to the hill-districts of Virginia. In size it is much below those above mentioned, being of an average weight of 2½ or 3 lbs. It has the elongated snout and curved lower jaw of the Muskallonge, and is in color olive-green on the back and greenish-yellow on the sides. It is more voracious if possible than the others, bites at any time of the day, and with the bait above or below water, drawn fast or slow. It darts on its prey with great force, its prominent

lower jaw serving as a defence against violent blows on the bottom of streams. The Long Island pike, *E. fasciatus*, is the smallest of the family, and of little value to sportsmen. It is remarkable for the great size of its scales as compared with the other species, whose scales are very minute. The name of pike is given to several sea-fish of the allied genus *Belone*, the European sea-pike, *B. vulgaris*, being known also as the mackerel guide, as it precedes the latter in their annual migration to their spawning-grounds. (C. M.)

PIKE, ALBERT, poet and general, was born at Boston, Dec. 29, 1809. When he was a child his family removed to Newburyport, and he began to teach after studying for a time at Harvard College. In 1831 he went to St. Louis, travelling mostly on foot, and then joined an expedition to Santa Fé. After further wanderings he settled in Arkansas, becoming editor, and in 1834 proprietor of a newspaper at Little Rock. He published (Boston, 1834) a narrative of his adventures and added to it several poems, suggested by the scenery through which he had passed. He became a lawyer in 1836, supervised the publication of the statutes of Arkansas, and published *Reports of the Supreme Court of that State* (1840-45). In the Mexican war he served as a volunteer, and at the outbreak of the civil war he recruited on behalf of the Southern Confederacy a force of Cherokee Indians, whom he led at the battle of Pea Ridge, March 7, 1862. On account of their scalping some of the fallen, the Confederate government caused the disbandment of this Indian force. After the war Gen. Pike edited the *Memphis Appeal* and in 1868 he removed to Washington. He has received the highest degrees in free-masonry, and has published the *Statutes and Laws of the Ancient Scottish Rite* (1859). His most noted poems are the *Hymns to the Gods*, composed before he left New England, published at Boston in 1831, reprinted in *Blackwood's Magazine* in 1839, and in his *Nugæ* (Phila., 1854, and later).

PIKE, ZEBULON MONTGOMERY (1779-1813), general, was born at Lambertton (now part of Trenton), N. J., Jan. 5, 1779. His father, Zebulon Pike (1751-1834), had been a captain in the Revolutionary army and afterwards in the regular army. The son was appointed cadet in his father's regiment in 1799, and soon promoted lieutenant. His mathematical skill led to his being appointed in 1805 to make a survey of the Upper Mississippi, which was accomplished in less than nine months. Being then made captain he was employed in exploring the newly acquired territory of Louisiana, and while thus engaged was arrested for invading Spanish ground, and carried to Santa Fé, where his papers were seized and examined. He was escorted across Texas and arrived at Natchitoches, July 1, 1807. The narrative of both expeditions is given in his book, *The Sources of the Mississippi and its Tributaries* (Phila., 1810), for which he received the thanks of the government. He was promoted colonel in 1812 and brigadier-general in March, 1813, when he was selected to command the expedition against York (now Toronto), the capital of Upper Canada. He sailed from Sackett's Harbor, landed under heavy fire, April 27, 1813, carried one battery by assault, and was moving on the main works when he was killed by the explosion of the magazine. Pike's Peak in Colorado preserves his name and fame. His *Life* was written by Gen. H. Whiting in Sparks's *American Biography*.

PILLOW, GIDEON JOHNSON (1806-1878), general and politician, was born in Williamson co., Tenn., June 8, 1806, being a grandson of John Pillow, a Revolutionary soldier, who had settled at Nashville in 1783. He graduated at the university of that city in 1827 and entered on the practice of law at Columbia, Tenn., in 1830. He assisted in the nomination and election of President Polk, by whom in July, 1846, he was commissioned brigadier-general. His brigade of Tennessee volunteers joined Gen. Scott's army at Vera Cruz, and took part in its capture. Pillow commanded

a division of the army in the march to Mexico, and was wounded at Cerro Gordo and Chapultepec. After entering the city of Mexico he had serious difficulties with Gen. Scott and was placed under arrest, but was released by orders from Washington. Returning to Tennessee he devoted himself to the management of his estate. In 1850 he was a member of the Nashville Southern Convention and opposed secession. In April, 1861, he undertook to raise troops in Tennessee for the Confederacy and was made major-general in the Confederate army. His conduct at FORT DONELSON is narrated under that head. Gen. Grant in his *Personal Memoirs* expresses a poor opinion of his worth as soldier and general. Pillow escaped to Nashville, and afterwards had some nominal command under Beauregard. He died in Lee Co., Ark., Oct. 6, 1878.

PILOTY, KARL VON (1826-1886), a German painter, was born at Munich, Oct. 1, 1826. He studied at the Munich academy and became manager of the lithographic institute founded by his father. He improved his knowledge of art by travels through Belgium, France, and England. His first painting, *The Dying Mother and the Nurse*, attracted attention to his merits. His next was *The Adhesion of the Elector Maximilian to the Catholic League*. After Piloty was made professor in 1858, he was quickly surrounded by a crowd of enthusiastic students, some of whom, Makart for instance, have since been acknowledged masters. On the death of Kaulbach, the direction of the Academy was assigned to Piloty. Among his noted works are *The Assassination of Wallenstein*; *Nero amid the Ruins of Rome* (1864); *Columbus Discovering America* (1865); *The Death of Julius Caesar*; *Mary Queen of Scots listening to her Death Warrant*; *Thusnelda in the Triumph of Germanicus* (1872). At various international exhibitions he obtained the highest honors. He died July 21, 1886.

PINCKNEY, CHARLES (1758-1824), statesman, was born at Charleston, S. C., in 1758, being grandson of William Pinckney (1703-1766), commissary-general of South Carolina. He became a lawyer and on the capture of Charleston in 1780 was sent as prisoner to St. Augustine. He was afterwards elected to the State Legislature, to Congress, and to the Convention which framed the United States Constitution in 1787. In the next year he presided over the Convention which framed the State constitution and was governor of the State for several years. In 1798 he was chosen to the U. S. Senate, in which he advocated the principles of Jefferson. In 1802 he was sent as minister to Spain and there obtained a relinquishment of Spanish claims to Louisiana. Returning in 1805 he served chiefly in the State Legislature, but in Congress, 1819-21, he opposed the Missouri Compromise. He died at Charleston, Oct. 29, 1824.

His son, **HENRY LAURENS PINCKNEY** (1794-1863), was long a member of the South Carolina Legislature, member of Congress from 1833 to 1837, afterwards mayor of Charleston and collector of the port. He upheld the extreme States rights view. He published a biography of his brother-in-law, Robert Y. Hayne, and of Jonathan Maxey and Andrew Jackson.

PINCKNEY, CHARLES COTESWORTH (1746-1825), was the most distinguished member of a family noted in South Carolina history. Thomas Pinckney, its founder, emigrated from Lincolnshire, England, in 1687. Charles C. Pinckney was born at Charleston, Feb. 25, 1746. His father, who was chief-justice of the colony, took his family to England in 1753 to be educated. Charles graduated at Christ Church College, Oxford, studied law at the Middle Temple and attended the Royal Military Academy in France. After his return to Charleston, in 1769, he was a lawyer, and took part in the political agitation of the time. He was elected to the Provincial Congress, and at the outbreak of the war was made colonel. He assisted in the defence of Charleston in 1775, and afterwards went

North where he fought at Brandywine and Germantown. Returning to the South he had a share in the vicissitudes of the struggle for independence, and after the surrender of Charleston was prisoner, though part of the time on parole, until February, 1782. He was a delegate to the Convention which framed the U. S. Constitution, to the State Convention which ratified it, and to the State Constitutional Convention of 1790. He declined a seat in the U. S. Supreme Court and a position in Washington's cabinet. He was sent as U. S. Minister to France in 1796, but the Directory, offended at the attitude of America, dismissed him and threatened war. The government re-appointed him, but in a spirit of conciliation joined with him John Marshall and Elbridge Gerry. After various delays they were told by Talleyrand that no peace could be made until the members of the Directory had been paid. The insulting proposal was rejected, and according to a popular story, Pinckney exclaimed, "War be it, then! Millions for defence, but not a cent for tribute!" On the envoys' return to America this exclamation became a favorite motto. Pinckney was elected to Congress, and in 1800 he was supported by the Federalists for the vice-presidency, but was defeated. He had even less success in 1804, when he was a candidate for the presidency, and received only 14 out of 176 electoral votes.

His brother, **THOMAS PINCKNEY** (1750-1828), was also educated in England, and became a lawyer. In the Revolutionary war he rose to the rank of major, fought at Stono Ferry, and was wounded and captured at the battle of Camden, where he was serving as aide to Gen. Gates. He was sent as U. S. Minister to England in 1792, and in 1794 negotiated a treaty with Spain, securing to American citizens the free navigation of the Mississippi. Returning home in 1796 he was twice elected to Congress as a Federalist, and on the triumph of the opposite party retired to private life. In 1812 Pres. Madison appointed him major-general, and he took part in campaigns against the Creeks, whom he defeated at Horse-shoe Bend. He died at Charleston, Nov. 2, 1828.

PINE. This well-known class of trees has been already treated under *CONIFERÆ*, *FORESTRY*, and *LUMBER*, and little remains to be said concerning it. It may be stated generally that the pines are distinguished from all the other *Conifera* by the character of their foliage, which consists of needle-shaped leaves in clusters of 2, 3, or 5, surrounded by a sheath at the base. They embrace the pitch pines and their relatives, with leaves 2 or 3 in cluster, scaly-sheathed at base; wood resinous; cones lateral and persistent long after shedding the seeds, scales thickened at the ends, and often tipped with spines; leaves rigid; and the white pines, with softer leaves, 5 in cluster, the sheath early deciduous; cones long, cylindrical, terminal, and falling after the seeds are shed; scales little or not at all thickened at point; seeds thin-shelled and winged.

In the genus *Pinus* the flowers are monœcious, the fertile catkins terminal, solitary or aggregated, the sterile catkins clustered at the base of the shoot of the season. Each stamen answers to a flower, which is reduced to a two-celled anther with hardly any filament. The fruit is a woody cone, usually large, whose nut-like seeds are partly sunk in excavations at the base of the scales, there being two to each scale. There are from 3 to 12 cotyledons. The blossoms develop in late spring and the cones mature in the autumn of the second year.

The pines are confined to Europe, Asia, and America, except one species in the Canary Islands, and are found mostly in the temperate and cooler regions, where they form large forests. They are among the most useful of trees, yielding, besides wood, such important products as turpentine, rosin, tar, pitch, etc., while several species bear large and edible nuts. They

are well represented in the United States, whose white pine (*P. strobus*) is the most valuable commercially of all the pines, and yields most of the timber used in and exported from that country. In the northern and eastern regions of the United States this species formerly covered enormous tracts of land, but its range has been greatly reduced by the destructive axe of the woodman. In form the white pine is the most elegant of all the usually grown species, and it is much used for ornamental purposes. It is distinguished by its gray bark, which is smooth and shining up to 15 years of age, but afterwards cracks and roughens, the graceful

White Pine.

lightness of its branches, and its general gracefulness of form. It grows straight and rapidly, sometimes attaining a height of 200 feet. The wood is soft, fine-grained, and very durable, while the stem is so straight and even that large trunks are much sought for as masts of ships.

The United States have several other species of the 5-leaved, or white pine group. In the Pacific region is *P. Lambertiana*, or the great sugar pine of California and Oregon, one of the huge trees of the West, isolated specimens of which sometimes reach a height of 300 feet, and 20 feet diameter of trunk. It bears large, bright-green leaves, and cones of enormous size. Other western species of this group are *P. aristata*, the awn-coned pine; *P. flexilis*; and *P. monticola*, the mountain pine, whose wood resembles that of *P. strobus*.

Of pines with 3 leaves in the cluster, the Atlantic United States possess *P. australis*, the long-leaved or southern yellow pine, a lofty tree with very resinous wood and durable timber, much used in the South; *P. taeda*; *P. rigida*, the Northern pitch pine; and *P. serotina*, the pond pine. In the Pacific region there are of this group *P. macrocarpa*, the great hooked pine; *P. Sabiana*, Sabine's pine, which, like the above, bears large edible seeds; *P. ponderosa*, the most abundant pine of California and Oregon; *P. edulis*, the New Mexican nut pine, with large, edible seeds; *P. Coulteri*, a Californian species, with very large seeds, and leaves thicker and heavier than in any other species; and *P. insignis*, so named from its bright grass-green color.

Of pines with two leaves in the cluster may be named *P. pungens*, the Table Mountain, or prickly-

pine of the Southern Alleghenies; *P. mitis*, the yellow pine of the North, a valuable timber-tree; *P. inops*, the Jersey, or scrub-pine, a very resinous species; *P. banksiana*, the Northern scrub-pine; and *P. resinosa*, the resinous, or red pine of the North, which is next to the white pine in commercial value. There are other American species, several of which have been introduced from Europe as ornamental trees. Principal among the latter are *P. excelsa*, the Bhotan pine from the Himalayas; *P. cembra*, from the Alps; *P. sylvestris*, the Scotch pine, and *P. austriaca*, the Austrian pine. American pines have also been taken to Europe as ornamental trees, a purpose to which this genus of trees is excellently adapted through its graceful forms and evergreen foliage. For the same reason much has been done to disseminate the more attractive species over the earth.

The pines of the Southern Atlantic States are of special value in their abundant yield of rosin and oil of turpentine, tar, and pitch. This is mainly gathered from one species, *P. australis*, though *P. taeda*, the loblolly-pine, yields also a considerable quantity of turpentine. *P. australis*, the Southern yellow, or long-leaved pine, is a tree from 60 to 70 feet high and 15 to 20 inches diameter. Its leaves are bright green, and from 10 to 15 inches long, enclosed at base in long white sheathes. The hardness and compactness of its timber render it of great value for floors, or stairways where the wear is great, while it yields the great sum of the tar, rosin, and turpentine of the United States. The range of States from North Carolina to Florida possesses about 60,000 square miles of pine-forest, and their present yield of the above-named products is susceptible of great increase. The value of the naval stores (pitch, rosin, turpentine, etc.) produced in North Carolina in 1880 was about \$8,000,000, while South Carolina also yielded largely. This product is steadily on the increase, and promises to become of great value in the future. The crude turpentine is obtained by tapping the trees and collecting their exudations. From 10 to 25 per cent. of this is oil of turpentine, which is obtained by distillation, while the residuum constitutes the rosin. Tar is obtained by burning the dead limbs and wood in kilns, while the reduction of the tar to half its volume by evaporation yields pitch.

(C. M.)

PINEAPPLE, the fruit of *Ananassa sativa*, a tropical plant which is indigenous to South America and some of the West India islands, though now so perfectly naturalized in many tropical countries as to seem a native species. It is found in almost a wild state in India and Ceylon, and is abundant in the Malayan Peninsula, China, the islands of the Eastern

Pineapple.

Archipelago, and in parts of Africa. The fruit receives its name from its resemblance in form and external appearance to the cones of some species of pines

The plant is a member of the *Bromeliaceae*, a small endogenous family, nearly related to the ginger and banana families, its plants generally stemless, and mostly epiphytes in the forests of tropical America. The *Tillandsia*, or "long moss," of the Southern States, is a member of the family.

The pineapple plant is a biennial, with the habits of the aloe, but much thinner leaves, which form a crown of foliage, each leaf being recurved at the point and having small sharp spines on its edges. From the centre of the cluster of foliage rises a stem two or three feet high, bearing on its apex a conical spike of flowers, each flower in the axil of a bract. The upper flowerless bracts develop into a cluster of small leaves. The flowers have three outer or calyx divisions and three inner much longer petalous divisions, six stamens, and three styles. The pineapple is not a fruit botanically considered, but an aggregation of accessory parts, to which the fruit proper (the ripened ovary) bears but a small proportion. Seeds are rarely produced by the cultivated plant, but the whole cluster of flowers undergoes a remarkable change, all parts—stem, ovaries, bracts, etc.—becoming enormously enlarged, and when quite ripe fleshy and succulent, with a sweet and highly flavored juice. On the outer tessellated surface the tips of the bracts and the points of the petals show themselves.

There are many varieties of the pineapple, and when properly cultivated it is one of the best of fruits, but is too often tough, coarse, and indigestible. The first specimens seen in England were sent there as a present to Cromwell, and the plant was first cultivated there about 1715. It had been grown in Holland in the previous century. These glass-raised English pineapples are much superior in flavor to the ordinary commercial fruit, and still find a market, though sold from three to six shillings a pound, while the imported ones can be had for a much lower price. The fruit imported to American ports is better than that sent to England, on account of the shortness of the voyage, yet even here the glass-raised fruit is the best. The Bahamas have long been the source of much of the imported fruit, it being extensively grown there. At Nassau, New Providence, large quantities are canned for exportation. The culture of the fruit for exportation, which was at first restricted to the Bahamas, has extended to Jamaica, Trinidad, the Azores, and other islands, and the trade in it has become extensive and important. In addition to the fruit imported fresh and canned, the juice is expressed and sealed in bottles, for use in flavoring ices and as a syrup for soda-water. It will keep its flavor for a year. The leaves of this and allied species yield a long, fine, and very strong fibre, which is used in Manila for weaving the beautiful Pina muslin, said to be the finest web in the world. It is exceedingly light, delicate, and durable, and is chiefly employed for ladies' handkerchiefs and dresses. Only small quantities of it are exported. (C. M.)

PINKNEY, WILLIAM (1764–1822), statesman, was born at Annapolis, Md., March 17, 1764. His father, a native of England and related to the Pinckneys of South Carolina, opposed the movement for American independence. The son studied law with Judge Samuel Chase and was admitted to the bar in 1786. He was a member of the State Convention which ratified the Federal Constitution in 1788, and he was elected to Congress in 1790, but did not take his seat, though he defended the legality of his election, which was questioned on the ground that he did not reside in the district whence he was chosen. By his eloquence and learning he rose to the head of the Maryland bar, and was prominent in State legislation. In 1796 he was sent to London as one of the commissioners under Jay's treaty, and during his eight years' stay recovered for Maryland from the Bank of England a claim of \$300,000. In 1806 Pres. Jefferson appointed him U. S. Minister to England, and after his return in 1811 Madison made him U. S. Attorney-General. In

the British attack on Washington Pinkney was wounded at Bladensburg, while commanding a battalion of volunteers. After the war he served one term in Congress and then went to Naples as special envoy and thence to Russia as minister resident. Returning in 1818 he was U. S. Senator from 1820 until his death at Annapolis, Feb. 25, 1822. His *Life* has been written by H. Wheaton (1825) and by his nephew, Bishop Pinkney (1853).

PINS. The original pin was undoubtedly a thorn, which was used to fasten together the rude clothing of our remote ancestors. Afterwards a considerable variety of materials came into use for this purpose.

In early England wooden skewers were used, while clasps and ribbons also did the duty of pins. The metal pin was introduced from France in 1543, the manufacture in England beginning in 1626. At Birmingham, which has long been the centre of the English pin manufacture, the industry began about the middle of the last century. Pins were long made there by hand labor, it being given as a remarkable evidence of the division of labor that it took 14 persons to make a pin. Now it takes but 2 or 3 to perform the same work, while the making of a needle, a much more complex process, requires about 70 persons.

Pin-making machines are American inventions of which many have been made during the present century. The first of these of importance was devised by Mr. Wright, a native of New Hampshire, who took out a patent in England in 1824. This machine was adapted to produce a complete pin at every revolution of a wheel. It at first worked imperfectly, and was rendered available only by long-continued experiment and at great expense. Its method of operation in its perfected state is briefly as follows: A pin is a piece of polished brass wire, with point and head, and covered with a coating of tin. In Wright's machine the wire is drawn from a wheel by pincers, which push forward the proper length for a pin at each rotation of the shaft. This is cut off by a die and carried forward to the pointing apparatus, where it is held while a revolving bevel-edge file-wheel roughly points it. It is then carried to a finer file-wheel which finishes the pointing. A third carrier takes the pin to the first heading die, where a steel punch thickens up the wire for the head, while a fourth carrier takes it to a second die, where the head is finished. The complication of this process is now reduced by one machine being used for pointing and another for heading. It only remains to whiten and stick the pins. The former is done in a copper vessel, where the pins are boiled in water containing tin. Several very efficient machines are in use for sticking the pins in paper.

The manufacture of pins in America was begun in 1810 by some English pin-makers. It was abandoned after the war, but practised for a short time again about 1820. A patent for the manufacture of pins at one process was taken out in 1816, but the machine proved too intricate. Somewhat later a small machine is said to have been in operation which made 30 solid-headed pins per minute. In 1832 a machine was invented by John J. Howe which produced from 40 to 50 pins per minute. In this machine the head was not solid, but was made from a coil of fine wire which was wrapped round the pin wire and pressed fast by dies. These "spun-head" pins had the defect that the head often came loose, and the Howe machine was soon adapted to make solid-headed pins which were first made in 1838, and soon superseded the spun-head pins. There have been other inventions, but those named are the most important. Pins are now made with astonishing rapidity, and fastened in papers by machines which seem almost magical in their operation. In one process the pins as made by the machine are placed in a feeding dish, from which they fall to a trough with a slit just wide enough to let the shank

through. The pins, thus suspended in rows by their heads, are carried to a sliding frame with a dozen grooves, in each of which a pin is deposited as it passes under the slit. A dozen are thus arranged in a row with their points all in one direction. The sheet of paper to receive the pins is passed through a grooving machine, which creases it into cross ridges, through which a row of a dozen pins is driven at every thrust forward of the carrying frame. This process can be repeated with great rapidity and the pins stuck as fast as made.

The statistics of the American pin and needle manufacture in 1880 were as follows, as given in the census reports: Establishments, 40; capital invested, \$1,144,550; hands employed, 1077; wages paid, \$392,214; value of materials, \$591,013; value of products, \$1,378,023. The making of pins and needles is, in great measure, confined to Connecticut, which State claims \$804,985 of the total annual product. (C. M.)

PINTO, SERPA. See **SERPA PINTO**.

PIPE LINES. See **PETROLEUM PIPE-LINES**.

PIQUA, a city of Miami co., Ohio, is on the W. bank of the Miami river, 28 miles N. of Dayton, on the Cincinnati, St. Louis, and Pacific and the Cincinnati, Hamilton, and Dayton Railroads. It has an opera-house, 3 hotels, 2 national banks, 2 daily and 4 weekly newspapers, 13 churches, and 5 schools. It has two foundries, oil-refineries, and manufactures of mattresses, straw boards, furniture, flour and meal. The city is regularly laid out with wide streets, lighted with gas and electricity. The site is a level plateau. Two bridges connect it with the opposite side of the river.

PISCICULTURE. See **FISH CULTURE**.

PISTOL. See **SMALL-ARMS**.

PITMAN, ISAAC, the inventor of phonography, was born at Trowbridge, England, Jan. 4, 1813. He was educated at a normal school in London and became a teacher at Barton-on-Humber in 1832, and afterwards at Wotton-under-Edge. Having published a book on shorthand, he removed to Bath in 1839 and devoted himself to the propagation of his system. He established a special printing-office called the Phonetic Institute, and issued a weekly paper. From time to time he revised his system, though its principles remained the same. See **SHORTHAND**, in **ENCYCLOPÆDIA BRITANNICA**.

His brother, **BENN PITMAN**, removed to the United States, and, settling at Cincinnati, carried on similar work. He was also engaged in reporting important trials.

PITRA, JEAN BAPTISTE, French cardinal, was born near Autun, Aug. 31, 1812. He became a priest and taught rhetoric in the seminary of his native town. Afterwards he entered the Benedictine order and resided in the abbey of Solesmes. In 1858 Pope Pius IX. sent him to Russia to study the Oriental canons and liturgy, and in 1869 made him librarian of the Vatican. In 1863 Pitra was made cardinal and in 1879 promoted to the rank of cardinal-bishop of Frascati. In 1884 he was transferred to the see of Porto et Santa Rufina. He has published some biographies and a valuable collection of documents, called *Spicilegium Soleanense* (5 vols., 1852-60), which sheds much light on ecclesiastical history; *Juris ecclesiastici Græcorum historia et monumenta* (1864); *Hymnographie de l'Eglise grecque* (1867); and *Triodion Katanacticon* (1879), which is a continuation of his work on the Greek churches. The *Spicilegium* has also been continued in a second series called *Analecta Sacra* and a third called *Analecta Novissima*.

PITTSBURG, the second largest city of Pennsylvania, is at the confluence of the Allegheny and Monongahela Rivers, which here form the Ohio. It is 353 miles west of Philadelphia by the Pennsylvania Railroad. Altogether, twelve railroads, six of which are trunk-lines, enter Pittsburg and contribute to its prosperity. The commerce, which was formerly

conducted on the Ohio River, has now been mostly transferred to the railroads, yet in 1887 there were 152 vessels belonging to this port, with a tonnage of 33,240. They were chiefly engaged in coal-carrying, the total capital invested being \$8,000,000. Pittsburg is subdivided into three districts, the Old City, East End, and South Side, formerly Birmingham. The Health Bureau estimated its population in 1888 at 237,000, while Allegheny has a population of 96,000. The latter is enclosed between the Ohio and Allegheny Rivers and is a favorite place of residence. The total population of Allegheny county in 1880 was 355,869, and is now estimated at 530,000. The appearance of the city has greatly improved since the introduction of natural gas in 1884 has removed the smoky pall which formerly hung over them. The **ENCYCLOPÆDIA BRITANNICA** gives an excellent account of the history, buildings, and industries of Pittsburg, yet the following particulars may be added. The finest public building is the new county court-house, built of granite and iron, 208 by 306 ft., and enclosing a court-yard. It is 3 stories high and has a tower 425 ft. high. It replaces one that was destroyed by fire in May, 1882. It was completed and furnished at less than the estimated cost, \$2,500,000, and was dedicated with special ceremonies on Sept. 24, 1888, when the centennial anniversary of Allegheny county was celebrated with civic and military parades. The U. S. government building, which furnishes accommodation for the post-office and national courts, was built in 1884. The municipal hall is a stone structure with a tower 175 ft. high. A fine Exposition building, with valuable contents, was destroyed by fire, but a new one has been commenced at the apex of the triangle occupied by the city, and will be completed in 1889.

Pittsburg has 26 national banks, with a capital of \$10,620,000; 5 private banks, capital \$700,000; 7 State banks, capital \$1,815,300; 14 savings banks, \$11,964,850. There are 19 blast furnaces in Pittsburg besides 5 in the vicinity, 36 iron- and 20 steel-mills. The capacity of the iron-mills is 780,000 tons yearly, and their actual output is about 580,000. The output of rails in 1887 was 360,000 tons; of iron pipes, 320,000 tons; of railway supplies, 132,000 tons; of crucible steel, about 42,000 tons; of Bessemer steel, 360,000 tons. Glass is largely manufactured in Pittsburg and the use of natural gas has increased the amount. There are 15 factories making window-glass, 9 making bottles, 16 making table-ware, 4 making fancy ware, 7 making lamp-chimneys, and 1 making mold-ware. The capacity of the plate-glass manufacture is now 250,000 sq. ft. per month. There are also locomotive-works with a capacity of 200 yearly, manufactures of steam-engines, fire-proof safes, brass, copper, lead, bronze and tin works, manufactures of iron chains, nuts and bolts, shot-towers, tanneries, factories making Britannia ware, paper-bags, carbon-points, boots and shoes, white-lead, etc. Pittsburg has the largest cork-factory in the world. The lumber trade in 1887 amounted to 2,000,000 ft., and the pork-packing to 108,000,000 pounds.

During the civil war 164 companies of soldiers were raised for the Union army in Allegheny county and 30 more were recruited from it. The official records of Pennsylvania give it credit for 23,000 soldiers, of whom 4000 perished in the struggle. The Subsistence Committee, a voluntary association organized in July, 1861, gave meals to 409,745 soldiers passing through Pittsburg, and relieved 79,460 sick and wounded at the Soldiers' Home. The Sanitary Fair held in June, 1864, realized \$361,516, part of which was used in endowing the Western Pennsylvania Hospital, and the rest for the aid of the soldiers. In July, 1877, a strike took place among the employés of the railroads passing through Pittsburg. The weakness and inefficiency of the mayor allowed a riotous mob to seize and destroy railroad property there to the value of more than \$2,500,000. The

See Vol. XIX.
p. 150 (p. 160
Am. Rep.)

State militia was called out and suppressed the riot. Allegheny county was subsequently held responsible for the damage done to property, and an attempt to transfer the burden to the State was defeated.

PITTSFIELD, a city of Massachusetts, shire-town of Berkshire county, is on a beautiful plateau, 1200 ft. above the sea. It is on the Boston and Albany and two other railroads. There are six lakes around it which give rise to the Housatonic River. The city has a marble court-house, 3 banks, several hotels, an atheneum with free library, 13 churches, some of which are notable for architecture, a high-school, 30 public schools, a young ladies' school, 2 weekly newspapers, and 2 parks. The lakes furnish water-power which is used in the manufacture of cotton and woollen goods, knit goods, silk, and tacks. The site of Pittsfield was granted to Boston in 1735, and was hence known as "Boston Plantation" until 1761, when it was incorporated under its present name. Its population in 1880 was 13,364.

PITTSTON, a borough of Luzerne co., Pa., is on the E. bank of the Susquehanna River, 9 miles above Wilkesbarre, and in the centre of the Wyoming coal-region. It is on the Lehigh Valley, the Erie and Wyoming Valley, and the Delaware, Lackawanna, and Western Railroads. The last-named road crosses the Susquehanna River here by a bridge, and there are two other bridges connecting the borough with West Pittston, a village of nearly 4000 inhabitants, which is chiefly used as a place of residence. Pittston itself is a mining town, though there are also several manufacturing industries, including 3 knitting-mills, a silk-mill, and foundries producing stoves, car-wheels, engines, and iron-roofing. It has 3 hotels, a national bank, and 2 other banks, 1 weekly and 2 daily newspapers, 18 churches, and 8 graded schools. It has a park and water-works, and is lighted with both gas and electric light. The assessed valuation of its property is \$725,922, but the actual value is over \$1,000,000. The public debt is \$35,000, and the yearly expenses are \$11,000. The first house on the site was built by Zebulon Marcy in 1770. The borough was incorporated in 1852. The population is largely of foreign birth and in 1880 amounted to 7472.

PLAINFIELD, a city of New Jersey, in Union co., is on Green Brook, 24 miles W. S. W. of New York city, by the N. J. Central Railroad. It has 2 national banks, 14 churches, good public and private schools, and 2 weekly newspapers. The manufactures are of hats, clothing, and machinery. Plainfield was laid out in 1735 and made a city in 1869. It has become a favorite place of residence for persons doing business in New York. Its population in 1880 was 8125.

PLANE, a tree of the genus *Platanus*, order *Platanaceæ*, well known under the common names of buttonwood and sycamore, the latter a misnomer, as the real sycamore is a very different tree. The order contains but one genus, *Platanus*, and three species, two of which are natives of the United States. It is classed by some writers with the bread-fruit family, which it resembles in many particulars. The planes are distinguished by their broad leaves, globular inflorescence and fruit, and watery juice. The leaves are 5 to 6 inches long, and 7 to 8 broad, with 5 lobes and long foot-stalks. The leaf-buds end in the leaf-stalk, and by their expansion break the articulation of the previous leaves, so that the plant is necessarily deciduous. The young shoots, leaves, and stipules are thickly covered with a fine down, which falls off as they expand and floats in the air. When breathed in it is apt to produce a disagreeable and persistent cough, for which reason it is objectionable to plant these trees too near to dwellings. The female catkin of the plane is a globular ball, less than an inch in diameter, borne on a flexible, downy footstock from 2 to 5 inches long. The flowers are so small as to be imperceptible. The male catkins are globes of about $\frac{1}{4}$ inch in diameter, borne on slender, thread-like stalks of an inch or two

in length. The stamens are very numerous, each of two cells opening at the sides and filled with white pollen. They are surmounted by brownish-green glandular disks which form the surface of the ball. The ripened seeds are small and light, yet have the structure of nuts. They remain on the tree until the ensuing spring, when they are dispersed by the bristly down attached to them. A marked feature of the planes is the character of their bark, which is deficient in toughness and extrusibility, while its layers have little mutual adhesion. In consequence the outer layers are apt to crack and scale off in large irregular patches, revealing the whitish inner bark. This peculiarity gives the plane a different appearance from any other tree. The planes are large, spreading trees, and have long been highly esteemed as shade-trees.

The Oriental plane (*Platanus orientalis*), a native of the Levant, is a tree of great size, growing to the height of 80 feet and sometimes higher, and occasionally of immense diameter, while its thickly leaved branches spread widely from the trunk. It was a favorite tree in ancient times, the Romans particularly valuing it as a shade-tree. It is still much esteemed in the East, and is a great favorite in Persia. Its wood, which has a beautiful surface, and takes a brilliant polish, is much used in carpentry, joining, cabinet-making, and even in ship-building.

The occidental plane (*P. occidentalis*), the buttonwood of the eastern United States, is the largest and loftiest of American deciduous trees. It has a massive column or trunk, tapering rapidly to some distance from the ground, and then ascending with a very slight taper. Specimens have been measured on the banks of our western rivers of from 40 to 50 feet diameter and 100 feet high, but such dimensions as these are very seldom attained. The tree is a very rapid grower, especially near water, and sends its lower limbs out horizontally, while the density of its foliage makes it an excellent shade-tree. The leaves are less palmated than those of the oriental plane, are large in size and seldom injured by insects, while they cluster so thickly as to throw a very dense shade. The wood is of little use in the arts, being perishable if exposed to the weather, and liable to warp, but it makes good fuel when grown on dry soil. The bark of the plane has some astringency, and the leaves have been used in fomentations. They were formerly considered an antidote to the poison of serpents. The American plane has a wide distribution, extending from the Atlantic to the States west of the Mississippi and as far north as Montreal, where it is called the cotton tree.

A third species occurs on the Pacific coast, the California plane (*P. racemosus*). It is a well-distinguished species, its leaves being deeply cleft, and very downy when young, while their under surface continues covered with a white woolly down, that gives them the feeling of thick woollen cloth. The male catkins are smaller than peas. The female catkins grow in racemes with from 3 to 5 pendent balls, the styles being remarkably long and persistent on the ripe balls. The tree has a very unusual appearance with its long pendular racemes, nine inches long, each with from 3 to 5 balls. The wood is superior to that of *P. occidentalis*.

(C. M.)

PLATTSBURG, a city of New York, seat of Clinton co., is on the W. shore of Lake Champlain at the mouth of the Saranac River, and on the railroad of the Delaware and Hudson Canal Company, 63 miles S. of Montreal. Two fine iron bridges cross the river. The Chateaugay and the Au Sable Railroads lead into the Adirondack region. In the summer a steamboat runs daily to Fort Ticonderoga, 70 miles south, and others run to Burlington, Vt., and various points of interest on the lake. Plattsburg has 5 hotels, 4 national banks, 1 daily and 4 weekly newspapers, 7 churches, a high-school, and six other schools. Its industries comprise an iron-furnace, machine-shops, sewing-machine-works, wagon-factory, and planing-mills. It has water-

works and 2 small parks, and is lighted with gas and electric light. Lumber, iron, and grain are shipped here. In 1880 the population of the village was 5245 and of the township 8283. On Sept. 11, 1814, General A. Macomb here repulsed a superior British force, while on the adjacent Cumberland Bay Commodore McDonough gained a complete victory over the British fleet at the same time.

PLAYFAIR, SIR LYON, a British chemist and publicist, was born at Meerut, Bengal, May 21, 1819. He was educated at St. Andrews, Scotland, and studied chemistry under Prof. Thomas Graham at Glasgow and afterwards at London. In 1838 he went to Giesesen to study organic chemistry under Liebig, some of whose works he translated into English. On his return he had charge of calico-print-works at Clitheroe and in 1843 he was made professor of chemistry in the Royal Institution at Manchester. He was employed by the government in various commissions and especially in connection with the World's Fair of 1851. For his services he was made a C. B., and in 1853 was made joint-secretary with Henry Cole, of the newly established department of Science and Art. In 1856 he was appointed inspector-general of the Government museums and schools of science. In 1858 he was called to the chair of chemistry in the University of Edinburgh, and in 1868 was elected to Parliament for the Universities of Edinburgh and St. Andrews. In 1873-74 he served in Mr. Gladstone's cabinet, being postmaster-general and member of the privy council. He was president of the commission which in 1874 presented the plan for the reorganization of the civil service. After the election of 1880 he was made deputy speaker of the House of Commons and chairman of ways and means. On retiring in 1883 he was made K. C. B. Besides his technical work Dr. Playfair has published several lectures on educational and sanitary matters.

PLEASANTON, ALFRED, general, was born at Washington, D. C., June 7, 1824. He graduated at West Point in 1844 and entered the dragoons. He fought in the Mexican war under Gen. Taylor and was brevetted for gallantry. He afterwards served on frontier duty and as assistant adjutant-general. He conducted his regiment from Utah to Washington on the outbreak of the civil war. He served creditably in McClellan's Peninsular campaign and was made brigadier-general of volunteers in July, 1862. When Lee's army invaded Maryland Pleasanton commanded the division of cavalry which followed them, and was engaged at Antietam. By his bravery and skilful management at Chancellorsville (*q. v.*) he checked "Stonewall" Jackson's attack. Being promoted major-general in June, he had chief command of the cavalry at Gettysburg (*q. v.*) In 1864 he was transferred to Missouri, and freed that State from the invasion of Gen. Sterling Price. In March, 1865, he was brevetted major-general U. S. A. In 1866 Gen. Pleasanton was mustered out of the volunteer service and in 1868 he resigned also from the regular army, believing that his claims to promotion had been slighted. He was U. S. collector of internal revenue for some years and afterwards president of the Terre Haute and Cincinnati Railroad. In May, 1888, he was placed on the retired list of the army with the rank of colonel.

PLOUGH. See AGRICULTURE, Chap. III. (1).

PLUM, the name given to *Prunus domestica*, a tree of the order *Rosacea*, which differs from the cherry chiefly in having a larger and richer fruit, which ripens later in the season. Prof. Gray says that the distinction between the plum and the cherry, while very perceptible, is hard to define botanically, none of the botanical distinctions being constant. The common plum is supposed to have originated from the bullace, *P. insitita*, a native of Europe, with a black fruit covered with a yellow bloom, and from *P. spinosa*, the sloe, a thorny shrub, commonly called

blackthorn from its black bark. Its fruit is a globose black drupe, covered with a fine blue bloom when ripe. The plum is said to be a native of Southern Russia, the Caucasus, and the Volga region.

The domestic plum resembles the sloe, though larger and destitute of spines. It is from twelve to twenty feet high, with dark green, lanceolate leaves and solitary flowers of white color, having twenty to thirty stamens with orange anthers, and one and sometimes two styles. The fruit is covered with a fine bloom, and contains a smooth surfaced stone, sharp pointed at the ends and with a longitudinal furrow passing around it. There are very numerous varieties, which differ greatly in size and flavor, some being two inches long, while others are less than an inch. Among the varieties the greengage is the most esteemed for sweetness and flavor. It is a delicious dessert fruit, while some of the inferior varieties are very sour and harsh in taste. The Damson, another well-known variety, probably received its name from Damascus, which was formerly celebrated for its plums. The plum is a very hardy plant, and is cultivated throughout Europe, from Norway to Barbary, and widely in the United States, in which country many choice varieties have originated, some of them of great size and beauty of fruit. It is less grown here than formerly, however, on account of the ravages of the curculio and of other diseases. Another species of the same genus, the apricot (*P. Armeniaca*), is widely raised in Europe, but is only occasionally cultivated in the United States. It is a native of Armenia, growing from fifteen to thirty feet high, and bearing a fruit which resembles the peach, of roundish shape and yellow color, ruddy on the side next the sun, the flesh being yellow and juicy.

The sloe and bullace are both naturalized in the United States, and there are four native species of *Prunus* known here. *P. Chickasaw*, the Chickasaw plum, is a shrub or small tree of the Southern States, which bears a thin-skinned, yellowish-red fruit of agreeable flavor. *P. Americana*, the wild yellow or red plum, is a bushy tree eight to twenty feet high, bearing a roundish, oval fruit of two-thirds inch diameter, with a tough skin, but pleasant-flavored pulp. It has a wide range from Canada to Georgia, and has been cultivated. The beach plum, *P. maritima*, is a low, straggling shrub, which is found on sandy coasts from Massachusetts to New Jersey, one variety reaching to Alabama. Its fruit is often an inch in diameter, and of pleasant taste, but somewhat astringent. *P. glandulosa*, of Texas, is less than a foot high, with very crooked, thorny branches.

The finer varieties of the plum form choice table-fruit, while the inferior kinds are used in pies, preserves, and sweetmeats. In moderate quantity plums are wholesome, but are apt to produce colic and diarrhoea if eaten to excess, particularly if not fully ripe. A pleasant wine is made from them in Europe, and in some places a strong spirit is distilled from the fermented juice. The dried plum, under the name of prune, is a favorite dessert article, and great quantities are thus prepared in Europe. Many of the inferior grades are sun-dried, the better qualities carefully heat-dried. The best prunes come from France, while large quantities are produced in Spain and Turkey, and many of a coarse quality in Germany. The prunellos, the finest grade of prunes, are made from the greengage and the St. Catharine plum. These afford a delicious and highly esteemed table-fruit.

(C. M.)

PLUMBAGO.—The mineral known under the two names of Plumbago and Graphite, and See Vol. XIX. p. 230 (p. 242 Am. Rep.). also frequently but incorrectly called Black Lead, is one of the several forms assumed by carbon, the others being diamond and coal. It occurs in considerable abundance in many parts of the world, being found in laminae or masses in the granite, gneiss, mica, schist, and crystal-

line limestone of the primary geological strata. Concerning its origin mineralogists are in ignorance, though it is generally believed that it was derived from very ancient vegetation, which has left no other trace of its existence. It is often found in coal veins where traversed by trap-rock, indicating that the coal has been transformed into plumbago by heat. It is also produced in iron furnaces, crystallized in flat flakes in the cavities of cast-iron. As found in the rocks it is composed of pure carbon, with a little iron oxide mechanically mixed, and occurs in foliated prismatic masses, and also in a compact granular form. It is infusible, very difficult of combustion, and of a lead-like metallic lustre, from which, and the readiness with which it leaves a black mark on paper, it has received its name of black lead.

Plumbago is utilized in several important methods, of which the best known is its employment in the manufacture of lead pencils. For this purpose it is used either in its pure state, or ground up and mixed with clay. For the finer grades of pencils plumbago free from impurities is required. This is attained by grinding and removing all impurities and then condensing by pressure, or by selecting pure natural graphite and cutting it into appropriate sizes. A second important use is in the manufacture of retorts and crucibles, to which its high resistance to heat well adapts it. For this purpose it is mixed with fire clay, thus forming one of the most refractory substances known. Plumbago crucibles are used largely in the manufacture of Bessemer steel. Another important use is that of dry lubrication, as in producing smoothness of action between the frictional surfaces of the piano and organ. Plumbago, thus applied, must be absolutely free from grit. Recently it has come into extended use as a general lubricant for machinery. Mixed in proper proportions with an oily substance it makes a perfect lubricant, which remarkably reduces friction, and is unaffected by heat or cold, steam or acids. Others of its uses are for pigments, and for polishing iron surfaces, while in foundries it is employed as a facing for moulds in order to produce a smooth surface in casting. In this particular it is of great utility. As it is a good conductor of electricity, it is sometimes used to coat moulds in electrotyping.

Plumbago is found in many parts of the earth, but in few places in sufficient purity for profitable working, it being generally mixed in the vein with slaty and other impurities. Very pure plumbago was formerly extracted from the Borrowdale mines of England. This was of sufficient purity to be sawn directly into pencils, as is now done with that extracted from the Alibert mine of Siberia. The great source of the present supply of plumbago is the island of Ceylon, where a very pure quality is obtained. It is mined also in several European localities.

Plumbago is distributed widely throughout the United States and Canada, though in few places in sufficient purity for profitable working. It is found at intervals along the whole line of the Alleghenies, in California, and in several other localities, but in few places in sufficient purity to warrant its mining. The Eureka mine of Sonora, California, is said to be capable of yielding 1000 tons monthly. The only place where plumbago is now mined successfully in the United States is at Ticonderoga, Essex co., N. Y. Of this place we are told in the *Mining Resources of the United States*, 1883-84: "The vein there has been worked to a depth of 600 feet. The graphite schist or vein is about 15 feet thick, carrying from 8 to 15 per cent. of graphite, and is practically inexhaustible. This mine is unusually rich, for it perhaps produces the finest graphite in the world." It contains occasional pockets of graphite of the finest quality, consisting of 99.9 per cent. of carbon. This is the purest known, and is particularly well adapted for pencil-manufacture. (See PENCILS.) (C. M.)

PLUMBING. See SANITARY SCIENCE.

PLUMER, WILLIAM SWAN (1802-1880), clergyman and author, was born at Griersburg, Pa., July 25, 1802. He graduated at Washington College, Va., in 1825, studied theology at Princeton, and was ordained to the Presbyterian ministry in 1827. He served several churches in Virginia and North Carolina, and while at Richmond was editor of *The Watchman of the South* (1837-45). In 1838 he was moderator of the Presbyterian General Assembly. He was afterwards pastor in Baltimore, and in 1854 was called to a professorship in the Western Theological Seminary at Allegheny City, Pa. On account of his sympathy with the South in the civil war he was obliged to retire in 1862, when he removed to Philadelphia. In 1866 he became professor in the Theological Seminary at Columbia, S. C., and held that position until 1880, having in 1871 been moderator of the Southern Presbyterian General Assembly. He died at Baltimore, Oct. 22, 1880. In theology he was an extreme Calvinist. He published *The Law of God*, an exposition of the Ten Commandments (1864), *The Grace of Christ* (1853), *Vital Godliness* (1865), *Pastoral Theology*, *Studies in the Book of Psalms* (1866), *Commentaries on the Romans and the Hebrews* (1870), besides numerous tracts and minor works.

PLUMPTRE, EDWARD HAYES, English clergyman, was born in London, Aug. 6, 1821. He was educated at University College, Oxford, and on graduating in 1844 became fellow of Brasenose College. He was chaplain of King's College, London, from 1847 to 1868, being also professor of pastoral theology there from 1853 to 1863, and of exegesis from 1864 to 1881. He was also dean of Queen's College, London, from 1855 to 1875, when he was made its principal, but he resigned in 1877. He was chosen select preacher at Oxford in 1851, 1864, and 1872, and Boyle lecturer in 1866. In 1869 he was made rector of Pluckley, Kent, and in 1873 vicar of Bickley, which position he held till 1881, when he was made dean of Wells. He took part in the revision of the English Bible, and in 1875 the University of Glasgow conferred on him the degree of D. D. Besides contributing to *Smith's Bible Dictionary* he annotated the *Book of Proverbs* in the *Speaker's Commentary*, the first three *Gospels*, *Acts*, and *Second Corinthians* in Bishop Ellicott's *New Testament Commentary*, and *Isaiah* and *Jeremiah* in the *Old Testament Commentary*. He assisted also in the *Cambridge Bible* and other commentaries, edited the *Bible Educator* (1875) and published the *Biblical Studies* (1870) and *Introduction to the New Testament* (1883). He has also published *Epistles to the Seven Churches* (1877); *Movement of Religious Thought* (1879); *Things New and Old* (1884); *Spirits in Prison* (1884); and *Life of Bishop Thomas Kerr* (1886). Dean Plumtre is also favorably known by his poems and especially his excellent translations of *Sophocles* (1865) and *Æschylus* (1868), and of *Dante* (2 vols., 1887). His original poetical works are *Lazarus* (1864) and *Master and Scholar* (1866).

PLYMOUTH, the shire-town of Plymouth co., Mass., is situated on Plymouth Bay, part of Cape Cod Bay, 37 miles S. E. of Boston, at the terminus of a branch of the Old Colony Railroad. Here the Pilgrim Fathers landed on Dec. 21, 1620, and founded their first settlement in America. Plymouth village is at the north end of the "town," which is altogether about 16 miles long and 6 miles wide. The "town" contains large tracts of woodland and 180 ponds, of which 135 bear names and are well stocked with perch, pickerel, etc. The village contains Pilgrim Hall, in which memorials of the Pilgrims of the Mayflower are preserved. In front of it is a portion of the rock on which they first stepped. The rock itself is in Water street, and is now covered by a granite canopy. The village has also a town-hall, a court-house, 2 national banks, 2 savings banks, 2 weekly newspapers, 11 churches, a high-school, and 30 graded schools. Manufactures are extensively carried on, the chief prod-

ucts being cordage, nails, tacks, rivets, shoes, shoe-shanks, cotton, duck, and seamless pockets. There are also 2 zinc-rolling-mills and an iron-foundry. The village is modern in appearance, is lighted with gas, and has water-works, the cost of which, about \$100,000, constitutes its public debt. The property is valued at \$5,000,000 and the yearly expenses are about \$60,000. The town is much resorted to by summer visitors, there being 7 hotels, and 7 trains daily to and from Boston, besides daily trips by steamboat in the summer.

PLYMOUTH, a borough of Pennsylvania, in Luzerne co., on the east bank of the Susquehanna River, is on the Delaware, Lackawanna, and Western Railroad, 8 miles from Wilkesbarre. It is a coal-mining town with 6665 population in 1880. It was in 1885 the scene of a serious epidemic of typhoid fever, which was eventually traced to the contamination of the water-supply by the excreta of a single family some months previous.

POEY Y ALOY, FELIPE, a Cuban naturalist, was born at Havana, May 26, 1799. Though his father was a Frenchman, he was educated at Havana, and in 1823 became a lawyer there. His inclination for natural history was so strong that in 1826 he went to Paris with drawings and specimens of Cuban fishes, which were submitted to Cuvier and Valenciennes. These eminent naturalists used his researches in their *Histoire Naturelle des Poissons*, giving him due credit. In 1833 Poey returned to Cuba and in 1842 he was appointed professor of comparative anatomy and zoölogy in the Royal University of Havana. Though hampered by want of means, Prof. Poey diligently prosecuted his researches in natural history. He made valuable contributions to the U. S. National Museum, to the Museum of Comparative Zoölogy at Cambridge, Mass., and to the Museum at Madrid. His chief contributions to science are *Memorias sobre la Historia Natural de la Isla de Cuba* (2 vols., 1855-60); *Synopsis Piscium Cubensium* (1868), which was revised under the title *Enumeratio Piscium Cubensium* (1875), but he has spent years in preparing a valuable *Ictiologia Cubana*, still in manuscript.

POINDEXTER, GEORGE (1779-1853), politician, was born in Louisa county, Va., in 1779. He began to practice law in his native State, but in 1802 removed to Mississippi Territory, where he was made attorney-general by Gov. Claiborne. In 1807 he was sent to Congress as Territorial delegate, and in 1813 he was appointed U. S. District Judge for Mississippi. When that State was admitted to the Union, in 1817, he was elected to Congress, and in 1819 he was elected governor. In 1831 he was sent to the U. S. Senate, and though he had formerly been a defender of Gen. Jackson, he now turned against him. Poinexter went to Kentucky in 1835, but afterwards returned to Mississippi, where he died at Jackson, Sept. 5, 1853.

POINSETT, JOEL ROBERTS (1779-1851), statesman, was born at Charleston, South Carolina, March 2, 1779. He was of Huguenot descent, was educated by Pres. Dwight at Greenfield, Conn., and afterwards studied medicine at the University of Edinburgh and military science at Woolwich. He spent some years in travel through Europe, visited the Calmuck Tartars and entered Persia. In 1809, being sent by Pres. Madison to examine the condition of the people of South America then in insurrection against the Spanish authorities, he established friendly relations with Buenos Ayres and then crossed the continent to Chili. While he was there the Spanish authorities seized several American whalships at Talcahuana, but Poinsett, with the aid of some Chilians, liberated the vessels. The British preventing his return by sea, he again crossed the Andes. After his return home he was elected to the Legislature and in 1821 to Congress. He also visited Mexico in 1822 to report upon the prospects of the empire established

by Iturbide. In 1825 he was sent as minister to that country and in spite of troubles due to revolutionary movements negotiated treaties with its government. He returned to Charleston in 1829 and became a leader of the Union party in the struggle against nullification. He was in constant correspondence with Pres. Jackson during this trying period and heartily approved the action of the national administration. After the nullification movement had failed Poinsett married and became a rice-planter. Pres. Van Buren called him from his retirement, in 1837, to be secretary of war. While holding this office he organized and equipped the Wilkes Exploring Expedition. He planned and founded the first National Museum at Washington. He reorganized the artillery service and strongly urged other improvements in army methods. Yet he stoutly resisted the movements leading to the Mexican war, which, however, in its course displayed effectively the value of his services to the military strength of the country. At the close of his term he retired again to his plantation at Statesburg, S. C., where he died Dec. 12, 1851. See Dr. C. J. Stille's "Life and Services of J. R. Poinsett" in *Penna. Magazine of History and Biography* (1888).

POISONS. The subject of toxicology has been very fully treated in the *ENCYCLOPEDIA BRITANNICA*, and this article will be devoted to a brief statement of antidotes. An antidote is a substance which is used for the purpose of overcoming the deleterious effects of some poison upon the animal system. There are two kinds of antidotes—physiological and chemical. Physiological antidotes are uncertain in their action and require for their use a thorough knowledge of physiology and pathology. We shall not, therefore, discuss them in the present article.

Chemical antidotes act usually by forming with the poison a new compound which is inert so far as the human system is concerned. With but one exception they are incapable of acting when the poison has been absorbed. The exception is a very important one in that it is the antidote of a very common poison, carbolic acid. This antidote is a soluble sulphate, especially the sulphate of magnesium or Epsom salt, or the sulphate of sodium or Glauber's salt. It seems to have the power of forming a harmless sulpho-carbolic acid in the blood as well as in the alimentary canal.

The antidotes are best studied for practical purposes under general heads.

All mineral and vegetable acids, with but one single exception, are neutralized and rendered innocuous by ordinary alkalies or alkaline earths. The exception is *oxalic acid*, whose salts of potassa and soda are as poisonous as is the acid itself. The antidote is lime, the oxalate of lime formed being completely insoluble and inert.

In applying an antidote to an acid time is of the utmost importance, and as soap is usually at hand, and is very effective, it is the most frequently employed of all the alkaline substances.

The alkalies are also more or less antidotal to most of the *mineral salts*, the principal exceptions being, 1. *Corrosive sublimate*. The yellow oxide of mercury, which is formed when an alkali is added to corrosive sublimate, although less poisonous than the corrosive sublimate, is very deleterious in its action upon the system. 2. *Tartar Emetic*. The oxide of antimony acts less promptly but scarcely less certainly than tartar emetic itself, and consequently we are not able to employ it in tartar emetic poisoning. Tannic acid, though not a perfect antidote, is still the best we have for the salts of antimony. 3. *Arsenic*. The antidote to arsenic and its soluble preparations is some form of the hydrated sesqui-oxide of iron. It is necessary that this antidote be freshly prepared, be given in a moist state and in great excess. If it has long been prepared it is nearly useless. It should, therefore, be made when wanted by precipitating the tincture of the

chloride of iron, the solution of the per-sulphate of iron, dialyzed iron or some other soluble sesqui-compound of iron, by an alkali. Ammonia is frequently employed as the alkali, but in order to free the precipitate from it much washing is required, and as time is a matter of the greatest importance, it is therefore preferable to add to the iron solution magnesia in excess. The powder which falls after such treatment is a mixture of the hydrated sesqui-oxide of iron and magnesia, and is believed by many chemists to be superior to the hydrated sesqui-oxide of iron as an antidote to arsenic. It is the official *antidotum arsenici* of the Prussian Pharmacopœia and has been officially recognized in the last revision of the U. S. Pharmacopœia (*Ferri-Oxidum Hydratum cum Magnesia*, U. S. P., 1880). 4. *Nitrate of Silver*. It has for its antidote common salt, which is very much more effective than soap or the alkalis.

Alkaline Poisons have for their antidote vegetable or dilute mineral acids. When these are not to be had, or even if they be used, it is very well, in most cases, to administer bland oils, which act in part by forming a soap with the alkali, and in partly mechanical sheathing the stomach and bowels from the local action of the poison.

Of the *neutral or elementary poisons* one of the most important is phosphorus, whose antidote is not, as was formerly thought, freshly calcined magnesia or a fixed oil, but sulphate of copper. Very old European oil of turpentine is also antidotal and official, but American emulsions seem to have no such property.

Very few *vegetable poisons* have reliable chemical antidotes, but tannic acid forms with alkaloids salts which are not readily dissolved in the stomach and absorbed. Whenever a poison containing an alkaloid has been taken, tannic acid or nutgalls may be given, and follow immediately by an emetic and such a cathartic as castor oil, in order to remove the only partially inert tannate. Mustard flour is the most rapidly acting and easily attainable emetic in poisoning. A tablespoonful may be given at once in a tumblerful of water and repeated in fifteen minutes if required. The principal poisons depending for their activity upon an alkaloid are *opium*, *belladonna*, *hyoscyamus* or *henbane*, *stramonium* or "*Jimson weed*," *nux vomica*, *hemlock* or *conium*, *water hemlock*, *Calabar bean*, *poisonous mushrooms*, *veratrum viride*, *aconite*, *digitalis*, *Gelsemium* or *yellow jessamine*. *Strychnia* and *morphia* are alkaloids. (H. C. W.)

POLAR REGIONS. See ARCTIC EXPLORATIONS.

POLITICAL CONVENTIONS form the present customary method in the United States of nominating persons to be voted for at elections. These conventions are of various grades, State, city, county, and Congressional district, but all are conducted in practically the same way. The citizens of a political party are invited to meet at a primary election in their precinct, or division, to choose delegates to these conventions, who are in theory free to name candidates and to vote according to their own judgment on the names presented. In some cases, however, the people vote also directly for the candidate and the delegate is required simply to register the will of the majority of those who elected him. The dangers and difficulties attending this method and others which have been used are discussed under CAUCUS (*q. v.*) This article will give simply a brief outline of the various national conventions.

As early as September, 1812, a convention in which eleven States were represented was held in New York, and nominated DeWitt Clinton for the Presidency. Madison, then President, had already been nominated for a second term by a Congressional caucus. Both candidates and their respective followers belonged to the Republican party, but Madison, having the "regular" nomination, was elected. The system of nominating by Congressional caucus fell

to pieces in 1824, when only one-third of the Republican members of Congress attended the caucus which nominated William H. Crawford. Other candidates were presented in various ways, and, there being no choice by the people, the House of Representatives elected John Quincy Adams. Andrew Jackson, who had received a plurality of the electoral votes, was forthwith nominated by the Legislature of Tennessee as presidential candidate for the next election, and this action being approved by the Democratic party throughout the country, he was elected in 1828 over Pres. J. Q. Adams, who refused to use his power of patronage to assist his own election.

In September, 1830, a national conference of citizens opposed to Free Masonry (see ANTI-MASONRY) was held in Philadelphia. It had been called by the New York Anti-Masonic State Convention, and was presided over by Francis Granger of that State. It called a national nominating convention, which met in Baltimore, Sept. 26-28, 1831, and nominated William Wirt, of Maryland, for President, and Amos Ellmaker, of Pennsylvania, for Vice-President. The example of this first national political convention was followed by the "National Republican" convention which assembled in Baltimore, Dec. 12, 1831. James Barbour, of Virginia, presided; Henry Clay, of Kentucky, was unanimously nominated for President, and John Sergeant, of Pennsylvania, for Vice-President. The Democratic party also adopted this method in the following May and held a convention at Baltimore, at which Martin Van Buren was selected as candidate for Vice-President, a second term of Presidency having been already conceded to Jackson. (See DEMOCRATIC PARTY.)

In May, 1835, a national Democratic convention was held at Baltimore, 21 States being represented, and Andrew Stephenson, of Virginia, presided. At this convention the present rule of the Democratic party requiring a two-thirds vote to insure a nomination was adopted. Martin Van Buren was then unanimously nominated for President, and Richard M. Johnson, of Kentucky, was chosen for Vice-President, receiving 178 votes to 87 votes for William C. Rives, of Virginia. Gen. William H. Harrison, of Ohio, the opposition candidate to the Democracy in 1836, was nominated by a State convention in Pennsylvania and by several other bodies.

In 1839 a national Whig convention was held in Harrisburg, Pa. James Barbour presided, and Gen. Harrison was nominated for President on the first ballot, receiving 148 votes. John Tyler, of Virginia, was selected as Vice-President. In December, 1839, a convention of Abolitionists was held at Warsaw, N. Y., and nominated James G. Birney, of New York, for President and Francis J. Lemoyne, of Pennsylvania, for Vice-President. On May 5, 1840, a national Democratic convention assembled at Baltimore and Martin Van Buren was unanimously renominated, but no choice was made for a Vice-President. This was the first convention to frame a platform, declaring the ideas and wishes of the party.

A national Whig convention met at Baltimore on May 1, 1844, nominated Henry Clay, of Kentucky, for President by acclamation; and chose for Vice-President T. Frelinghuysen, of New Jersey. On May 27 the national Democratic convention met in the same city. The two-thirds rule was adopted, and after a session of 3 days James K. Polk, of Tennessee, was nominated for President. Silas Wright, of New York, was selected for Vice-President, but declined, and George M. Dallas, of Pennsylvania, was chosen to fill his place. On the first ballot Martin Van Buren had 146 votes, Lewis Cass 83, R. M. Johnson 29, and James Buchanan 4. Van Buren's name was withdrawn after the 8th ballot; and on the 9th Polk received 233 votes, to 29 for Cass and 2 for Van Buren. The national convention of the Liberty party met in Buffalo, N. Y., Aug. 30, 1844, and nominated James G. Birney, of

Michigan, for President and Thomas Morris, of Ohio, for Vice-President.

The national Whig convention of 1848 was held in Philadelphia, June 7-10, Gen. Zachary Taylor being nominated for President on the 4th ballot and Millard Fillmore, of New York, for Vice-President. Taylor's principal competitor was Clay. The national Democratic convention assembled at Baltimore, May 22, 1848; Lewis Cass was selected as the candidate for the Presidency on the 4th ballot; and William O. Butler, of Kentucky, for Vice-President. The Free Soil Democratic convention assembled on June 22, 1848, at Utica, N. Y., but only 3 States were represented. It placed in nomination Martin Van Buren for President and Henry Dodge for Vice-President. The latter subsequently declined. On Aug. 9 a larger convention of those holding Free Soil views met in Buffalo, 17 States being represented by delegates. This body nominated Martin Van Buren for President and Charles Francis Adams for Vice-President. (See FREE SOIL PARTY.)

The national Whig convention of 1852 assembled on June 16, in Baltimore, and was in session 6 days, during which time 53 ballots were taken, commencing with 131 for Gen. Winfield Scott, 133 for Fillmore, and 29 for Webster; and continuing, with very little variation, until the last, when Scott had 159, Fillmore 112, and Webster 21. In the same city the national convention of the Democratic party met on June 1, and on the 49th ballot selected Gen. Franklin Pierce, of New Hampshire, as its candidate for the Presidency. The 1st ballot stood: Cass, 116; Buchanan, 93; Douglas, 20; Marcy, 27; Lane, 13; Houston, 8; Dodge, 3; Butler, 2; and Dickinson, 1. Cass rose to 131 on the 35th ballot, when the name of Pierce was presented, and on the 49th ballot the vote stood: Pierce, 282; Cass, 2; Buchanan, 2; Butler, 2. W. R. King, of Alabama, was then nominated for the Vice-Presidency. The Free Soil Democrats held a national convention at Pittsburg on Aug. 11, 1852, and nominated John P. Hale, of New Hampshire, for the Presidency, and George W. Julian, of Indiana, for Vice-President.

The first national Republican convention was held on June 17, 1856, at Philadelphia. (See REPUBLICAN PARTY.) After an informal ballot which resulted as follows, Fremont, 359, McLean, 196, John C. Fremont was declared nominated. Upon the same ticket was placed William L. Dayton, of New Jersey, as Vice-President. The American national council met in Philadelphia Feb. 19, 1856, and nominated Millard Fillmore for President and Andrew Jackson Donelson for Vice-President. The Democratic convention of 1856 met at Cincinnati on June 2, and cast 17 ballots. The 1st ballot stood: Buchanan, 135; Pierce, 122; Douglas, 33; Cass, 5. Pierce's votes were given to Douglas on the 15th ballot, but without effect; and on the 17th Buchanan was nominated.

The national Republican convention met in Chicago May 16, 1860, with delegates in attendance from all the free States, and also from Delaware, Maryland, Virginia, Kentucky, Missouri, Texas, and the Territories of Kansas and Nebraska, and the District of Columbia. Three ballots were taken for President, each delegate casting a half-vote; on the last the vote was: Lincoln, 231½; Seward, 180; Chase, 24½; Bates, 22; McLean, 5; Dayton, 1; C. M. Clay, 1. As this gave Lincoln within 2½ of a nomination, several delegations changed their ballots and gave him 354 votes. Hannibal Hamlin was nominated for Vice-President. A convention of the Constitutional Union party met in Baltimore on May 9, and nominated John Bell, of Tennessee, for President, and Edward Everett, of Massachusetts, for Vice-President. The national Democratic convention of 1860 met in Charleston, S. C., on April 20, delegates being present from all the States. The Territories are not allowed a vote in

Democratic conventions. After a stormy debate upon a platform a part of the delegates left the convention, and those that remained proceeded to ballot. The 1st ballot stood: Douglas, 145½; Guthrie, 35; Hunter, 42; Dickinson, 7; H. V. Johnson, 12; Lane, 6; Jefferson Davis, 1½; Toucey, 2½; Pierce, 1. The 57th ballot stood: Douglas, 151½; Guthrie, 68½; Hunter, 16; Dickinson, 4; Lane, 14; Davis, ½. The convention then adjourned to meet in Baltimore June 13, and there on the 2d ballot Stephen A. Douglas was declared the choice of the convention for President, and Benjamin Fitzpatrick, of Alabama, was nominated for Vice-President. When he declined Herschel V. Johnson, of Georgia, was put in his place. The delegates who had withdrawn from the Charleston convention immediately assembled at St. Andrew's Hall, in that city, and, after adopting a series of resolutions, adjourned to meet in Richmond, Va., on June 10. This body, after a number of meetings, finally indorsed the nomination of Breckinridge and Lane. On June 28 the delegates who did not participate in the convention that nominated Douglas and Johnson assembled in Baltimore, and proceeded to ballot for a candidate for President. John C. Breckinridge, of Kentucky, received the unanimous vote of the 105 delegates present, representing 20 States. For Vice-President Gen. Joseph Lane, of Oregon, was nominated.

On May 31, 1864, a convention to organize a new party under the name of the "Radical Democracy" met at Cleveland, issued an address to the people, and nominated John C. Fremont for President, and John Cochrane, of New York, for Vice-President. These candidates were subsequently withdrawn. The national Republican convention of 1864 assembled in Baltimore on June 7; Robert J. Breckinridge, of Kentucky, was its president. Abraham Lincoln was renominated on the 1st ballot by a unanimous vote, with the exception of the vote of Missouri, which was cast for Grant. For Vice-President Andrew Johnson was nominated on the 1st ballot. The national Democratic convention of 1864 met at Chicago, Aug. 20. Horatio Seymour, of New York, was appointed permanent chairman. The vote was: George B. McClellan, 202½; Horatio Seymour, 23½. George H. Pendleton was nominated for Vice-President on the 2d ballot.

The national Republican convention met at Chicago May 21, 1868. Gen. Joseph R. Hawley, of Connecticut, was selected as President. A ballot was taken, and the president announced that 610 votes had been cast, all for Ulysses S. Grant. On the 5th ballot for Vice-President Schuyler Colfax, of Indiana, received 522 votes and was nominated. On July 4, 1868, the national Democratic convention met in New York, Horatio Seymour presiding. The 1st ballot resulted: Pendleton, 105; Hancock, 33½; Church, 34; English, 16; Parker, 13; Packer, 26; Johnson, 65; Doolittle, 13; Hendricks, 2½; Blair, ½. On the 21st ballot the vote was: Hancock, 135½; English, 19; Johnson, 5; Doolittle, 12; and Hendricks, 132. On the 22d ballot all the States voted for Horatio Seymour, and he was declared the nominee. Gen. Frank P. Blair, of Missouri, was unanimously nominated for Vice-President.

The national convention of the Liberal Republican party met in Cincinnati on May 1, 1872, and opened the Presidential campaign of that year. Six ballots were taken. On the 1st Horace Greeley received 147 votes; C. F. Adams, 203; Trumbull, 110; Davis, 92½; Brown, 95; Curtin, 62; Chase, 2½. On the 5th ballot Greeley had 258, and Adams 309; but on the 6th ballot Horace Greeley was declared the nominee of the convention for President. On the 2d ballot B. Gratz Brown, of Missouri, was selected for Vice-President by a vote of 435 to 261. The national Republican convention of 1872 assembled in Philadelphia on June 5. Morton McMichael was chosen

temporary chairman, and Thomas Settle, of North Carolina, as permanent president. On the 1st ballot Ulysses S. Grant received the entire vote. For Vice-President Henry Wilson, of Massachusetts, was nominated over Schuyler Colfax on the 2d ballot. The national Democratic convention met at Baltimore, July 9, 1872, and all the ballots but 45 were cast for Greeley, who was declared the candidate for the party. B. Gratz Brown was nominated for Vice-President.

The convention of the Republican party for 1876 met at Cincinnati on June 15, having 752 members. Edward McPherson, of Pennsylvania, was permanent chairman. On the 1st ballot James G. Blaine had 285 votes; Morton, 125; Bristow, 113; Conkling, 99; Hayes, 61; Hartranft, 58; Jewell, 11; Wheeler, 3. The 7th ballot resulted: Blaine, 351; Bristow, 21, and Hayes, 384, or 5 more than a majority. William A. Wheeler received 366 votes for Vice-President on the 1st ballot. The Democratic convention met in St. Louis June 27. On the 1st ballot S. J. Tilden had 403½ votes; Hendricks, 133½; Allen, 56; Hancock, 75; Parker, 18; Bayard, 27. On the 2d ballot Tilden had 508, and was declared nominated; and Thomas A. Hendricks was unanimously nominated for Vice-President. A convention of the Prohibition party met at Cleveland May 16, 1876, and nominated Green Clay Smith, of Kentucky, for President, and G. S. Stewart, of Ohio, for Vice-President. A Greenback convention was held at Indianapolis May 17, which nominated Peter Cooper, of New York, for President, and Newton Booth, of California, for Vice-President. Mr. Booth afterwards declined, and Samuel C. Cary, of Ohio, was substituted.

The national Republican convention of 1880 met at Chicago, June 2. It was a notable gathering of distinguished Republicans. Gen. Grant had just returned from a remarkable journey around the world, and a large portion of the Republican party desired to make him a candidate for a third term. George F. Hoar, of Massachusetts, was selected as temporary chairman, and subsequently made permanent president of the convention. Edwards Pierpont, of New York, reported the platform. After sharp preliminary contests the first ballot was taken on the fifth day of the convention, and stood: Grant, 304; Blaine, 284; Washburne, 31; Edmunds, 34; Windom, 10; John Sherman, 93. The balloting continued for 2 days, and the 36th ballot stood as follows: Grant, 306; Garfield, 399; Blaine, 42; Washburne, 5; Sherman, 3. James A. Garfield, of Ohio, thus had a majority, and Roscoe Conkling, of New York, who had led the Grant forces, made the motion that the nomination be unanimous. Chester A. Arthur, of New York, was then nominated for Vice-President on the 1st ballot, receiving 468 votes. The Democratic convention of 1880 met at Cincinnati on June 22. A considerable number of Democrats believing that Mr. Tilden had been defrauded of the election in 1876 urged his renomination. The 1st ballot taken on the 3d day stood as follows: Winfield S. Hancock, 171; Thomas F. Bayard, 153½; Stephen B. Field, 65; William R. Morrison, 62; Thomas A. Hendricks, 49½; Allen G. Thurman, 68½; Henry B. Payne, 81; Samuel J. Tilden, 38; Thomas Ewing, 10; Horatio Seymour, 8; scattering, 22. On the 4th day the final ballot was taken with this result: Hancock, 705; Hendricks, 30; Tilden, 1; Bayard, 21; and the nomination of Hancock was made unanimous. William H. English was nominated for Vice-President by acclamation. An unsuccessful attempt was made to change the two-thirds rule, which still holds in Democratic conventions. The national Prohibition convention met at Cleveland, on June 17, and nominated Neal Dow for President, and A. H. Thompson for Vice-President. The Greenback party met at Chicago June 11, and nominated James B. Weaver, of Iowa, for President, and B. J. Chambers, of Texas, for Vice-President.

In 1884 the Republican convention met at Chicago on June 3. For the first time the new system of representation by delegates elected in Congressional districts was in force. Government office-holders were excluded from the national committee and from the Presidential electors. The scheme proposing that States and districts should be represented in the convention in proportion to the number of Republican votes cast by them had failed. The 1st ballot stood: Blaine, 334½; Arthur, 278; Edmunds, 93; Logan, 63½; Sherman, 30; Hawley, 13; Lincoln, 4; William T. Sherman, 2. On the 4th ballot James G. Blaine received 541 votes and was declared the nominee for President. No opposition was made to the nomination of John A. Logan for Vice-President. The national Democratic convention also met at Chicago, July 8. On the 3d day the 1st ballot stood: Grover Cleveland, 392; Thomas F. Bayard, 170; Allen G. Thurman, 88; Samuel J. Randall, 78; Joseph McDonald, 56; John G. Carlisle, 27; scattering, 9. On the 4th day Cleveland was nominated by the following vote: Cleveland, 683; Hendricks, 45½; Bayard, 81½; McDonald, 2; Randall, 4; Thurman, 4. Hendricks was nominated for Vice-President without opposition. John P. St. John was nominated for President by the Prohibitionists; and Benjamin F. Butler by the Greenback and Labor parties.

In 1888 the Republicans met in Chicago, June 19. The 1st ballot was taken on June 22 with the following result: John Sherman, 229; Walter Q. Gresham, 107; Chauncey M. Depew, 99; Russell A. Alger, 84; Benjamin Harrison, 79; William B. Allison, 72; James G. Blaine, 33; John J. Ingalls, 28; William Walter Phelps, 25; Jeremiah M. Rusk, 25; Edwin H. Fidler, 24; Joseph R. Hawley, 13; Robert T. Lincoln, 3; William McKinley, Jr., 2. The 8th and final ballot, taken on June 25, resulted as follows: Harrison, 544; Sherman, 118; Alger, 100; Gresham, 59; Blaine, 5; McKinley, 4. Gen. Benjamin Harrison, of Indiana, being thus the choice for President, Levi P. Morton was nominated for Vice-President. At the Democratic convention of 1883, held in St. Louis on June 5, there was no opposition to the renomination of Pres. Cleveland. The convention, without a division, nominated Allen G. Thurman, of Ohio, for Vice-President. Gen. Clinton B. Fisk, of New Jersey, was nominated for the Presidency at the convention of the Prohibition party, and Rev. John A. Brooks, of Missouri, for the Vice-Presidency. There were some minor conventions which also nominated candidates. (F. G. M.)

POLITICAL ECONOMY. While the article in the *ENCYCLOPÆDIA BRITANNICA* gives an excellent sketch of the general history and tendency of the science of Political Economy, the aim of the present article is to give an outline of the labors of Americans in this important field. If the work done in the United States for the development of this science be measured by the number and weight of the systematic treatises, it will appear much less than in England, and perhaps three of the countries on the continent of Europe. But if it be taken into account that in America the discussions of such subjects are represented less by books and pamphlets than by newspapers, articles in periodicals and the debates before the people in the national legislature and in political canvasses, it will be found that in no other country has the science been more sedulously cultivated and more profitably employed than with us. From the very foundation of our national government in 1789 the problems of currency and banking, taxation, immigration, slavery, protection to home industry, and the administration of public debts have formed integral parts in our political discussions, and in later times those of capital in its relation to labor, the administration of charities, and the pretensions of communism and socialism have been ad-

See Vol. XIX. p. 346 (p. 359 Am. Rep.).

ded to the number of themes handled in our great national university.

In colonial times these questions were not much agitated, American ideas being in this field as in others little more than reproductions of those of England. It was the proposal to place the national finances upon a better footing by appointing a supervisor of finance which incited Peletiah Webster to write his *Political Essays* (1781). Similarly it was Lord Sheffield's *American Commerce* (1783) which provoked Tench Coxe to reply in his *Examination* of that audacious book, showing that the colonies had not plunged into commercial ruin by achieving their independence, but had at hand all the elements of industrial prosperity, and were quite able to take care of themselves. After the formation of "a more perfect union" under the Constitution, the duty of chief adviser of the country in economical matters fell upon Alexander Hamilton, the greatest statesman of his age, in Niebuhr's estimation. His *Treasury Report on the Tariff* (1791) and on a national bank (1790), together with his practical administration of our finances, laid the foundation of American policy in these matters. Not that there were no theoretical dissenters from the national policy. The fact that Adam Smith's *Wealth of Nations* was thrice reprinted in the United States, and that Say's treatise appeared here in an early translation, denote the contrary. Two other foreign text-books were the translations of Destutt de Tracy published in 1817, with an introduction by Jefferson, and of Charles Ganihl in 1812.

The agitation over the tariff after the second war with Great Britain produced a shower of pamphlets, of which the most notable are those of Mathew Carey: *Addresses of the Philadelphia Society* (1816); *The New Olive Branch* (1820); *Essays on Political Economy* (1822). The same discussion produced our first attempts at a systematic presentation of the science: Daniel Raymond's *Elements of Political Economy* (1823); Thomas Cooper's *Elements of Political Economy* (1826); *A Summary of the Practical Principles of Political Economy by a Friend of Domestic Industry* (1826); Willard Phillips's *Manual of Political Economy with Particular Reference to the Institutions, Resources, and Condition of the United States* (1828); Friedrich List's *Outlines of American Political Economy* (1827), and Jennison's *Outlines of Political Economy* (1828). All of these are vindications of the protectionist policy, except that of Prof. Cooper, of South Carolina (see COOPER, THOMAS), which repeats the passionate propaganda of Free Trade which he had been conducting on congenial soil in the South. He speaks of manufactures as though they were little else than a blight to the nation. The works of Raymond and Phillips are written with ability and acuteness. That of List, who was a resident of Pennsylvania at that time, foreshadows the principles of his later *Nationalökonomie* (1841).

In the next decade the Protectionists are represented only by Oliver Putnam's *Tracts on Sundry Topics of Political Economy* (1834) and John Rae's *New Principles of Political Economy* (1834). But the work of Rae, by birth a Scotchman, is recognized by Senior and Mill as one of the ablest in the whole field. On the other side we have Prof. Samuel Newman's *Political Economy* (1835), that of Dr. Francis Wayland, of Brown University, first published in 1838 and often reprinted, before its recast by Prof. Chapin (1886); and Henry C. Carey's *Elements of Political Economy* (1837-40). Dr. Wayland's was one of the most superficial books ever written on the subject, but its clear and graceful style gave it the greatest popularity ever enjoyed by any economic text-book in America. Mr. Carey's *Elements* represent his first stage, in which his revolution of the accepted teachings of Political Economy, so far from bringing him into collision with

the *laissez-faire* principle, had made him an earnest asserter of it. On the same side was his friend Condy Raguet, whose treatises *On Currency and Banking* (1839) and *Principles of Free Trade* (1835-1840), together with the three economic periodicals he successively edited, entitle him to remembrance as an acute and forcible writer.

The adoption of the protective tariff of 1842 marks a turning-point in the development of Mr. Carey's ideas. Neither then nor afterwards did he abandon those convictions which arrayed him against the "dismal science" of the English economists. He remained a conditional optimist in his belief that "Men pass from what is worse to what is better in land, in labor, and in food." He still asserted that the economic laws were designed to secure a constantly increasing return for human labor in subduing nature, and thus reducing values, and to effect a more equal distribution between capitalist and workman, between landlord and tenant. He still contended that where the misery of the savage is found within the scope of civilization, somebody is to blame. But the effects of the nation's return to the protective policy satisfied him, after some years of reflection and further study, that he had underestimated the power of the wealthier and more advanced countries to check the growth of economic association in others, and to secure to themselves what English economists taught were the more remunerative industries. After several years of silence he announced his new conclusions in *The Past, the Present and the Future* (1848) and in *The Harmony of the Interests* (1850). In the meantime four other authors had announced the same inferences from our economic experience: A Southern Planter in *Notes on Political Economy as applicable to the United States* (1844); Ezra C. Seeman in his *Progress of Nations* (1846-68); Rev. Calvin Colton, the friend and biographer of Henry Clay, in his *Public Economy for the United States* (1848); and Willard Phillips in his *Propositions Concerning Protection and Free Trade* (1850), a searching examination of Adam Smith's principles. On the other side the most notable publication was the *Treasury Report* of Mr. Robert J. Walker in 1846, which may be said to have been answered by that of Mr. William M. Meredith in 1849.

The decade before the civil war was taken up with the discussion of Slavery, and it is notable that its moderate opponents, such as Dr. Channing, pressed the consideration that it was an economic mistake, as has been proven since the war. On the Free Trade side at this time there appeared a short systematic treatise by George Opdyke, of New York, in 1851, which aims at a new treatment of the subject, but made little impression: *Political Economy for the People* (1859) by the veteran George Tucker, of Virginia, who in 1837, 1839, and 1857 had published works on the currency; and *The Science of Wealth, a Manual of Political Economy*, by Amasa Walker, a practical banker, who also was lecturer on the subject in Amherst College. It was by far the ablest of the orthodox treatises which had appeared in this country, and reached its fifth edition after its author's death. On the protectionist side are *Principles of Political Economy* (1835) by E. Peshine Smith, a disciple of Carey, but with a good deal of originality of his own; Prof. Francis Bowen's *Principles of Political Economy* (1854); the translation of Friedrich List's *National Economy* (1858), with an elaborate historical and critical "Introduction" by Stephen Colwell, whose own book on the currency problem, *The Ways and Means of Payment* (1859), never has been surpassed either in historical learning or wealth of practical suggestion. Above all Henry C. Carey in 1858-59 published his own system in definitive shape in his *System of Social Science*, which has been translated into more languages than any other economic work except perhaps those of Adam Smith and J. Stuart Mill.

The next decade (1860-70) saw few books on the

general subject, although the great monetary discussions raised by our fiscal policy during the war had already begun. In 1864 Prof. Bowen published *Political Economy Applied to the Conditions and Institutions of the American People*, in which hard money and moderate advocacy of Protection are leading features. Prof. A. L. Perry published in 1866 his *Elements of Political Economy*, following Carey and Bastiat in his conception of value, but advocating the *laissez faire* theory without reservation. In 1869 Horace Greeley, the veteran editor, collected into a book his *Essays to Elucidate the Science of Political Economy*, chiefly occupied with the tariff and coöperation. Mr. Andrew W. Young in 1866 published under the title *National Economy* an historical account of the great debates on the tariff question in this country. In 1870 Dr. William Elder gave the public a popular exposition of Mr. Carey's leading doctrines in *Questions of the Day*.

The next decade (1871-80) witnesses the division of the economists who look to Europe for light and leading into two schools. The new Historical School founded by Roscher in Germany began to find disciples in America. Prof. Francis Walker, a son of Amasa Walker, published *The Wages Question* (1876), *Money* (1878), *Money, Trade and Industry* (1879), in which the new views of labor and the functions of government are presented, and bimetallism is defended. Since that time the new school has grown rapidly, and now much more than outnumbers its orthodox rival in the leading universities of the country. On the other side Prof. William G. Sumner, of Yale, represents the old method and the old doctrines of English Political Economy with an energy peculiar to himself, in his *History of American Currency* (1874), his *Lectures on the History of Protection in the United States* (1877), and other works. On the protectionist side are Prof. R. E. Thompson, who in his *Social Science and National Economy* (1875), revised under the title *Elements of Political Economy* (1882), seeks to combine the views of List with those of Carey; Prof. Bowen's *American Political Economy* (1877); Orin Skinner's *Issues of American Politics* (1873); Prof. Albert S. Bolles's *Chapters in Political Economy* (1874) and his *Financial History of the United States* (3 vols., 1879-83), besides pamphlets by John L. Hayes, George Basil Dixwell, Cyrus Elder, and David H. Mason.

The resumption of specie payments in 1879 may be said to have disposed of that controversy, only to leave the country leisure for a prolonged discussion first of the Silver question, and then of the question of Free Trade vs. Protection. In the former controversy the case for remonetization has been ably maintained by Mr. S. Dana Horton in *The Silver Pound* (1887) and other works, by Mr. Balche as an American interpreter of the ideas of Cernuschi, by Prof. Francis A. Walker, Hon. Wm. D. Kelley, and many others; and the Report of the Congressional Commission on the question is of permanent value. On the other side were Prof. Sumner, Prof. J. L. Laughlin, of Harvard, in his *History of Bimetallism in the United States* (1886), and the orthodox economists generally. In that on Protection Prof. Sumner has been the foremost champion of Free Trade, as is shown in his *Economic Problems* (1884), and *Protectionism* (1885). Next to him comes Mr. Henry George, whose very readable *Protection and Free Trade* is marred by readiness to catch at any loose statement made by an opponent, and by extremism. It advocates the entire abolition of custom-houses and the substitution of a single tax on land for all others. Mr. David A. Wells, Mr. J. S. Schoenhof, Prof. F. W. Taussig in his *History of the Tariff* (1888), and others have been earnest fighters on that line, and Prof. R. T. Ely has advocated Free Trade in his *Problems of To-day* (1888) from the standpoint of the new school which rejects the *laissez faire* premise of that policy. On the other side are Mr. Giles B. Hawley's *Capital and Population* (1882); Mr.

Ellis D. Roberts's *Government Revenue* (1884); Prof. Robert Ellis Thompson's *Harvard Lectures on Free Trade and Protection* (1885); Mr. Robert P. Porter's *Breadwinners Abroad* (1885); Hon. Henry M. Hoyt's *Protection versus Free Trade* (1886); Mr. Giles B. Stebbins's *Protectionist's Manual* (1883); Mr. Richard W. Thompson's *History of Protective Tariff Laws* (1888); Mr. Henry V. Poor's *Twenty-two Years of Protection* (1888); and Mr. David H. Mason's *Short Tariff History of the United States*, Part I. (1884), besides pamphlets by John Welsh, Joseph Wharton, Horace Castle, John F. Scanlon, Henry Hall, Thomas H. Dudley, and many others. Arguments from both sides will be found in Mr. H. W. Furber's *Protection and Free Trade, Both Sides* (1888) and in Dr. Albert Shaw's *The National Revenues: a Collection of Papers by American Economists* (1888).

Parallel with these two controversies, and at times running into the second, has been the discussion of the relations of rich and poor, wage-earners and wage-payers, which has come to be recognized as an economic problem since the discredit of the wage-fund theory by Thornton and Mill. In America the condition of labor has been a matter of public concern ever since the rise of the factory system and the consequent formation of a class who live by wages outside of personal relations to their employers of any intimate sort. Mr. George's theories of land nationalization and the single tax, set forth in his *Progress and Poverty* (1879) and *Social Problems* (1884), have given a notable impulse to the discussion. Mr. Wm. G. Moody in *Land and Labor in the United States* contends that machinery has made the reduction of the hours of labor to six imperative, if we are to find work for our people. Mr. George Gunton in *Wealth and Progress* (1887) maintains that the rate of wages is fixed by the standard of living, that this can be raised only by increasing the social opportunities of the laboring classes, and that the readiest means to this is a reduction of the daily hours of labor. Mr. Laur. Gronlund in *The Coöperative Commonwealth* (1884) contends for the entire overthrow of the competitive system and the absorption of all productive energies by the state. These are specimens of the teachings which are stirring the laboring population of all Christendom like a ferment. The only notable attempt to assert the old economic indifference to them is in Prof. Sumner's *What Social Classes Owe to Each other*. (1883). Genuinely radical is the demonstration offered by Mr. Edward Atkinson of the truth of the law of equalizing distribution first formulated by H. C. Carey, which he presents in *The Distribution of Products* (1885) and *The Margin of Profits* (1887). Mr. Wm. B. Weedon in *The Social Law of Labor* brings the light of general sociological development to bear on the problem. It is taken up in the light of Christian principle in Rev. Washington Gladden's *Working People and their Employers* (1885); in Dr. T. Edwin Brown's *Studies in Socialism* (1886); and in Prof. Richard T. Ely's admirable book, *The Labor Movement in America* (1886).

Of systematic treatises in this period there are Simon Newcomb's *Political Economy* (1887) and Prof. J. L. Laughlin's *The Elements of Political Economy* (1887), which belong to the orthodox school, as does the latter's abridgment of Mill (1884) with valuable additions; also translations of Roscher and Laveleye and Prof. F. A. Walker's *Political Economy* (1883), which represent the new Historical School; as does Dr. Simon N. Patten's *Premises of Political Economy* (1884). On the Protectionist side, to which Dr. Patten also belongs, there are Dr. Steele's *Lessons in Political Economy* prepared for the Chautauqua students, and Dr. Van Buren Denslow's *Principles of Economic Philosophy of Society, Government and Industry* (1888).

A marked feature of the decade has been the enlargement of the facilities for economic study in the leading universities of the country—Harvard, Yale,

Columbia, Pennsylvania, Johns Hopkins, Cornell, and Michigan. With this has come the formation of organizations to bring together the teachers of the science, the Political Economy Club representing orthodoxy more or less, and the American Economic Association the new tendencies. Finally, at Harvard, Columbia, Pennsylvania, and Johns-Hopkins there are series of publications, in which economic and related questions are treated. (R. E. T.)

POLK, LEONIDAS (1806-1864), bishop and general, was born at Raleigh, N. C., in 1806. He graduated at West Point in 1827 and entered the artillery, but soon resigned. After a course of theological study he was ordained to the Episcopal ministry in 1831, and was made missionary bishop of Arkansas and the Indian Territory in 1838. He took charge also of the adjoining diocese until 1841, when he was made bishop of Louisiana. After twenty years' service in this capacity he accepted the appointment of major-general in the Confederate army. He took command at Columbus, Tenn., and unsuccessfully endeavored to obstruct the passage of the Mississippi to Union forces. When Gen. Grant captured a Confederate camp at Belmont Polk crossed from Columbus, but did not prevent the accomplishment of Grant's object. He afterwards had command of a division and fought at Stone River, Chattanooga, and Chickamauga. He was killed while reconnoitring near Marietta, Ga., June 14, 1864.

POLLOCK, FREDERICK, English lawyer and essayist, was born in London, Dec. 10, 1845. He is a grandson of Sir Frederick Pollock (1783-1870), who was chief baron of the exchequer. He was educated at Eton and Trinity College, Cambridge, of which he became a fellow in 1868. He was called to the bar at Lincoln's Inn in 1871, and in 1882 was made professor of jurisprudence at University College, London, in 1883 corpus professor of jurisprudence at Oxford, and in 1884 professor of common law. He is also editor of the *Law Quarterly Review*, and has contributed to various periodicals. Among his legal works are *Principles of Contract* (1875); *Digest of the Law of Partnership* (1877); *The Land Laws* (1883). To other departments belong *Spinoza, his Life and Philosophy* (1880), and *Essays in Jurisprudence and Ethics* (1882). His brother, **WALTER HERRIES POLLOCK**, was born in 1850, educated at Eton and at Trinity College, Cambridge, graduating in 1871, and was called to the bar at Inner Temple in 1874. He has delivered many lectures on historical and literary subjects, and in 1884 became editor of *Saturday Review*, with which he had long been connected. His publications include *Lectures on the French Poets; Songs and Rhymes, English and French; Verses of Two Tongues; and The Poet and the Muse*.

POLYGAMY (Gr. *πολλός*, many, and *γάμος*, marriage) means multiple marriage, i. e., the condition of a man having two or more wives, or of a woman having two or more husbands at the same time. Recent writers on sociology have distinguished these two kinds of polygamy by different names, calling the former "polygyny" (many wives), and the latter "polyandry" (many husbands). Opposed to polygamy is that form of the marriage relation called "monogamy" (single marriage), by which one man is forbidden to have more than one wife, or one woman to have more than one husband at the same time. Although from a scientific point of view this terminology is both convenient and accurate, yet it is not in accordance with popular usage. As commonly employed the word "polygamy" designates exclusively that form of the marriage relation in which one man has several wives at the same time, and it is in this sense that we shall use it in the present article. Polyandry, the condition of a woman having several husbands, though much more extended than is commonly supposed, many intelligent persons being ignorant of its existence in any part of the world, is comparatively limited and excep-

tional. It exists among the aboriginal inhabitants of the island of Ceylon and in Thibet. In both these countries, however, it is usually restricted to the case where all the husbands of one wife are brothers or half-brothers. Among other barbarous tribes where it is said to exist, as the Fuegians, the Aleutians, many of the Pacific islanders and some of the native tribes of Hindustan, polygamy also exists, and the two form a system hardly distinguishable from promiscuous intercourse. Polygamy, in the sense of one man having several wives, is far more frequent and widely extended. It exists in every latitude and every climate, in Asia, in nearly the whole of Africa, in Australia and most of the islands of the Pacific, and on the western continent and the adjacent islands among the aboriginal tribes from the Esquimaux and Aleutian islanders in the extreme north to the Patagonians and Fuegians in the extreme south. It has existed from the remotest periods of antiquity, and traces of it are to be found in the history of almost every race. Nor has polygamy been confined to barbarous nations. The Egyptians, Hebrews, and Persians were among the most civilized peoples of ancient times, and in the middle ages the Moors of Spain were at one time the foremost nation in Europe in literature, science, and art; yet polygamy was practised among them all. Taking into consideration all nations, past and present, barbarous and civilized, it cannot be doubted that the peoples among whom polygamy has been and is allowed far exceed in numbers those among whom it has been and is prohibited.

The only widely extended religion by which polygamy is at the present time expressly sanctioned is the Mohammedan. Even by that the number of wives a man may lawfully marry is limited to four (see Koran, cap. 4), but in practice the number is only limited by his wealth and his inclination. The Mohammedan religion has, during the present century, extended itself greatly among the barbarous tribes of Africa. This, however, has not really extended polygamy, as that custom prevailed among those tribes previous to the introduction of Mohammedanism. The fact that Mohammedanism sanctions polygamy has greatly facilitated the spread of that religion among the barbarous tribes where the custom already existed. In all Christian nations (which is equivalent to saying in all the most highly civilized nations) polygamy is regarded as a sin, and is prohibited by law as a crime.

Old as polygamy is historically and widely extended as it is geographically, a closer examination shows that practically this extension is more apparent than real. Inhabitants of highly civilized countries who have never given the subject any special examination, when they hear or read about a country in which polygamy is allowed, are apt to imagine that in such a country every married man has three or four wives. This has also been frequently asserted by travellers. Such statements necessarily imply either that the adult female population is three or four times greater than the male, or that only a small fraction of the male population have any wives at all unless polyandry exists at the same time. Excluding this latter case, which is of limited extent, there is no evidence that either of the above conditions has ever existed for any great length of time in any community of any considerable size. It is fully established that among all races of mankind the number of male infants born slightly exceeds the number of female, the ratio being about twenty-one males to twenty females. From physiological causes, into the nature of which it is not necessary to enter here, the number of deaths among male infants slightly exceeds that among female. After arriving at adult age the occupations of men, even in the most civilized and peaceable communities, expose them to death by accident more frequently than women. On the other hand the female sex is alone exposed to the accidents and perils of child-bearing. Taking the human race as a whole the numbers of married and

marriageable men and women are practically equal. What is true of the race is, in the great majority of cases, true of any particular community or nation. Exceptional causes sometimes interfere with this equilibrium of the sexes. Neighboring tribes of savages constantly engaged in war with each other sometimes show a great preponderance of the female population, owing to the number of men slain in war. Such cases are mostly confined to the lowest type of savages. It is quite certain that no considerable portion of the human race has ever been in such a condition that a majority of the men could each have as many as two wives. Hence, even among barbarians, the practice of polygamy is usually confined to a small minority of the males.

Among highly civilized nations economic tendencies sometimes temporarily disturb the equilibrium of the sexes in particular localities. Thus, when gold was discovered in California there was a great rush of the male population of other countries to that territory. The same thing happened afterwards in the case of Australia.

Although the preponderance of the male population in those countries was for a time very great, yet its ratio to the population of the countries whence it came was so small that it had upon them no perceptible effect. In the United States there is a constant emigration of young unmarried men from the Eastern to the Western States. This tends to produce an excess of males in the West and of females in the East. But the means of rapid and cheap transit have so greatly increased during the last half century, the opportunities for self-support afforded to the female sex have been so multiplied, and the tendency of both sexes not to enter the marriage state until they have a reasonable prospect of being able to rear a family in a social condition at least equal to their own has so much increased, that they have more than counterbalanced any effects of the slight inequality of the sexes thus produced. Even in a community when from some cause the female population had become so great in comparison with the male as to render it possible for each man to have three or four wives, unless that cause were constant in its operation, natural laws would in a few generations bring about an equality of the sexes, and polygamy, though tolerated by law and custom, would inevitably be confined to a small minority of the male population.

Another circumstance tends to restrict the practice of polygamy. Where a people is so far advanced in civilization as to have a permanent abiding place and to depend for support principally upon its industry, each one of the great majority of the male population finds the support of one wife and her children all that he is able to achieve, and thus polygamy can only be practised by the wealthy and powerful, who necessarily constitute a small minority. Hence though polygamy was allowed by the Gauls, Germans, and other barbarous races from which the modern nations of Europe are in great part descended, yet practically it was confined to the chiefs, and as a rule among the mass of the people each man had but one wife.

During the flourishing periods of the Greeks and Romans no man among them could have more than one legitimate wife at the same time. As fast as the barbarous nations that overthrew the Roman empire were converted to Christianity the last remnants of polygamy were blotted out.

In its effects on the family nothing can be said in favor of polygamy except in comparison with those lower conditions of mankind where the domestic relations can hardly be said to exist. When it exists among barbarous tribes the husband regards his wives as so much property and treats them as slaves. The women are compelled to do all the labor, and hence they do not object to an increase in the number of wives, thinking that by this means the amount of work which each will have to perform will be lessened. In

more civilized countries, where polygamy is confined to the rich and the powerful, the number of a man's wives is looked upon as an index of his rank, and the women are hence led to regard it with favor as an indication of their own higher position. Travellers in countries where polygamy is allowed are unanimous in their testimony that the mutual respect and affection of husband and wife, which in countries where monogamy is only permitted is regarded as constituting the highest ornament of the ideal family, is almost unknown. The husband regards his wives merely as the instruments of his pleasures, and considers himself as having discharged his whole duty to them when he has provided for their physical comfort; and the wives look upon the husband simply as a master from whom they must get all they can by artifice but can demand nothing as a right.

The effect upon the children is in the highest degree deleterious. Where there are groups of children by different wives either the paternal care and authority is dissipated among so many as to be of little account or it is concentrated upon some of the children to the neglect of the others. The rivalries, jealousies, and contentions of the wives are shared by the children and hatred rather than love is fostered. Hence in those countries where polygamy is practised by the rulers the old age of a monarch is a season of plotting and conspiracy, and his death is the signal for revolution and bloodshed.

A general review of the past history and present condition of the human race leads irresistibly to the following conclusions: 1st. In the vast majority of communities of any considerable size the number of married and marriageable men is substantially equal to the number of married and marriageable women. 2d. Whenever from any cause this equality is destroyed the natural laws which govern the reproduction of the human race will, if the cause ceases to operate, restore the equality. 3d. Except where the male population of a community is constantly reduced by continual warfare the practice of polygamy by a majority of the males becomes a physical impossibility, unless wives are obtained by capture or purchase from some other community, and this state of things is confined almost entirely to the lowest grades of humanity. Where polygamy exists in semi-civilized nations the number of women obtained by capture or purchase bears but a small ratio to the whole population, and such women are most frequently regarded as slaves and concubines, not as wives having equal rights with those legitimately married. 4th. Wherever polygamy has co-existed with a high state of civilization it has been confined to the wealthy and powerful, who are necessarily a small minority, and in such cases it has always been a survival from a previous state of barbarism. 5th. Natural laws, the progress of science and the industrial arts, and the spread of Christianity all tend with irresistible force to its final extirpation.

In modern times the attempt of the Mormons to revive polygamy within the limits of a Christian nation is the only one of such extent and importance as to demand attention.

In regard to this only a few words are necessary in addition to what will be found under MORMONS. When (1847) the members of this sect, after their expulsion from Illinois and Missouri, selected as their abiding place the region south of the Great Salt Lake, they were separated on all sides by a vast extent of unsettled country from all contact with civilization. They undoubtedly expected that many years, probably two or three generations, would pass before they would be interfered with by the advancing tide of emigration from the East. When in 1850 they were organized into a Territory, Brigham Young was appointed governor, the other territorial offices were filled by members of their own sect, and the delegate elected by themselves was admitted to Congress, these expectations were strengthened. They hoped in a few years

to become sufficiently numerous to demand admission as a State. That object accomplished, polygamy, already established by custom, would immediately be sanctioned by law. All these calculations proved mistaken. The construction of the Pacific Railroad made communication on the east and the west rapid and easy, and they became exposed not only to transient observers but to the influx of a population protected by the force of the government and regarding the system of polygamy with loathing and disgust. Their polygamous delegate was expelled from Congress. The territorial offices were filled by men opposed to the institution. Finally polygamy was declared to be a crime, and those who practised it were deprived of the elective franchise and subjected to heavy penalties. Of course many difficulties have been met with in enforcing these laws, but there can be no doubt about the final result. Already dissensions on this point are springing up among the Mormons themselves. It is reported that a large portion of those who are determined to maintain the institution of polygamy have purchased a tract of country in the northern part of Mexico and are about to remove thither. Those who remain where they now are will undoubtedly gradually abandon the practice. So long as Utah remains a Territory the authority of the government of the United States is absolute, and it is entirely certain that Utah will never be admitted into the Union as a State except under guarantees that will ensure the final extinction of an institution so opposed to the moral and religious convictions of the nation at large. (W. M. F.)

POLYTECHNIC SCHOOLS (derived from the Greek *πολις*, many, and *τέχνη*, art) are educational institutions intended for instruction in the practical applications of mathematics, physics, and chemistry. The first school bearing this name was founded in Paris in 1794 by the National Convention for the recruiting of the public service. In this the most eminent French scientists were instructors, and the pupils received an annual stipend from the government. The Emperor Napoleon afterwards required the pupils to pay their own expenses and gave the school a military organization, which it has since retained. Many of the most distinguished French scientists and mathematicians have been graduates of this institution.

Similar institutions have been founded in the United States by private enterprise, while the larger colleges and universities have formed their scientific departments on its model. The oldest of these institutions, the Rensselaer Polytechnic Institute of Troy, N. Y., was founded in 1824; and in the same year the Franklin Institute was organized in Philadelphia. These institutions are still in existence and have done much excellent work. From time to time other technical schools were founded, so that by 1848 the Ohio Mechanics' Institute was in existence and scientific departments had been added to Yale and Harvard Colleges and to the University of Virginia.

In 1829 the highly useful Central School of Arts and Manufactures was founded in Paris, while the School of Design from which has grown the school system of science and arts of Great Britain came into operation in 1837. A department of science and arts was formally added to the school system of Great Britain in 1856. The American movement in this direction was made national in 1862 by a congressional land-grant to the several States for the support of schools of scientific and industrial education. This action of the government has given rise to a considerable number of such State schools, some of which are in a flourishing condition, and excellently equipped with books and scientific material, though in others the progress has been far from satisfactory. In addition to these endowed schools a considerable list might be made of unendowed polytechnic institutions, in many of which the instruction is of the most thorough character and the equipment and professional ability equal to that of similar institutions in Europe.

The scientific schools of America, indeed, have elicited favorable comment from foreign authorities. Dr. Kerr, a Senior Inspector of the Schools of Great Britain, remarked in 1883 that America had (at St. Louis) the finest scientific school in the world. Mr. Mather, another high authority, says of the technical schools of the United States: "I am of opinion that there is nothing better of the kind in Europe. The advantage of the training in these is its practicalness."

Yet the schools founded by the land-grant of 1862 have not, as a rule, realized the expectations entertained of their work. Complaint is made that their instruction is too theoretical, that many of them suffer from a lack of scientific equipment, and that instruction in agriculture and the arts has languished through various causes. These difficulties are gradually being removed; several of these schools are equipped for thorough instruction in pure and applied science, while progress in this direction is being made in them all. Of the endowed schools several, such as the Columbia School of Mines, the scientific department of Harvard, of the Johns-Hopkins institution, of the University of Pennsylvania, and of several similar institutions, with other schools solely devoted to polytechnic instruction, have attained a high standing as schools of practical science, and compete successfully with the most famous scientific schools of Europe.

The following table taken from the report of the Commissioner of Education, gives the statistical position of these schools in the United States in 1886. The statistics of schools of science endowed with the national land-grant are given in the column under "With National Grant" and the statistics of other polytechnic schools under the head "Without."

	With National Grant.	Without.
Schools,	48	42
Instructors,	527	447
Students,	5882	4263
Books in libraries,	100,266	138,713
Value of grounds, buildings, etc.,	\$5,182,455	\$2,004,426
Income from funds,	405,507	129,895
Income from tuition fees,	174,099	74,558
Income from State appropriations,	383,390	444,305
Total income,	\$962,996	\$648,758

In recent years a system of technical instruction of a less advanced grade has been established in several States, and is meeting with highly encouraging success. The experiment of combining manual work with education is now going on in many of our cities, and the idea is spreading with great rapidity. The Manual Training School as a practical institution originated in 1868, in the Imperial Technical School of Moscow, Russia. It was not till 1876 that the world became generally aware of the excellent work that Russia was doing in this direction. In that year a display of the work of the Moscow school made at the Centennial Exposition, Philadelphia, attracted the attention of educators generally. The first to accept the new idea practically was Dr. John D. Runkle, of the Massachusetts Institute of Technology, who immediately recommended the adoption of the Russian system, and added to the Institute a department of mechanic arts. In 1877 the Washington University of St. Louis experimented in the same direction, and gained a fully endowed manual training department by 1879.

Since that time manual training departments have been added to several of the State agricultural colleges, to Girard College, Philadelphia, and to other institutions, while manual training has been made a part of the public school system in Boston, Baltimore, San Francisco, Philadelphia, Washington, and several other cities. One of the most notable of the earlier schools of this character is the Workingmen's School and Free Kindergarten, established by Felix Adler in connection with the Society for Ethical Culture of New York. The purpose of this school is to connect general training in industrial principles with moral and

educational training. The work of the manual training schools gives high satisfaction wherever instituted, and the training of the hand and the mind together promises to become in the future an essential feature of educational systems. It is now clearly perceived that the training of the hand does not detract from intellectual education, but rather brightens than dulls the wits, while the instruction of girls in sewing, cooking, and the like, and of boys in the use of tools and in the general principles of the mechanical arts, cannot but be productive of good results, in fitting the growing generation to be practically self-supporting members of the community. The time required for manual training will detract but little from that requisite for mental training, and will be particularly well applied in the case of that large percentage of the school population who lack capacity for advanced intellectual education. (See also DESIGN, SCHOOLS OF.) (C. M.)

POMEROY, a city of Ohio, county-seat of Meigs co., is on the Ohio River, 66 miles below Parkersburg, and is enclosed landward by precipitous hills. It has 2 national banks, 9 churches, a high-school, and a weekly newspaper. Its chief industries are coal-mining and salt manufacture. There are also iron-foundries, flour-mills, and a woollen-factory. The city was incorporated in 1868 and the population in 1880 was 5560, having decreased since 1870.

POMEROY, JOHN NORTON (1828–1885), legal writer, was born at Rochester, N. Y., April 12, 1828. He graduated at Hamilton College in 1847, was admitted to the bar at Rochester in 1851, and practised there for some years. In 1864 he was made professor of law in the University of New York, but in 1869 returned to the practice of his profession at Rochester. He was also active as a contributor to legal and political periodicals. In 1878 he was made professor of law in the University of California. He died at San Francisco, Feb. 15, 1885. He published an *Introduction to Municipal Law* (1865); *Introduction to Constitutional Law* (1868); *Remedies and Remedial Rights* (1876); *Equity Jurisprudence* (1883); and *Riparian Rights* (1884).

POMEROY, SETH (1705–1777), soldier, was born at Northampton, Mass., in 1705. He served in the expedition against Lewisburg in 1745 with the rank of major. In September, 1755, he succeeded to the command of a regiment in the battle of Lake George. He was a delegate to the provincial congress of Massachusetts in 1774 and was appointed by it a brigadier-general in 1775. He ventured into the fight at Bunker Hill as a volunteer and was conspicuous for his bravery. The Continental Congress had appointed him senior brigadier, but finding his competency questioned he retired from the camp without receiving the commission. In the autumn of 1776 he led a body of militia to the aid of Washington on the Hudson. He died at Peekskill, N. Y., in the following February.

PONCAS, a tribe of American Indians of the Dakota family, were found by Lewis and Clarke in 1803 dwelling on the Ponca River, west of the Missouri. They had formerly dwelt on a branch of the Red River of the North, but had been driven out by the Sioux, who are of the same family. Their numbers were then stated at 200, but this is evidently too small, for in a census made by Gen. Porter in 1829 they were set down at 600. Their first treaty with the U. S. government was in 1817, and another was made in 1825. No further notice was taken of them for thirty years. In 1858, after having been harassed by the Sioux and the whites, they sold most of their lands to the government, and were promised aid in cultivating a reservation on the Niobrara River. The buffalo, which had once been their chief food, was now driven to a distance, and they depended almost entirely on agriculture. Being without arms they were not able to protect themselves against those who took advantage of their feeble condition. They remained loyal and peaceable throughout the civil war, though the

soldiers at times committed outrages and the government did not give them aid or protection. By a new treaty in 1865 their reservation was extended, and promise was made of indemnity for their losses. Under Pres. Grant's administration they were assigned to the care of the Protestant Episcopal Church. A chapel was built and three schools established, and they seemed for a short time to prosper. Then a flood in the Missouri in 1873 caused great damage, their crops were destroyed by drought and locusts, and they were reduced to a deplorable condition. In 1876 efforts were made to remove them to Indian Territory. Their chiefs who had gone to look at the new land returned dissatisfied. But the work of removal went on. The tribe was conducted by troops, and suffered greatly on the road. In a few months one-third of their number had died. In 1877 Standing Bear, a chief, with thirty others, returned to Kansas and sought refuge among the Omahas. They were seized and imprisoned. But this act caused great excitement in Omaha, and T. H. Tibbles, editor of a newspaper, sought their release in the U. S. Court by *habeas corpus*. Judge Dundy gave a decision in favor of the Indians, allowing them to go where they pleased. Roused by this revelation of their rights under the law they soon sought to obtain restoration of their original lands in Dakota, which had been given to the Sioux. An agitation in their behalf sprang up throughout the country. In the meantime Standing Bear and others settled on an island in the Niobrara River, and soon 130 Poncas were gathered around him. Assisted by friends in Omaha they set to work industriously in improving the soil. In 1887 they were reported as numbering 210, and, receiving instruction from a missionary of the American Missionary Association, about 40 wear citizens' dress. Over 400 Poncas remained in Indian Territory and received aid from the government. They have a reservation of 101,894 acres about 30 miles south of the Kansas line. In 1887 their number was reported as 528, which was a decrease of 23 from that of the previous year. Through the influence of their chiefs they stubbornly resist attempts to civilize them, but have been prevailed upon to forego the annual sun-dance. About 100 wear citizens' dress wholly or in part. The agency school had an average attendance of 77. In 1884 the issue of rations to them was discontinued, but in 1887 a failure of crops caused it to be renewed.

PONCE DE LEON (1460–1521), the discoverer of Florida, was born in Leon, Spain, about 1460. After displaying great bravery in the wars with the Moors of Granada, he was attracted by the discovery of the New World, and in 1493 joined the second expedition of Columbus. He was placed in command of the eastern province of Hispaniola and thence conducted successful expeditions against Porto Rico. He finally subdued this island in 1509 and became its governor, but the family of Columbus caused his removal from the post. Having amassed great wealth he immediately organized an expedition for the discovery of a "Fountain of Youth," of which reports were current among the natives. On March 3, 1513, he sailed from Porto Rico with three ships and cruised among the Bahamas. On March 27, being Easter Sunday, called by the Spaniards *Pascua Florida*, he sighted land, which he named Florida. On account of bad weather he did not go on shore until April 9, when, near the mouth of the River St. John, he formally took possession in the name of the King of Spain. He cruised southward along the coast and among the Tortugas, and then returned to Porto Rico. On reporting his discovery in Spain he was made governor of Florida, and in 1521 he attempted to effect its colonization, but he was repulsed and wounded by the natives and withdrew to Cuba, where he soon died of the effects of his wound.

POND, ENOCH (1791–1882), Congregationalist minister, was born at Wrentham, Mass., July 29, 1791. He graduated at Brown University in 1813, and studied

theology with Rev. Dr. Emmons. He was ordained pastor of the Congregational Church, Auburn, Mass., in 1815, and in 1828 became editor of *The Spirit of the Pilgrims*, a monthly founded at Boston to uphold Orthodox theology against the Unitarian movement. In 1832 he was made professor of theology in the seminary at Bangor, and here he remained until his death. In 1856 he had been made president of the seminary and professor of ecclesiastical history, but at the age of eighty was made professor emeritus. He published *Lives of President Samuel Davies* (1827), Count Zinzendorf (1839), John Wickliffe (1841), the Mather Family (1844), Sir William Phipps (1847), John Knox (1856). His other works include *Plato* (1846); *The Ancient Church* (1851); *Sicidenborgianism Examined* (1861); *Pastoral Theology* (1866); *Christian Theology* (1868); *History of God's Church* (1871).

PONTE, LORENZO DA (1749-1838), an Italian poet, was born at Ceneda, Venice, March 10, 1749. He was professor of rhetoric, but was banished from Venice on account of his liberal opinions and especially a satirical poem. He then became Latin secretary to Emperor Joseph II., and wrote the librettos of several operas, among which were *Don Giovanni* and the *Marriage of Figaro*. He went to London as secretary of an opera company, and in 1805 removed to New York. Here he gave instruction in Italian, and at the age of eighty was made professor of that language in Columbia College. He published an autobiography (New York, 1823), and died Aug. 17, 1838. His son, Lorenzo L. Da Ponte (1805-1840), was professor in the University of the City of New York, and published a *History of the Florentine Republic* (1833).

PONTIAC (d. 1769), a noted Indian warrior, belonged to the Ottawa tribe, and was born about 1710. His first exploit after becoming principal chief of his tribe was the defence of Detroit on behalf of the French in 1746. He is also said to have led his warriors at Braddock's defeat in 1755. His hatred of the English increased after they had come into possession of Canada, and he proceeded to organize a conspiracy among the Indian tribes to exterminate the colonists. The month of May, 1763, was appointed for a universal attack on the settlements. In nine cases the attacks were successful, but at Detroit, where Pontiac led in person, the settlers were forewarned. He then conducted a regular siege for five months, and meantime sought aid from the French in Louisiana. He also obtained food for the besiegers by issuing a kind of notes on birch-bark, signed with the figure of an otter. Though the siege was raised Oct. 12, he faithfully redeemed the notes. But he was unable to retain his followers and eventually himself submitted to the English in 1766. In his later years he was intemperate, and he was killed by an Indian at Cahokia, opposite St. Louis, in 1769. The best history is F. Parkman's *Conspiracy of Pontiac* (1851). F. B. Hough edited a *Diary of the Siege of Detroit* (1860).

POOLE, STANLEY LANE, English author and Orientalist, was born in London Dec. 18, 1854. He is a grandnephew of E. W. Lane, the noted Orientalist, by whom he was partly educated. He then proceeded to Corpus Christi College, Oxford, whence he graduated in 1878. He had already given attention to numismatics under his uncle's direction, and in 1874 he was appointed by the trustees of the British Museum to write the official *Catalogue of Oriental Coins* (8 vols., 1875-83). To this was added a *Catalogue of Indian Coins* (2 vols., 1885). He also completed his great-uncle's *Arabic Lexicon*, editing the sixth and seventh volumes (1877-85), and published a *Life of E. W. Lane* (1877). As the result of a mission to Egypt in 1883 he published *Art of the Saracens* (1886), and has since visited Russia in numismatic investigation. He contributed many articles to the ninth edition of the *Encyclopædia Britannica*, to the *Dictionary of National Biography*, and various periodicals. Among his works are *Essays in Oriental Numismatics* (2 series, 1872-77);

Egypt (1881); *Speeches and Table-Talk of Mohammed* (1882); *Social Life in Egypt* (1883); *Life of Gen. F. R. Chesney* (1885); *Coins and Medals* (1885); *History of the Moors in Spain* (1886).

His uncle, REGINALD STUART POOLE, born in London Feb. 27, 1832, is also distinguished as an Egyptologist and numismatist. He has been connected with the British Museum since 1852, holding the positions of assistant in the department of antiquities, assistant keeper of coins and medals (1861), and keeper (1870). He has edited *Official Catalogue of Greek, Roman, Oriental, and English Coins* (19 vols., 1873-85). He has also published *Horæ Egyptiacæ* (1851); *Cities of Egypt* (1882); *Coins of the Ptolemies* (1883); *Coins of the Shaks of Persia* (1886). He has contributed to the *Encyclopædia Britannica* and to periodicals.

POOR, ENOCH (1736-1780), Revolutionary general, was born in 1736 at Andover, Mass., being descended from Daniel Poor, one of its first settlers. He engaged in mercantile business at Exeter, N. H., and in 1775 was appointed colonel. He served at the siege of Boston, then went to New York, and was sent to take part in the invasion of Canada. In February, 1777, he was appointed brigadier-general, and as such was engaged in resisting Burgoyne's invasion. He afterwards served under Washington, spent the winter at Valley Forge, fought at Monmouth in 1778, and was in Sullivan's expedition against the Indians of Western New York in 1779. In the next year he had command of a brigade of light infantry under Lafayette. He was killed in a duel with a French officer near Hackensack, N. J., Sept. 8, 1780.

POORE, BENJAMIN PERLEY (1820-1887), journalist, was born at Newburyport, Mass., Nov. 2, 1820. He was descended from John Poore, who came from England in 1635, and purchased from the Indians in 1650 Indian Hill in Newbury, on which Ben resided most of his life. He was educated at Dummer Academy, learned the printer's trade, and went to Athens, Ga., where he edited the *Southern Whig* from 1838 to 1840. He was then made agent of the State of Massachusetts to obtain in Europe historical documents and was connected with the U. S. legation to Belgium. After travelling over Europe and as far as Egypt and Palestine he returned in 1847 and became Washington correspondent of the Boston *Atlas* and afterwards of other papers. He introduced the practice of reporting the Washington news by telegraph. He was clerk of the Senate committee on foreign affairs, and clerk of the printing committee for 20 years. He died at Washington, D. C., May 30, 1887. He compiled by order of Congress several works, among which were *Our Diplomatic Relations, Federal and State Constitutions, Colonial Charters, Catalogue of Government Publications*. He issued annually the *Congressional Directory*. He published *Lives of Generals Zachary Taylor, Grant, Logan, and Burnside*. His last work was *Perley's Reminiscences* (2 vols., 1886). He was prominent in the Masonic fraternity, having taken the 33d degree, and contributed to this work the article on FREE MASONRY.

POPE, JOHN, major-general, was born at Kaskaskia, Ill., March 12, 1823, being the son of Judge Nathaniel Pope (1785-1850). He graduated at West Point in 1842, and entered the topographical engineers. He served under Gen. Taylor in the Mexican war and won two brevets for gallantry. From 1849 to 1859 he was engaged in exploring expeditions in Minnesota, New Mexico, Texas, and among the Rocky Mountains. He was afterwards engaged in light-house duty. His intense loyalty to the Union induced him to use such remarks on Pres. Buchanan's policy in reference to the United States forts in the South that he was summoned before a court-martial, but the trial was not pressed. Capt. Pope was one of the officers who escorted Lincoln to Washington before his inauguration as President. In May, 1861, he was made brigadier-general and assigned to command in Missouri, where

he was successful in suppressing rebel movements. Early in 1862 he had command of the Army of the Mississippi and by his vigorous movements in March he captured New Madrid and Island No. 10 with thousands of prisoners. He was then promoted major-general of volunteers and brigadier-general in the regular army. He took command of the Army of Virginia, which consisted of all the troops in that State except those under McClellan near Richmond. Unfortunately he inaugurated his command with boastful proclamations which set forth the achievements of the armies in the West in contrast with the want of success in the East. He left Washington on July 29 with rash pledges of victory, and a month later was completely defeated by Gen. "Stonewall" Jackson at Bull Run (see BULL RUN). He returned to Washington and soon asked to be relieved from the command. He attributed his defeat to the want of proper support by the officers who had been under Gen. McClellan's command. The controversy raged especially around the conduct of Gen. Fitz John Porter, and took a political form. Gen. Pope was sent to Minnesota and engaged in a campaign with the Sioux. After the war he commanded a military district in the South and later had command of the Department of the Missouri. In October, 1882, he was made major-general in the regular army. He published *Explorations from the Red River to the Rio Grande and Campaign in Virginia* (1863).

PORCHER, FRANCIS PEYRE, physician and botanist, was born at St. John's Berkeley, S. C., Dec. 14, 1825. He is of Huguenot descent, graduated at South Carolina College in 1844, then studied medicine, and received his degree from Charleston Medical College in 1847. He lectured on medical subjects at Charleston and edited the *Charleston Medical Journal*. During the civil war he had charge of Confederate hospitals at Norfolk and Petersburg, Va. In 1872 he was elected president of the South Carolina Medical Association. His chief publications are *Medical Botany of South Carolina* (1849); *Cryptogamic Plants of the United States* (1854); *Resources of Southern Fields and Forests* (1863).

PORGY or MENHADEN. See **FISHERIES**.

PORK. See **SWINE**.

PORTER, ANDREW (1743-1813), general, was born at Worcester, Montgomery co., Pa., Sept. 24, 1743. He was engaged as a school-teacher in Philadelphia, when Congress in 1776 appointed him a captain of marines. He was soon employed in the artillery service and fought at Trenton, Princeton, Brandywine, and Germantown. In 1779 he took part in Gen. Sullivan's expedition against the Indians of Western New York. After the war he was a commissioner to run the boundary lines of Pennsylvania (1784), was major-general of militia (1800), and surveyor-general (1809). At the outbreak of the war of 1812 Pres. Madison offered him a commission as brigadier-general, but he declined on account of his age. He died at Harrisburg, Pa., Nov. 16, 1813.

His eldest son, **DAVID R. PORTER** (1788-1867), was governor of Pennsylvania 1839-45. Charges of irregularity in his election gave occasion for what was called the "Buckshot War" in the organization of the Legislature. He died at Harrisburg, Aug. 6, 1867.

Another son, **JAMES MADISON PORTER** (1793-1862), was a member of the Pennsylvania Constitutional Convention in 1838, and was appointed secretary of war by Pres. Tyler, but rejected by the Senate. He was afterwards a State judge, and one of the founders of Lafayette College, Easton.

His nephew, **ANDREW PORTER** (1819-1872), general, was born at Lancaster, Pa., July 10, 1819. He graduated at West Point in 1837, and served in the Mexican war with distinction. At the outbreak of the civil war he was made colonel in the regular army and then brigadier-general of volunteers. He commanded a brigade of regulars at the battle of Bull

Run, and was afterwards provost-general of the Army of the Potomac. He resigned in April, 1864, and died at Paris, Jan. 4, 1872.

HORACE PORTER, son of Gov. David R. Porter, was born in Huntingdon co., Pa., April 15, 1837. He graduated at West Point in 1860 and entered the artillery. In October, 1861, he went as assistant ordnance-officer to Port Royal, S. C., and he took part in the siege of Fort Pulaski on the Savannah River. He was chief of ordnance in different armies from July, 1862, to November, 1863. In April, 1864, he was made aide-de-camp to Gen. Grant with rank of lieutenant-colonel, and continued with him till the close of the war. He then made tours of inspection in the South and on the Pacific coast until Gen. Grant became President, when he was made his military secretary. In 1873 Col. Porter resigned to take part in railroad management. He has published *West Point Life* (1866), and has contributed to various magazines.

PORTER, DAVID (1780-1843), naval-officer, was born at Boston, Feb. 1, 1780. His father, of the same name, was captain of a merchant-vessel and the son early went to sea. In April, 1798, he entered the U. S. navy as midshipman and was on board the Constitution in her fight with L'Insurgente in the West Indies. He was made lieutenant in 1799 and was wounded in an engagement with pirates at Santo Domingo. His next service was in the war with Tripoli, but after some exploits he was captured in the ship Philadelphia aground in Tripoli harbor in October, 1803. A captivity of eighteen months followed. In July, 1812, he was appointed to the command of the Essex (32 guns) and sailed on a cruise to the Pacific memorable in American annals. Among his captures was the British ship Alert (20 guns), the first man-of-war so taken. Of twelve other vessels captured some were armed by him to protect American whale-fishers. On March 28, 1814, his cruise was brought to a close in the harbor of Valparaiso, where after a desperate fight he was overpowered by a British frigate (36 guns) and a sloop (28 guns). Porter wrote to his government, "We are unfortunate, but not disgraced." David G. Farragut, then a lad of twelve, had served as midshipman in the Essex and won Porter's commendation (see FARRAGUT, in the *ENCYCLOPÆDIA BRITANNICA*). Capt. Porter was employed as naval-commissioner from 1815 to 1823. He then took command of an expedition against the pirates in the West Indies, but having exceeded his power in exacting an apology from the authorities at Porto Rico for an insult to the American flag, was recalled and suspended for six months. He resigned his commission in August, 1826, and was appointed commander-in-chief of the Mexican navy in the war against Spain. In 1829 he was sent as U. S. consul to Algiers, and in 1830 as chargé d'affaires to Turkey, where he was afterwards minister-resident. He died at Constantinople March 28, 1843, and his remains were afterwards interred at Philadelphia. He published a *Journal of the Cruise of the Essex* (2 vols., 1815), and from his letters was compiled *Constantinople and its Environs* (2 vols., 1835).

PORTER, DAVID DIXON, admiral, son of the preceding, was born at Philadelphia, June 8, 1814. When his father took command of the Mexican navy he was made a midshipman and was captured on the Guerrero after a severe fight. In 1829 he became a midshipman in the U. S. navy and served in various waters until 1845, when he was stationed at the Washington Observatory. In the Mexican war he served at Vera Cruz and other points. He was afterwards engaged in the coast-survey, as he has been before for four years (1836-40), and in 1849 entered on command of the Californian mail-steamers. At the outbreak of the civil war he held a commander's commission and was sent to the relief of Fort Pickens, at Pensacola. He prepared a flotilla of mortar-boats for service in the expedition against New Orleans. After

the capture of this city the flotilla was employed against Vicksburg, and Porter with the rank of rear-admiral had command of all the naval forces on the Mississippi. Steamboats covered with iron plates were used in many places for attack and for transport. Arkansas Post was captured in January, 1863, and the Grand Gulf batteries destroyed in April. Porter's efficient and generous co-operation in the siege of Vicksburg was repeatedly acknowledged by Gen. Grant. He afterwards assisted in Gen. Banks's Red River expedition in April, 1864, and in the same year was transferred to the James River. Here he had command of the naval forces which took part in the expedition against Fort Fisher (*q. v.*) and captured it Jan. 15, 1865. He was made vice-admiral in 1866 and was superintendent of the Naval Academy for two years. On the death of Farragut in 1870 Porter succeeded him as admiral of the navy. He has in recent years published several books, among which are *Life of Commodore David Porter* (1875); *Incidents and Anecdotes of the Civil War* (1885); two novels, *Allen a Dare* and *Robert le Diable* (1885); *Harry Marline* (1886); and a *History of the Navy in the War of the Rebellion* (1887).

WILLIAM DAVID PORTER (1809-1864) was another son of Commodore David Porter, born at New Orleans, March 10, 1809. Entering the navy as midshipman in 1823, he retired in 1855, having in the meantime originated the light-house system now in use. He returned to the service in 1859, commanded the iron-clad Essex on the Mississippi in 1862, and safely passed the Confederate batteries on his way to New Orleans. For his exploits he was made commodore in July, 1862, but was obliged by ill health to retire from service. He died at New York, May 1, 1864.

PORTER, FITZ JOHN, general, was born at Portsmouth, N. H., June 13, 1822, being a nephew of Commodore David Porter. He graduated at West Point in 1845, entered the artillery and served with distinction in the Mexican war under Gen. Scott from Vera Cruz to the capture of the City of Mexico, where he was wounded Sept. 13, 1847. He was afterwards instructor of artillery and cavalry at West Point and in 1856 was transferred to the adjutant-general's department. He served in the Utah expedition in 1858. At the outbreak of the civil war he was made colonel in the regular army and soon after brigadier-general of volunteers. He was chief of staff to Gen. Robert Patterson and to Gen. N. P. Banks until August, 1861, when he had command of a division in the defences of Washington. In Gen. McClellan's Peninsular campaign Porter had direction of the siege of Yorktown, afterwards commanded the fifth corps of the Army of the Potomac. His gallantry was displayed at Mechanicsville, Gaines's Mill and Malvern Hill. After the failure of the attack on Richmond Fitz John Porter's corps was transferred to the Army of Virginia under Gen. Pope. At the second battle of Bull Run, Aug. 29, 1862, he was ordered to attack Gen. Jackson's flank, but did not move on account of the presence of Gen. Longstreet in front. Gen. Pope afterwards attributed his defeat to Gen. Porter's inactivity and even charged him with treachery. McClellan returned to the chief command and Fitz John Porter fought under him at Antietam, but on November 27 he was tried by court-martial on a charge of disobedience of orders, and on Jan. 21, 1863, he was cashiered. After many efforts to obtain a rehearing of his case, a board of inquiry was called by Pres. Hayes in April, 1878, which eventually declared Gen. Porter free from blame. Pres. Arthur in May, 1882, remitted part of his sentence, but vetoed a bill passed by Congress for his relief, on account of its unjust effect on other officers. In 1885 a bill free from this objection was passed and signed by Pres. Cleveland, and on Aug. 7, 1886, Gen. Porter was restored to the army with the rank of colonel. Gen. Porter had in the meantime been engaged in business in New York city, and was superintendent of the New

Jersey insane asylum. In 1875 he was appointed commissioner of public works in New York city. From 1884 to 1888 he was police commissioner. Gen. Grant, while President, had refused to reopen Gen. Porter's case, but afterwards became convinced of his innocence and published an article to that effect in the *North American Review* (Dec., 1882). (See BULL RUN.)

PORTER, JOSIAS LESLIE, educator and author, was born Oct. 4, 1823, at Burt, County Donegal, Ireland. He graduated at the University of Glasgow in 1842, and studied theology at the University of Edinburgh and the Free Church College. In 1846 he was ordained in the Presbyterian Church of England and had charge of a church at Newcastle. In 1849 he was sent by the Irish Presbyterian Church as a missionary to Damascus and resided there until 1859. He travelled extensively in Palestine, Arabia, Egypt, and Northern Africa. On his return to Ireland he was made professor of Biblical criticism in the Assembly's College, Belfast. Dr. Porter was moderator of the General Assembly in 1875. He took an active part in organizing the new system of higher education in Ireland, and, in 1878, was appointed by Parliament commissioner of intermediate education. In the next year he was made president of Queen's College, Belfast, and in 1880 senator of the Royal University of Ireland. He has published *Five Years in Damascus* (2 vols., 1855); *Murray's Handbook for Syria and Palestine* (1858); *The Pentateuch and the Gospels* (1864); *Giant Cities of Bashan* (1865); *Jerusalem, Bethany and Bethlehem* (1886). He married in 1849 the youngest daughter of Rev. Dr. Henry Cooke (*q. v.*), and he has published *Life and Times of Dr. Cooke* (1871.) He has contributed to various reviews, magazines, and encyclopædias, chiefly on subjects relating to Biblical geography and history.

PORTER, NOAH, philosopher and educator, was born at Farmington, Conn., Dec. 14, 1811. His father, Rev. Dr. Noah Porter (1781-1866), was minister of that parish for fifty-five years. He graduated at Yale College in 1831, and engaged in teaching. In 1833 while tutor at Yale College he studied theology, and in April, 1836, was ordained pastor of the Congregational church at New Milford, Conn. In 1843 he accepted a call to Springfield, Mass., and in 1846 he was chosen professor of metaphysics and moral philosophy at Yale College. He became president of the college on the resignation of Rev. Dr. Woolsey in 1871, and after a successful career of fifteen years himself resigned in 1886. He has contributed to several leading reviews and has published *The Human Intellect* (1868); *Books and Reading* (1870); *American Colleges and the American Public* (1870); *Elements of Intellectual Philosophy* (1871); *The Science of Nature versus the Science of Man* (1871); *Evangeline* (1882); *Elements of Moral Science* (1885); *Bishop Berkeley* (1885); *Kant's Ethics* (1886). Dr. Porter was the chief editor of the revised editions of *Webster's Dictionary*, 1864 and 1880.

PORTER, PETER BUEL (1773-1844), general, was born at Salisbury, Conn., Aug. 14, 1773. His father, Dr. Joshua Porter (1730-1825), superintended the manufacture of cannon for use in the American army during the Revolution and fought at Saratoga. Peter graduated at Yale in 1791, studied law at Litchfield, and settled in Western New York, where he had large estates. He was elected to Congress in 1808 and he was active in the measures leading to a declaration of war against Great Britain in 1812. He then resigned to become quartermaster-general of New York and afterwards had command of volunteers who drove out the British invaders. In 1814 he led a brigade into Canada under Gen. Brown and fought at Chippewa and Lundy's Lane. On Sept. 17, while besieged at Fort Erie, he made a sortie which compelled the enemy to depart. His services were acknowledged by Congress with a gold medal and by New York State with a sword. In 1816 he was employed as commissioner

in settling the boundary between Canada and the United States. He was afterwards secretary of state of New York, and was secretary of war in the administration of Pres. John Quincy Adams. He was prominent in the progress of Western New York and was one of the projectors of the Erie Canal. He died at Niagara Falls, March 20, 1844.

His only son, PETER AUGUSTUS PORTER (1827-1864), graduated at Harvard College in 1845, studied in Germany, and was elected to the Legislature of New York in 1861. He raised a regiment for service in the civil war and was killed at Cold Harbor, June 3, 1864.

PORT HURON, a city of Michigan, the county-seat of St. Clair co., is on the St. Clair River, at the mouth of the Black River, and at the foot of Lake Huron, 62 miles N. N. E. of Detroit. It is the terminus of three railroads, the Grand Trunk, the Chicago and Grand Trunk, and the Port Huron and North-western. There are 4 iron bridges over the rivers, 2 of which are railroad bridges, and a railroad tunnel is now being built under St. Clair River to Sarnia on the Canadian side. With this town there is steam-ferry communication and steamboats also ply to Detroit daily while navigation is open. Port Huron has a fine building for the U. S. custom-house and post-office, erected in 1877, a city-hall, 1 national and 3 other banks, an opera-house, 1 daily and 4 weekly newspapers, 9 churches, and 7 schools with substantial buildings. Timber is brought in large quantities by the Black River and manufactured and shipped here. There are several saw-mills, ship-yards, dry-docks, grain-elevators, machine- and boiler-shops, threshing-machine-works, and extensive car-works and railroad repair-shops. In the vicinity large quantities of salt are produced and natural gas and some petroleum are obtained. The city is supplied with water from Lake Huron by the Holly system. It has three small parks. The valuation of property is \$5,000,000, its public debt is \$150,000, and its yearly expenses about \$100,000. Originally settled by Canadian French in 1819, it was incorporated as a city in 1857. Its population in 1880 was 8883.

PORT JERVIS, an incorporated town of Orange co., N. Y., is on the Delaware River above the mouth of the Neversink River, 88 miles N. W. of New York city, on the Erie Railroad and on the Port Jervis, Monticello, and New York Railroad. It is close to the border of New Jersey and a bridge connects it with Pike co., Pa. It has 2 national banks, 7 schools, 2 daily and 3 weekly newspapers, 2 foundries, the Erie Railroad machine-shops, planing-, saw-, and feed-mills, 2 glass-works, boot-and-shoe-factory, glove-works, and watch-case-factory. The village was settled in 1826 and incorporated in 1853. It has a park and water-works and is lighted with gas and electric light. It is free of debt and its public yearly expenses are about \$20,000. Population in 1880 was 8678.

PORTLAND, a city of Maine, seat of Cumberland co., is in 43° 40' N. lat. and 70° 14' W. long., on a peninsula of 1666 acres in Casco Bay. It is 62 miles S. S. W. of Augusta, capital of the State. Besides the facilities for commerce furnished by its deep and capacious harbor, it has five railroads, the Grand Trunk, Maine Central, Boston and Maine, Portland and Ogdensburg, and Portland and Rochester. The important buildings include the custom-house, post-office, city-hall, court-house, observatory, Baxter Hall, Mechanics' Hall, Maine general hospital, public library. The Society of Natural History and the Society of Art have valuable collections. Besides 6 national banks there are 8 others. There are 15 hotels, 4 daily and 11 weekly newspapers, and 26 schools. There are 32 churches, several of which have fine edifices. The industrial works comprise rolling-mills, stove-foundries, locomotive- and boiler-works, sugar-refineries, shoe-factories, carriage-works. Rising gradually from the harbor and well shaded Portland presents a very picturesque appearance. It has gas and electric light, water-works, and a park called "The Oaks." Its prop-

erty is assessed at \$33,752,040 in 1888; its public debt is \$3,440,000, and the city expenses for 1887 exceeded \$936,000. The first settlement was made here in 1633, and it was included in the town of Falmouth, which was incorporated in 1650. Portland was burnt by Indians in 1676. by French and Indians in 1690, by the British in 1775. It was incorporated in 1786 and received a city charter in 1832, having on its seal the motto "Resurgam." In 1866 it again suffered from a disastrous conflagration. Its population in 1880 was 33,810.

PORTLAND, the largest city of Oregon, county-seat of Multnomah co., is on the Willamette River, 12 miles from its confluence with the Columbia and about 120 miles from the ocean, yet it is virtually a seaport to which large vessels come from various parts of the world. It is in 45° 30' N. lat. and 122° 27' 30" W. long. It has a fine court-house, a U. S. government building, 10 banks, several large hotels, 3 public halls, a theatre, a high-school, good public schools, a female academy, a large library, asylum for the insane, and 25 churches. The industrial works comprise iron-foundries, machine-shops, flour-mills, saw-mills, canneries, breweries, furniture-factories, shoe-factories, etc. There are 5 daily and 15 weekly newspapers and 2 monthly magazines published here. Lumber, wheat, flour, and wool are largely exported. Portland is a handsome city, with wide, well-shaded streets, and has four lines of street railway. It has gas- and water-works. It is the terminus of the Oregon Railway and Navigation Company's system. It was settled in 1845, became a city in 1851, and in 1880 had a population of 17,577. Its present population exceeds 40,000.

PORTSMOUTH, a city of New Hampshire, half-shire-town of Rockingham co., is on the Piscataqua River, 3 miles from the Atlantic Ocean, and 54 miles N. N. E. of Boston. It is built on the slope of a peninsula, overlooking a deep, capacious harbor with rock bottom. The streets are well shaded and there are many antique mansions. Portsmouth has a custom-house, an atheneum, with a library of 10,000 volumes, a music-hall, 4 national banks, 2 savings banks, and 11 churches, some of which have fine structures. Three daily and three weekly newspapers are published here. The manufactures include cotton and woollen goods, hosiery, shoes, iron-castings, etc. Ship-building is still carried on, but the commerce has declined. The U. S. navy-yard of Kittery, on an island opposite, has 3 large ship-houses and a floating balance-dock, 350 feet long by 105 wide, with 24 pumps. Portsmouth was settled in 1623, but did not receive a city charter until 1849. It was the capital of New Hampshire until 1807. It is now a favorite summer-resort. Its population in 1880 was 9690.

PORTSMOUTH, a city of Ohio, seat of Scioto co., is on the Ohio River, at the mouth of the Scioto, 113 miles E. S. E. of Cincinnati. It is on the Scioto Valley, the Ohio and North-western, and the Cincinnati, Washington, and Baltimore Railroads. It has a court-house, 2 opera-houses, 3 national banks, and 1 other bank, 1 daily, 5 weekly, and 2 monthly newspapers, 21 churches, 6 public schools, and a young ladies' seminary. The industrial works comprise 2 rolling-mills, 3 foundries, 2 woollen-mills, 2 stone-mills, 3 saw-mills, steel-spring-works, a tannery, wheelbarrow, furniture, and shoe-factories. Iron is abundant in the vicinity. Portsmouth has gas and electric light, a paid fire department, a street railway, a Holly system of water-works. The city is partly enclosed by hills and on the opposite side of the Ohio there are hills 500 feet high. Population in 1880 was 11,321.

PORTSMOUTH, a city of Virginia, county-seat of Norfolk co., is on the west bank of the Elizabeth River, opposite Norfolk. It has a fine harbor, the river here being about two-thirds of a mile wide. In the suburb of Gosport is a U. S. navy-yard with a granite dry-dock and a marine-hospital. The navy-yard was destroyed at the beginning of the civil war, to prevent its

stores from falling into the hands of the Confederates, but has since been restored. Portsmouth has 2 banks, 15 churches, 2 daily and 3 weekly newspapers, good public and private schools. It exports lumber, naval stores, cotton, and iron. Early vegetables are extensively shipped to Northern cities. Portsmouth in 1880 had 14,870 inhabitants.

POST. TRUMAN MARCELLUS (1810-1886), clergyman, was born at Middlebury, Vt., June 3, 1810. He graduated at the college of that town in 1829 and while studying law was tutor there. In 1832 he went to Washington and thence to St. Louis, and settled at Jacksonville, Ill., where he was made professor of languages in Illinois College, and also in 1840 ordained pastor of the Congregational Church. In 1847 he was called to the pastorate of the Third Presbyterian Church of St. Louis, and in 1851 he formed the First Congregational Church there. He exerted great influence and was the prominent representative of New England views in theology, education, and public affairs. Besides attending to his pastoral duties he was professor of history in Washington University, St. Louis, professor of ecclesiastical history in Chicago Theological Seminary, and delivered some lectures in Andover Theological Seminary. He died Dec. 31, 1886. He published *The Skeptical Era in Modern History* (1856) and contributed to the *Andover Review* and other periodicals.

POSTAL SERVICE OF THE UNITED STATES.

See Vol. XIX. Probably the first attempt to establish postal service within any part of the territory now embraced in the United States was made by the General Court

of Massachusetts in 1639—just nineteen years after the landing of the Pilgrims, and only four years after the proclamation of the Crown establishing a general postal system in England. On the records of the court for that year we find the following entry: "It is ordered that notice be given that Richard Fairbanks his house in Boston is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither to be left with him; and he is to take care that they are to be delivered or sent according to the direction. And he is allowed for every letter a penny, and must answer all miscarriages through his own neglect in this kind." This service was in a short time expanded into one for the transmission and delivery of letters other than those for or from foreign parts; though its administration did not give universal satisfaction; for on the records of the General Court in 1667 is a petition of citizens of the colony for "better arrangements for the sending and receipt of mails"—the petition alleging a number of grievances, one among them being the frequent loss of letters.

In 1657 mail service existed also in the colony of Virginia, but of a very primitive character. By act of Assembly March 13, 1657, it was provided "that all letters superscribed for the public service shall be immediately conveyed from plantation to plantation to the place and person directed, under a penalty of one hogshead of tobacco for each default." Although this system was intended solely for the transmission of letters on official business, it is not unreasonable to assume that private letters were by general consent at times transmitted in the same way; but of course this could not have accommodated the growing demands of the Colony, and so we find that later on, in 1692, an act of Assembly was passed providing for the "erection and establishment" of a post-office, as a matter of "general concernment and of great advantage for the increase and preservation of trade and commerce."

In 1672 the government of the colony of New York established a "post to goe monthly from New York to Boston;" and notice was given to "those that bee disposed to send letters, to bring them to the secretary's office, where in a lockt box they shall bee preserved till the messenger calls for them, all persons paying the post before the bagg bee sealed up." This monthly dispatch was evidently for a long time sufficient

for the wants of the public. Thirty years later it was changed to a fortnightly one, as appears from the following notice published in the *Boston News Letter*: "By order of the Postmaster-General of North America: These are to give notice that on Monday night, the 6th of December (1702), the western post between Boston and New York sets out once a fortnight the three winter months of December, January, and February, and to go alternately, from Boston to Saybrook and Hartford, to exchange the mayl of letters with the New York ryder; and all persons that sends letters from Boston to Connecticut after the 13th inst. are hereby notified first to pay the postage on the same."

In Pennsylvania the first record of any postal service is to be found in a law of the provincial Assembly passed in 1683, which required that "every justice of the peace, sheriff, or constable within the respective counties of this province and territories thereof, to whose hands or knowledge any letter or letters shall come directed to or from the governor, shall dispatch them three hours at the furthest after the receipt or knowledge thereof, to the next sheriff or constable, and so forwards as the letters direct, upon the penalty of twenty shillings for every hour's delay." This, like the law of Virginia, was intended for public letters only; but in 1693 the General Assembly of the province passed a "law for erecting a post-office," whereby authority was given to Andrew Hamilton to establish a "general post-office at Philadelphia, from whence all letters and packets may be with all expedition sent into any of the parts of New England and other the adjacent colonies in these parts of America, at which said office all returns and answers may be received."

In Maryland and the two Carolinas there does not appear to have been any postal service whatever until very much later than the foregoing dates. Even as late as about 1755, postal communication between points south of Philadelphia was without any regularity, as is seen in the following passage from Dr. Wm. Douglass's *Historical and Political Summary of British Settlements in North America* (1755): "From Piscataqua or Portsmouth to Philadelphia is a regular postage; from thence to Williamsburg is uncertain, because the post does not proceed until letters are lodged sufficient to pay the charge of the post-riders. From Williamsburg, in Virginia, to Charlestown, in South Carolina, the post-carriage is still more uncertain."

In 1692 the postal service of the colonies was, by authority of the government of Great Britain, placed in charge of an officer of the Crown called the Deputy Postmaster-General for America; but practically each colony exercised the right to govern the service within its own territory, and to fix its own schedule of postages; and this state of things continued until 1710, when by formal act of Parliament (9 Queen Anne, chap. 10) the first organized system for the transmission of the mails in the colonies was created. By this act the Postmaster-General was required "to keep his chief office in New York, and other chief offices in some convenient place or places in other of her Majesty's provinces or colonies in America;" a monopoly was established, not only in the carriage of letters, but of parcels of goods and the transport of travellers; and a fixed tariff of charges therefor was prescribed. The following were the rates for letters and parcels fixed by this act, which were without material modification renewed by the act of 1765 (5 Geo. III., chap. xxv.):

All letters and packets from London to New York, in North America (or vice versa), single, 1s.; double, 2s.; treble, 3s.; one ounce in weight, 4s. From any part of the West Indies to New York, single, 4d.; double, 8d.; treble, 1s.; ounce, 1s. 4d.
From New York to any place within 60 English miles thereof, or thence back to New York, single, 4d.; double, 8d.; treble, 1s.; ounce, 1s. 4d.; over 60 and not over 100 miles, single, 6d., etc.

From New York to Perth Amboy, "the chief town in East New Jersey," the single rate was 6d., as it was to "Bridlington, the chief town in West New Jersey," to New London, "the chief town in Connecticut," and to Philadelphia, it was 9d.; ounce, 3s.; to Newport, Boston, Portsmouth, and Annapolis, "the chief town in Maryland," it was 1s.; ounce, 4s.; to Williamsburg, "the chief town in Virginia," it was 1s. 3d.; ounce, 5s.; and to Charleston, S. C., it was 1s. 6d.; ounce, 6s.

The system thus begun in 1710 was not successfully managed; it yielded no revenue to the government, and, as we have seen above, in some parts of the country it furnished scarcely any mail service whatever. Even near Philadelphia, then the most populous city in the colonies, the meagreness of the mails is calculated at this day to excite a smile; for example, it was customary, down to 1750, for letters intended for persons residing in Newtown, Bristol, and Chester, in Pennsylvania, and even in Newcastle, Delaware, to remain in the Philadelphia post-office until called for. Bristol was 20 miles from Philadelphia in one direction, and Newcastle 40 miles in an opposite direction, making a distance of 60 miles with but one post-office. In 1753, however, on the death of the Deputy Postmaster-General for America, the celebrated Benjamin Franklin—who had been postmaster at Philadelphia for sixteen years—succeeded to the office by a commission from the Postmaster-General of England. He was to have for himself and an associate £600 per annum, to be made out of the profits of the service; and to do this many improvements were undertaken. For example, in the year of his appointment a penny-post, for the delivery of letters to the residences of addressees of the mail, was established at Philadelphia; in the following year a tri-weekly mail between Philadelphia and New York, in spring, summer, and fall, was established; in the next year (1755) notice was given that to assist trade, arrangements had been made by which the winter mail from Philadelphia to New England, which before had set out but once a fortnight, would thereafter set out once a week, as in summer; in 1756 the first stage probably that was started in the colonies, begun to carry the mails between Philadelphia and New York; in 1758 newspapers, which previously had been carried in the mails free, were charged with postage. Other reforms and improvements, far in advance of anything before attempted, were begun, so that in 1774, the last of Franklin's administration under the Crown, the net revenue of the postal service was over £3000. On January 30 of that year this great man was removed from office, as he himself calls it, "by a freak of the ministers," due to his pronounced advocacy of the cause of the colonies in the troubles with the mother country just then near their culmination; and from then until the middle of the following year, when the Second Congress of the colonies took upon itself the management of public affairs, the postal establishment was almost without control.

On July 26, 1775, nearly a year before the Declaration of Independence, a resolution was passed by the Continental Congress creating a post-office department with head-quarters at Philadelphia, continuing the rates of postage then in force, appointing Benjamin Franklin Postmaster-General at a salary of \$1000 a year, and giving him authority to appoint an assistant and comptroller of accounts, and as many postmasters as to him might seem proper—their salaries in no case to exceed 20 per cent. of the gross receipts of the post-office. On Nov. 7, 1776, Dr. Franklin being then in France engaged in business of a diplomatic character, his son-in-law, Richard Bache, was appointed Postmaster-General by Congress, and he remained in office until Jan. 28, 1782, when Ebenezer Hazard succeeded him. From 1775 to 1789 a vigilant supervision of the affairs of the post-office department was exercised by Congress; but owing to the existence of war during a part of that period, to the depreciation of the currency, and to more or less inefficiency in administra-

tion, the service was a constant burden upon the public treasury—repeated appropriations of money having to be made for its support—and it was otherwise unsatisfactory. It may naturally be supposed that the dispatch of the mails was irregular, and that their security could never be absolutely assured; besides which the rates of postage were exorbitant and varying—not less than eight radical changes having been made in about as many years. The last of these was in 1787, reducing by 25 per cent. the rates fixed by resolution of Oct. 18, 1782, which were as follows (the standard of value being the pennyweight of silver, rated at five-ninetieths of a dollar):

For a single letter, sent any distance under 60 miles, 1 dwt. 8 grs. or 7.4 cents; over 60 and under 100 miles, 2 dwt., or 11.1 cents; over 100 and under 200 miles, 2 dwt. 16 grs., or 14.8 cents; and an advance of 16 grs. for every additional 100 miles.

For a single letter by packet to Europe, 4 dwt., or 22.2 cents. Double rates for double letters, triple rates for triple letters, etc. (Single, double, and triple letters were those composed of one, two, or three sheets of paper, respectively—designations that had previously been used, and continued to be used until the weight standard was adopted.)

During the foregoing period—the period of the Confederation—three very noticeable provisions of law concerning the post were enacted, which deserve especial mention: The first was a provision in the Articles of Confederation (Par. 4 of Art. IX.), which, in giving the power to Congress to establish post-offices and to fix the rates of postage, coupled with the latter the condition that such rates should be sufficient "to defray the expenses of the said office"—a condition that seems to establish the fact that then, at any rate, the postal service was intended to be self-supporting. The second was a provision in the act of Oct. 18, 1782—after hostilities with Great Britain had ceased—which gave to the commander-in-chief of the army, to the President of Congress, and to the governors of the several States, the right to open or to authorize the opening of private letters in the mails. The third was a resolution of Congress passed in secret session Oct. 23, 1786—three years after the treaty of peace with England was signed—which gave a similar power to the Secretary of State for Foreign Affairs. These two latter laws remained in force until 1792. At present it is a penal offence for any officer of the government to invade the privacy of letters.

When the control of postal affairs was transferred, in 1789, from the government of the Confederation to that of the Constitution, the number of post-offices in the thirteen States then composing the Federal Union was less than 100, scattered along a line of post-routes extending from Wiscasset, in the province of Maine, to Savannah, in the State of Georgia, on which line not a single daily mail anywhere existed. The prevailing method of carrying the mails was that primitive one, the horse and rider, which furnished the post-office department with the then appropriate emblem of its seal; the rates of postage, as is shown above, were exorbitant; and the entire postal revenue for a whole year was less than double that of but one great post-office now for a single day. For the first full year after the organization of the post-office department the gross receipts of the whole service did not exceed \$25,000, arising, too, it seems "principally from letters passing from one seaport to another"; and for several years thereafter the annual revenue did not reach \$50,000. The revenue of the ten principal post-offices in 1790–91 was for one year as follows:

Philadelphia, Pa.,	\$7,087.06	Petersburg, Va.,	\$1,472.18
New York, N. Y.,	3,788.04	Alexandria, Va.,	1,234.00
Baltimore, Md.,	3,034.64	Fredericksburg, Va.,	1,059.08
Boston, Mass.,	2,883.67	Norfolk, Va.,	1,016.00
Richmond, Va.,	2,777.07	Charleston, S. C.,	810.00

So insignificant was this department of the govern-

ment that we find the gentleman intrusted with its administration in 1790—Samuel Osgood—in a letter to Alexander Hamilton, gravely discussing the question whether the postmaster-general should not be required to occupy the room at the seat of government where the mails were received and dispatched, in order that he might personally superintend the work. The following table shows the condition of the department in 1789, 1790, and 1791:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1789 (3 months only)	75	2275	\$ 7,510	\$ 7,560
1790.....	75	1875	37,935	32,140
1791.....	89	1905	46,284	36,657

Immediately after the adoption of the Constitution a law was enacted which continued for one year the old post-office establishment of the Confederation; and this law was twice renewed, until in 1792 a general act was passed establishing the post-office department upon substantially the basis which it occupied down to 1836; but this act being limited in its operation to two years, it was found necessary in 1794 to re-enact it, and without limit. The rates of postage fixed by these two laws, continuing until 1799, were as follows, being a considerable increase over the rates previously prevailing:

For every single letter, sent over 30 miles and not over 60 miles, 8 cents; over 60 and not over 100 miles, 10 cents; over 100 and not over 150 miles, 12½ cents; over 150 and not over 200 miles, 15 cents; over 200 and not over 250 miles, 17 cents; over 250 and not over 350 miles, 20 cents; over 350 and not over 450 miles, 22 cents; over 450 miles, 25 cents.

For every double letter, double these rates; triple letters, triple rates; every packet weighing one ounce avoirdupois to pay four rates.

Letters and packets passing by sea to and from the United States, or from one port to another therein, 8, 16, and 24 cents, respectively, for single, double, and triple letters.

Newspapers when sent not over 100 miles, 1 cent each; over 100 miles, 1½ cent. Free exchanges permitted between publishers.

By this act, too, authority was given the Postmaster-General to provide for the transmission of letters to foreign countries by any means which in his judgment might be proper. The following table shows the progress of the service under this schedule of postages, to 1799:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1792.....	195	5,642	\$ 67,443	\$ 54,530
1793.....	209	5,642	104,746	72,039
1794.....	450	11,984	128,947	89,972
1795.....	453	13,207	160,627	117,903
1796.....	468	13,207	195,066	131,571
1797.....	554	16,180	213,998	150,114
1798.....	639	16,180	232,977	169,084
1799.....	677	16,180	264,846	188,037

By act of March 2, 1799, the rates of postage were changed to the following—a still further advance over the rates of 1789:

For every single letter, sent not over 40 miles, 8 cents; over 40 and not over 90 miles, 10 cents; over 90 and not over 150 miles, 12½ cents; over 150 and not over 300 miles, 17 cents; over 300 and not over 500 miles, 25 cents. Double, triple, and ounce rates, upon the same principle as in former act.

Letters or packets brought into the United States, or carried from one port therein to another, 6 cents, if for delivery at the port; if for interior delivery, 2 cents more.

Newspapers, same rates as before, except that if for delivery within the State where published 1 cent only on each was chargeable. Free exchanges between publishers.

Magazines and pamphlets, 1 cent a sheet for not over 50 miles; 1½ cent for over 50 and not over 100 miles; and 2 cents for any greater distance. (A sheet was reckoned as 4 pages folio, 8 pages octavo, and so on.)

These rates continued without material alteration until Dec. 23, 1814, when an addition of 50 per cent. to all of them was authorized—a war-measure—which addition remained in force until 1816. In 1810, how-

ever, the drop or local rate of postage on letters was fixed, and for the first time, at one cent each. The progress of the service to 1816 is shown in the following table:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1800.....	903	20,817	\$280,804	\$213,994
1805.....	1558	31,076	421,373	377,367
1810.....	2300	36,406	552,366	495,969
1812.....	2610	39,378	649,208	540,165
1814.....	2670	41,736	730,370	727,126
1815.....	3000	43,748	1,043,065	748,121
1816.....	3260	48,673	961,782	804,422

In 1816, under the act of April 9, the following new schedule of rates was authorized, which remained practically unchanged for twenty-nine years:

For a single letter, sent not over 30 miles, 6 cents; over 30 and not over 80 miles, 10 cents; over 80 and not over 150 miles, 12½ cents; over 150 and not over 400 miles, 18 cents; over 400 miles, 25 cents. Double, triple, and ounce rates according to principle of former laws. Same provisions, also, as to newspapers, magazines, and pamphlets, and as to drop letters.

The period during which these rates were in force is memorable for five things: 1st, the efforts of postal reformers to have books admitted to the mails, which, strange as it may appear to us now, were strenuously and successfully resisted by the department; 2d, the transportation of the mails on railroads, which was begun in 1834, and which was, it appears, to the post-office authorities, a decidedly unpleasant innovation; 3d, the radical change, made during the incumbency of Amos Kendall as Postmaster-General, in 1836, and upon his recommendation, in the manner of keeping postal accounts, which before that time had been practically under the control of the post-office department, but which afterwards were placed in charge of an Auditor of the Treasury, and by him audited and settled independently of the Postmaster-General; 4th, the tendency to extravagance in the administration of the postal service, and a manifest indifference to the self-supporting policy that had previously prevailed, as shown by the fact that in nineteen years out of twenty-nine the postal expenditures exceeded the receipts; and 5th, the establishment of the electric telegraph, in 1845, which, though brought into being by the aid of the government, was suffered to pass, in spite of the energetic protests of the Postmaster-General, into private hands. The progress of the service during this period, however, was very great, as is shown by the following table:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1817.....	3,459	52,089	\$1,002,973	\$ 916,515
1818.....	3,618	59,473	1,130,235	1,035,832
1819.....	4,000	67,586	1,204,737	1,117,861
1820.....	4,500	72,492	1,111,927	1,160,926
1825.....	5,677	94,052	1,306,525	1,229,043
1830.....	8,450	115,176	1,850,583	1,932,708
1835.....	10,770	112,774	2,993,356	2,757,350
1840.....	13,468	155,739	4,543,522	4,718,236
1844.....	14,103	144,687	4,237,288	4,296,513
1845.....	14,183	143,940	4,289,841	4,320,732

By act of March 3, 1845, a very marked reduction and simplification was made in the rates of postage, as is seen from the following statement:

For a single letter (not over ½ ounce), sent less than 300 miles, 5 cents; over 300 miles, 10 cents; every additional half ounce an additional rate. Drop letters, 2 cents each.

Newspapers of not more than 1900 square inches, sent within 30 miles of the office of publication, free; of less size, sent over 30 miles from office, 1 cent each for not over 100 miles, and 1½ cent for over that distance. Newspapers of greater size, same rates as magazines.

Printed or lithographed circulars, handbills, etc., on sheets not larger than single cap paper, 2 cents a sheet without regard to distance.

Pamphlets, periodicals, and magazines, 2½ cents an ounce without regard to distance. Bound books expressly excluded from the mails.

During the period when these rates were in force—that is to say down to 1851—two events occurred that are worthy of special mention: one was the negotiation of a postal treaty with England—the first in the history of the department—by which the single rate of ocean postage was fixed at 5 cents; and the other was the introduction of postage-stamps in 1847, although their use was not made obligatory until several years afterwards.

Years.	Offices.	Miles.	Revenue.	Expenditures.
1846.....	14,601	152,865	\$3,489,199	\$4,084,297
1847.....	15,146	153,818	3,955,893	3,979,570
1848.....	16,159	163,208	4,371,077	4,326,850
1849.....	16,749	163,703	4,905,176	4,479,049
1850.....	18,417	178,672	5,552,971	5,212,953
1851.....	19,790	196,290	6,737,867	6,278,402

In 1851, by act of March 3, the most remarkable reduction that had yet been made in the rates of postage was authorized. The following were the new rates:

Every single letter ($\frac{1}{2}$ ounce), sent not over 3000 miles, prepaid, 3 cents; not prepaid, 5 cents; any greater distance, double these rates. Drop or local letters, 1 cent each. Every additional half ounce, an additional rate.

Newspapers, weekly, free in county where published; outside of county, 5 to 30 cents a quarter, according to distance; other than weeklies, higher rates, varying according to distance.

Magazines, books, and other printed matter, 1 cent an ounce for not over 500 miles; 2 cents for over 500 and not over 1500 miles; 3 cents for over 1500 and not over 2500 miles; 4 cents for over 2500 and not over 3500 miles; and 5 cents for over 3500 miles.

In 1852, by act of Aug. 30, the rates on printed matter were radically changed, one cent an ounce being the general rate on newspapers, periodicals, and unsealed circulars, with certain reductions for prepayment, and one cent an ounce the general rate on books when prepaid and sent not over 3000 miles. By this same act stamped envelopes, since become so popular, were authorized.

Again, in 1855, by act of March 3, prepayment of postage on letters was made compulsory—the rates being 3 cents a half ounce for distances not over 3000 miles, and 10 cents for greater distances; drop letters, 1 cent each. By the same act the system for registering letters was introduced—now a very important branch of the postal service.

In 1861, by act of Feb. 27, merchandise was for the first time admitted to the mails—the articles admitted being maps, photographs, phonographic paper, letter envelopes, and seeds and cuttings, postage on all of which was fixed at a cent an ounce for less than 1500 miles, and 2 cents for greater distances. By the same act letter postage to and from the Pacific slope was fixed at 10 cents a half ounce.

The growth of the service to 1863 is shown in the following table:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1852.....	20,901	214,284	\$6,925,971	\$7,108,459
1853.....	22,320	217,743	6,940,725	7,982,957
1854.....	23,548	219,935	6,955,586	8,577,424
1855.....	24,410	227,908	7,342,136	9,968,342
1856.....	25,565	239,642	7,620,822	10,405,286
1857.....	26,586	242,601	8,053,952	11,508,058
1858.....	27,977	260,603	8,186,793	12,722,470
1859.....	28,539	260,052	8,668,484	15,754,093
1860.....	28,498	240,954	8,518,067	19,170,610
1861.....	28,586	140,139*	8,349,296	13,606,759
1862.....	28,875	134,013*	8,299,821	11,125,364
1863.....	29,047	139,598*	11,163,790	11,314,207

* Not including routes in the insurrectionary States.

In 1863, by act of March 3, mail matter was divided into three distinct classes, on which the following rates of postage were chargeable:

First-class matter, or letters and other written matter, 3 cents a half ounce to any distance; drop-letters, 2 cents a half ounce.

VOL. IV.—F

Second-class matter, or newspapers and periodicals issued from a known office of publication, weeklies, 5 cents a quarter for each 4 ounces; semi-weeklies, 10 cents; tri-weeklies, 15 cents; six times a week, 30 cents; seven times a week, 35 cents. Weekly papers in county of publication and exchanges between publishers, free.

Third-class matter, or miscellaneous articles and transient printed matter, 2 cents for each 4 ounces; double this rate for books.

These rates remained practically unchanged for nine years, during which, however, a number of important events occurred, which render this period probably the most memorable in the history of the postal service. One was the meeting of the first International Postal Congress, brought about by the efforts of the United States government begun in 1862, and which was the first step towards the formation of the Universal Postal Union effected eleven years after; another was the establishment of the free-delivery system in 1863; another, the adoption of the great money-order system in 1864; another, the organization of the travelling post-office system in 1863, which has revolutionized the manner of separating the mails; another, the further introduction of merchandise into the mails as authorized by act of June 22, 1864; another, the introduction of envelopes bearing requests to return the letter enclosed to the writer in case of non-delivery; and another, the introduction of stamped newspaper-wrappers. The two latter innovations are purely of American origin. The growth of the service, too, was wonderful, as is shown by the following table:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1864.....	28,878	139,171*	\$12,438,254	\$12,644,786
1865.....	20,550	142,340*	14,556,159	13,694,728
1866.....	23,828	180,921	14,386,986	15,352,079
1867.....	25,163	203,245	15,237,027	19,235,483
1868.....	26,481	216,928	16,392,601	22,730,593
1869.....	27,106	223,721	18,344,511	23,698,131
1870.....	28,492	231,232	19,772,221	23,998,837
1871.....	30,045	238,359	20,037,045	24,390,104
1872.....	31,863	251,398	21,915,426	26,658,192

* Not including routes in the insurrectionary States.

By act of June 8, 1872, another rearrangement of postage rates was made as follows:

First-class matter, 3 cents a half ounce. Drop-letters at free-delivery offices, 2 cents a half ounce; at other offices, 1 cent a half ounce.

Second-class matter issued less than weekly, 1 cent each a quarter; weekly, 5 cents a quarter, less than 4 ounces; weekly, 5 cents a quarter; and 5 cents additional for each issue oftener than once a week. An additional rate for each additional 4 ounces.

Third-class matter, 1 cent for each 2 ounces. Books and samples of minerals, metals, and ores, double this rate.

Two years later than this, by act of June 23, 1874, postage on second-class matter was changed to 3 cents a pound for issues of less frequency than once a week, and to 2 cents a pound for all others; and the rate on third-class matter was made uniform at 1 cent for each 2 ounces. This latter rate was changed, however, by act of March 3, 1875, to a cent an ounce; and in the following year the rate on miscellaneous printed matter was changed back to 1 cent for each 2 ounces. No further changes of postage occurred until 1879; but two or three notable events transpired, which should be mentioned, namely: the abolition of the franking privilege by act of Jan. 31, 1873, and the adoption of official postage-stamps for the payment of postage on official matter—a system that was practically abandoned in 1877; the formation of the Universal Postal Union in 1873, by which international postage was reduced generally to 5 cents a half ounce on letters; and the introduction of postal-cards in 1873. The following table shows the growth of the service to 1879:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1873.....	33,244	256,210	\$22,996,742	\$29,084,946
1874.....	34,294	269,097	26,477,072	32,126,415
1875.....	35,547	277,873	26,791,360	33,611,309
1876.....	36,383	281,798	27,805,908	33,203,488
1877.....	37,345	292,820	27,468,323	33,486,322
1878.....	39,258	301,966	29,277,517	34,165,084
1879.....	40,855	316,711	30,041,983	33,449,898

In 1879, under the act of March 3, a reclassification of mail matter was made, the following being the rates of postage established:

First-class (sealed or written matter), 3 cents a half ounce; postal cards, 1 cent each; drop-letters at free-delivery offices, 2 cents a half ounce; at other offices, 1 cent.
 Second-class matter, newspapers and periodicals issued regularly from a known office of publication, or by news-agents, 2 cents a pound.
 Third-class matter (books and miscellaneous printed articles), 1 cent for each 2 ounces.
 Fourth-class matter (merchandise), 1 cent an ounce.

Since the passage of this act the following important changes have been made in the postal laws:

By act of March 3, 1883, the rate of postage on first-class matter was reduced from 3 to 2 cents a half ounce, the tariff of money-order fees was considerably lowered, and the issue of postal notes was authorized.

By act of June 9, 1884, postage on transient newspapers was fixed at 1 cent for each 4 ounces.

By act of March 3, 1885, the unit of weight of first-class matter was increased—the rate of postage being fixed at 2 cents an ounce instead of a half ounce; the special-delivery system, hereinafter described, was authorized; and the rate of postage on newspapers and periodicals was reduced to 1 cent a pound.

By act of June 29, 1886, the fee for money-orders of less than \$5 was reduced.

In August, 1886, the issue of stamped letter-sheet envelopes was begun, under authority of the act of March 3, 1879.

By act of Jan. 3, 1887, the free-delivery system was extended to places of 10,000 population, or \$10,000 of annual postal revenue.

By act of March 3, 1887, authority was given for the issue of postal-notes by other than money-order offices.

By act of July 24, 1888, the rate of postage on seeds, plants, bulbs, roots, scions, and cuttings was reduced from 1 cent an ounce to 1 cent for 2 ounces.

These changes and the following table bring the service down to the close of the fiscal year ending June 30, 1888:

Years.	Offices.	Miles.	Revenue.	Expenditures.
1880.....	42,989	343,888	\$33,315,479	\$36,542,804
1881.....	44,512	344,006	36,785,398	39,251,736
1882.....	46,231	343,618	41,883,005	40,482,021
1883.....	47,863	353,166	45,508,693	43,282,944
1884.....	50,017	359,530	43,335,959	47,224,560
1885.....	51,252	365,251	42,560,844	50,046,235
1886.....	53,614	368,660	43,948,423	51,004,744
1887.....	55,157	373,142	48,837,609	53,006,194
1888.....	57,376	403,976	52,695,176	55,795,357

The existing rates of postage are as follows, which, taking everything into consideration, are probably the lowest in the world:

On letters or written or sealed matter, 2 cents an ounce.
 On postal cards, 1 cent each.
 On newspapers and periodicals mailed by publishers and news-agents, 1 cent a pound.
 On books, circulars, miscellaneous printed matter, and seeds, bulbs, plants, cuttings, roots and scions, 1 cent for each 2 ounces.
 On all other matter, 1 cent an ounce.
 All matter on official business of the government enclosed in distinctive envelopes or under labels, free.
 Newspapers and periodicals sent by publishers to actual subscribers residing in the county of publication, free.
 All matter sent out by agricultural colleges and agricultural experiment stations on the subject of agriculture, free.
 Letters to countries of the Postal Union, 5 cents a half ounce.

From the foregoing sketch it will be seen that the postal service of the United States, from its humble beginning in 1789, has grown to gigantic proportions. In the course of but one century it has in its progress outstripped the service of many nations whose history goes back beyond the middle ages; and to-day in the general extent of its business it stands conspicuously ahead of all other countries. Let us judge its position by a comparison with the postal business of Great Britain, Germany, and France, the three next great nations of the Universal Postal Union.

The statistics which follow are the latest that are obtainable—those for the United States and Great Britain being taken from the Reports of the Postmasters-General for the two countries, and those for Germany and France from the tabulation of 1886 published by the International Postal Bureau at Berne.

In ascertaining the postal revenue of Great Britain, France, and Germany, the income from the telegraph service is omitted, and in the case of the latter country the income from the service of couriers and the transportation of travellers—none of these branches of business being comprehended in the postal service of the United States. The income of Germany and France is estimated upon the basis of 5 per cent. increase over the actual amount of the preceding year.

In gross postal revenue the showing is as follows:

United States—(year ending June 30, 1888).....	\$52,695,176
Germany—(year ending March 31, 1888).....	45,194,357
Great Britain—(year ending March 31, 1888).....	42,362,346
France—(year ending Dec. 31, 1887).....	28,779,301

In the number of post-offices the United States has more than the other three countries combined:

United States—(June 30, 1888).....	57,376
Germany—(Dec. 31, 1886).....	18,686
Great Britain—(March 31, 1888).....	17,587
France—(Dec. 31, 1886).....	7,296

In the length of mail routes the United States is ahead of the other countries, as is here shown:

United States—length of mail routes in miles—1888	403,976
Germany—“ “ “ “ 1886	85,885
Great Britain—“ “ “ “ 1888*	44,275
France—“ “ “ “ 1886	65,334

In the mileage of mail service annually performed the United States is immeasurably in advance of all other countries:

United States—miles of all service performed in 1888.....	287,651,055
Germany—miles of all service performed in 1886.....	132,011,695
Great Britain—miles of all service performed in 1888*.....	52,669,584
France—miles of all service performed in 1886.....	90,980,803

These figures comprehend an advance of about 10 per cent. over a computation furnished by the Secretary of the General Post-Office in London for the year 1886.

In the number of pieces of mail matter transmitted—which is the best criterion of the magnitude of the postal service—the United States is greatly in the lead, as the following table will show:

Countries.	United States, 1888	Germany, 1886
Letters mailed or delivered	1,769,800,000	720,497,240
Postal Cards “ “	372,200,000	245,282,540
Newspapers “ “	1,063,100,000	523,873,340
Mis. printed matter, pieces		210,108,220
Parcels of merchandise	372,900,000	116,305,050
Total.....	3,578,000,000	1,816,066,390

Countries.	Great Britain, 1888	France, 1886
Letters mailed or delivered	1,512,200,000	591,451,811
Postal Cards “ “	188,800,000	35,923,379
Newspapers “ “	152,300,000	92,957,793
Mis. printed matter, pieces	389,500,000	713,962,439
Parcels of merchandise	36,732,000	28,953,858
Total.....	2,279,532,000	1,463,249,280

The average number of pieces of mail matter to every inhabitant of these countries, upon the basis of the last census, is about as follows: United States, 71; Germany, 41; Great Britain, 61; France, 37.

The gross expenditure of the postal service of the several countries was as follows:

United States, year ending June 30, 1888.....	\$55,795,357
Germany, year ending Mar. 31, 1888 *.....	44,348,939
Great Britain, year ending Mar. 31, 1888.....	28,876,935
France, year ending Dec. 31, 1887 *.....	28,327,666

* These amounts are 5 per cent. over the actual expenditures of the preceding year. They also include the cost of the telegraph service.

There are several branches of the postal service of the United States which deserve special description:

1st. *The Money-Order System*, created by act of Congress of May 17, 1864. The object of this system is to provide the public with the means of making small remittances of money by mail cheaply and safely. This is accomplished through the issue of orders by one postmaster upon another, the orders being issued upon written applications therefor, the purchaser in every case being required to deposit with his application the amount of money which the order calls for, in addition to the fee. The order, after delivery to the purchaser, is usually sent by him to the payee through the mails, though it may be, of course, sent by any means. Money orders are limited by law to \$100, the fees for amounts up to that being as follows: For an order not exceeding \$5, five cents; over \$5 and not over \$10, eight cents; over \$10 and not over \$15, ten cents; over \$15 and not over \$30, 15 cents; over \$30 and not over \$50, 25 cents; over \$50 and not over \$60, 30 cents; over \$60 and not over \$70, 35 cents; over \$70 and not over \$80, 40 cents; over \$80 and up to \$100, 45 cents. The order is always upon a designated postmaster, and therefore can be paid by no other, and it is invalid if not presented within one year from its date. It is assignable to only one payee beyond the first, and cannot be paid unless

the presenter be known to the paying postmaster, or be properly identified. The principal security in the money order, however, lies in the leaving out of the order the name of the payee, and in the sending by the issuing to the paying postmaster of a secret letter of advice, giving the payee's name and all the other particulars of the order, which renders it almost impossible to make a mistake in payment. If an order be lost or invalidated by improper assignment or lapse of time or otherwise, it may be duplicated; if it be paid to the wrong person, the government is liable to the owner. The system on June 30, 1888, existed at 8241 post offices. It has upon the whole been profitable to the government, the fees amounting to more than the expenses; besides which a very large amount has been gained—probably over a million dollars—through the loss or non-presentation of orders from the beginning of the system to the present time. As the system is carried on without any working capital except such as accrues from unpaid orders, it is necessary to keep the funds in constant circulation, and as rapidly as possible to accumulate at paying centres the receipts of offices where the issues of orders exceed payments. Every postmaster is therefore required to remit daily to some post-office designated as his depository all his surplus money-order funds—an arrangement which also tends to prevent defalcations. To the country at large the money-order system has been of immeasurable benefit; for it has given a great stimulus to many branches of trade; it has been a not inconsiderable agent in the ceaseless and necessary circulation of money; and it has materially aided through its international branch that wonderful migration of people from the Old to the New World that has made the progress of America one of the marvels of history. Table I. shows the growth of the money-order business from its establishment Nov. 1, 1864, to June 30, 1888.

TABLE I.—U. S. Money-Order System.

Fiscal year (ending June 30).	Offices.	Orders issued.	Orders paid and repaid.	Fees received.	Expenses.	Deficit.	Surplus.
1865.....	419	\$1,360,122.52	\$1,313,577.08	\$11,536.40	\$18,584.37	\$7,047.97
1866.....	766	3,977,259.28	3,903,890.22	35,803.06	28,664.27	\$7,138.79

1888.....	8,241	119,649,064.98	119,743,345.25	947,316.56	406,043.79	541,272.77
Total.....	1,736,341,816.76	1,734,287,602.84

Money-order arrangements exist between the United States and the following named countries: Great Britain, France, Germany, Switzerland, Belgium, Italy, Portugal, Sweden, Netherlands, Canada, Jamaica, Windward Islands, Leeward Islands, Hawaiian Islands, New Zealand, New South Wales, Tasmania, Victoria, Queensland, Japan, India, Cape Colony, Norway, and Denmark.

By act of March 3, 1883, a new form of money-order has been added to the system's issues—known as the "postal note." These are limited in amount to \$4.99. The fee for issuing them is three cents. They are payable to bearer, but only at the post-office on which drawn, and they are transmitted always at the risk of the purchaser, and not of the government. If not presented within three months from the last

day of the month of issue, they become invalid, though a duplicate may be obtained upon payment of an additional fee. The following table shows the business of the postal-note system since its establishment :

Fiscal year.	Notes issued.	Notes paid and repaid.
1884.....	\$7,411,992.48	\$7,254,125.94
1885.....	9,996,274.37	9,948,023.80
1886.....	11,718,010.05	11,686,930.73
1887.....	11,768,824.81	11,726,767.51
1888.....	12,134,459.04	12,104,881.55

Fiscal year.	Fees received.	Expenditures.
1884.....	\$110,282.88	\$76,389.49
1885.....	152,018.58	91,275.82
1886.....	180,333.15	110,115.30
1887.....	189,844.56	82,870.72
1888.....	200,341.68	82,456.30

2d. *The Registry System*, first authorized by act of March 3, 1855. By this system additional security is intended to be given to valuable matter in its passage through the mails, the means relied on for giving this security consisting of the recording, or registering, of all matter presented for registration, the giving of receipts to the senders at the time of mailing, the receipting and careful handling of the matter by all persons through whose hands it may pass throughout its journey, and the final acknowledgment of receipt by the addressee. Thus a letter registered may be traced from hand to hand until it gets to destination, or, in case of its loss or miscarriage, up to the official who is responsible therefor. To give distinctiveness to registered matter it is enclosed in large colored envelopes, termed "registered package envelopes," which may contain one or more letters to any one office, and the condition of which must be indicated by the indorsements of all who handle it. A bill of lading, or "registry bill" as it is called, accompanies this envelope, which bill after verification is returned by the receiving to the sending postmaster. Every failure to receipt for these envelopes or their contents, every discrepancy between bill and contents, and every loss, is promptly reported and at once investigated. Much of the separate handling of and receipting for registered matter has of late years been obviated by the use of through pouches between prominent offices, the pouches being locked with tell-tale locks that can properly be opened only by the sending and receiving postmasters. Vast amounts of money, bonds, and other valuables are transmitted annually by registered mail, so that its value to the business world is beyond question ; but its greatest value is probably to people at small places where the money-order system does not exist, where banks are unknown, and where railroad, steamboat, and express lines have not been extended ; for it brings every one of these little communities into safe and expeditious commercial intercourse with the great cities, and places, as it were, their opulence and variety at its feet. The fee for registering matter is 10 cents, which is in addition to the lawful postage. The system is probably self-sustaining. The number of letters and parcels of matter registered during the past ten fiscal years is as follows :

1879.....	5,429,022	1884.....	11,246,545
1880.....	6,996,513	1885.....	11,043,256
1881.....	8,338,918	1886.....	11,648,227
1882.....	9,627,922	1887.....	12,524,421
1883.....	10,594,716	1888.....	13,677,169

3d. *The Free-Delivery System*, authorized by act of March 3, 1863.—The principal function of this branch of the postal service is to make delivery by regular carriers employed by the government, at the residences of addressees or at other specified places of address, of all mail matter that may arrive or be deposited for local delivery at what are known as free-delivery offices. In connection with this duty is that of collecting matter from designated boxes throughout the cities where the system exists, and mailing it at the

post-office. The term "free-delivery" is not strictly accurate ; for while no direct charge is made for collecting or delivering matter by the carriers, there is an indirect charge, made by doubling the local or drop rate of postage on letters at all free-delivery offices. Thus, at an office where carrier delivery is not made, the drop rate on letters is one cent an ounce or fraction thereof ; at a free-delivery office the drop rate is two cents—the difference being originally intended to maintain the system. Under the last law passed by Congress affecting the free-delivery system, authority is given the Postmaster-General to establish it at any place having a population of 10,000, or where the gross revenue of the post-office for the preceding year shall have amounted to \$10,000. The total number of free-delivery offices in existence on June 30, 1888, was 358 ; the number of carriers in service at the same time was 6346 ; and the number of pieces of matter handled by them during the year ending on that date was as follows :

Letters delivered.....	873,760,693
Postal cards delivered.....	212,426,703
Registered letters delivered.....	4,271,105
Newspapers, etc., delivered.....	428,710,933
Letters collected.....	760,113,963
Postal cards collected.....	223,980,437
Newspapers, etc., collected.....	127,597,925
Whole number of pieces handled.....	2,630,861,758

Table II. shows the growth of the free-delivery service since its establishment. It will be seen that if one-half the postage on local matter at free-delivery offices be taken as the measure of revenue resulting from the establishment and extension of the system, it has been financially a burden to the government from the beginning. If, however, the additional use of the mails, locally and otherwise, which the system undoubtedly influences, with the resulting increase of revenue, be taken into account, to say nothing of the immense amount of office separation of the mails which in the absence of carriers would have to be done by distributing clerks and paid for out of some other item of revenue, the system beyond all question has been self-sustaining. Besides, it handles an enormous amount of matter other than letters, on which no increase of the local rate of postage has been made, and from which, consequently, no increase of revenue has been derived, and it collects for mailing nearly as much matter as it delivers—a service which was probably not intended when the system was created, and which the increase in the drop rate of postage was not expected to pay for.

Prior to 1863 a carrier-delivery service existed at a few of the larger post-offices known as the "penny post"—the carriers being appointed by the department, and being allowed in the way of compensation a fee to be collected from every person to whom matter was delivered. It is a rather remarkable fact that although this system existed in England as far back as the reign of Charles II.—one Wm. Dockwra having successfully introduced it into the city of London—and was a short time afterwards authorized in this country, and sanctioned, after the separation of the colonies from England by repeated acts of Congress, it had not, down to the establishment of the free-delivery system, been extended to more than 15 or 20 post-offices in the whole country. The principal cause of this is to be found, not in the disinclination of the people to patronize the system—for we find them in many places eagerly supporting private letter expresses wherever they were permitted to exist—but in the opposition of postmasters, whose compensation, always partially dependent upon the rent of post-office boxes, the system of carrier delivery was supposed to seriously affect. Some attempts have been made within the last five or six years to bring about the re-establishment of the "penny-post" for places of less population than the law requires as a condition

TABLE II.—Free-Delivery Service of U. S. Post-Office.

1885.....	178	4,358	3,985,952.55	5,281,721.10		1,295,768.55
1886.....	181	4,841	4,312,306.70	5,839,242.97		1,526,936.27
1887.....	189	5,310	4,618,692.07	6,691,253.69		2,072,561.62
1888.....	358	6,346	5,422,35 .36	7,721,689.16		2,299,332.80

precedent to free-delivery ; but although there is little doubt that such an establishment would prove of great convenience to many communities, and would certainly not to an injurious extent affect the postal revenue, both Congress and the Post-Office Department appear to look upon it with disfavor.

4th. *The Special-Delivery System*, established by authority of the act of March 3, 1885. This system is intended to secure the immediate delivery of mail-matter, on its arrival at the post-office of destination, by means of special messengers employed for the purpose. At first its operations were confined to places having a population of 4000 or more ; but by subsequent law it was extended to all post-offices. The charge for making special delivery is ten cents, which is paid by the sender of the matter affixing to it a large and otherwise distinctive stamp, which is additional to the postage. The amount allowed messengers for every delivery is eight cents, the government thus realizing a profit of two cents. The amount of this profit is about \$30,000 a year. At large post-offices, where the amount of business will warrant it, permanent messengers are employed on special-delivery duty ; at other offices the postmaster effects delivery by any practicable means. The system has met with a reasonable amount of patronage, and may be said to supply a popular want. The following table gives the number of pieces of matter specially delivered since the system was introduced, at offices which are required to make returns :

Fiscal year (ending June 30).	Pieces ord. matter.	Pieces drop matter.	Total.
1886—9 mos. only and at 555 offices.....	622,054	274,200	896,334
1887—at free-delivery offices	725,330	299,237	1,024,567
1888—at free-delivery offices	899,494	320,782	1,220,276

5th. *The Travelling Post-office System* (generally called the Railway-Mail service).—This great system, whose main function is to make minute distribution of the mails on postal-cars, and to make immediate transfers to connecting lines—so that a letter leaving a given point at the same time as a traveller to the same destination accomplishes its journey at the same time—was begun in an unsystematic and tentative way, and not by creation of law, in the year 1862. Prior to that the work of distributing the mail was done en-

tirely in post-offices, the scheme of distribution, speaking generally, being comprehended in the massing of the mails at certain prominent offices, called "distributing post-offices"—(the number of them varying in different years from about twenty to fifty)—where minuter separation was required before further transmission could be made. The result of that system was, of course, frequent delays, unnecessary handlings, and great expense. The mail-car in those days was simply for freighting mails in bulk : now it is a post-office also, by which not only through mails are carried, but in which way mails are taken on and put off—separated and pouched for all offices on the line and their connections, and for connecting car-lines—while the car is in progress. Much separating work is necessarily still done in post-offices, such as through mails, local mails, and mails to go over other than railway routes ; but in general all mails to go over railroads where postal clerks are employed are pouched to the postal car, and there distributed, with accretions made *en route*, according to schemes intended to secure the utmost possible expedition in transmission. The travelling post-office system was not organized until 1865 : it exists now on nearly every railroad in the United States, employs thousands of officials, who handle the bulk of the entire mail of the country.

6th. *The Dead-Letter Office*.—The history of this office, whose business it is to restore to the owners letters and other mail matter that have failed of delivery, goes back to the early days of the republic, the first "inspector of dead letters" having been appointed under a resolution of the Continental Congress passed Oct. 17, 1777. Prior thereto the subject of undelivered letters had, of course, received some attention—so much so that in 1753 such letters began to be advertised ; but they were not sufficient in numbers to warrant the employment of any separate official for their treatment. For many years after the establishment of the office, everything that came into its keeping was, whenever practicable, restored to the owner ; subsequently, when the business of the office had increased considerably, the rule was changed so as to require restoration of only what was apparently valuable ; but now the original practice is revived, and everything except printed matter of no apparent interest or value, such as advertisements, circulars, etc., is restored. In

the treatment of undelivered matter at post-offices the following rules govern: If the matter bears upon it the name and address of the sender, it is returned to him direct by the postmaster at the end of 30 days; if it bears, in addition, a request to return within a given time, it is returned direct at the end of that time; if it does not bear the name of the sender, it is advertised, and, if not delivered, retained in the post-office 30 days, and finally, if still undelivered, sent to the Dead-Letter Office, where it is opened, if found necessary, and restored to the owner. Weekly returns of such matter are made by postmasters at the larger offices; monthly returns by all others. The registered matter and such as is considered valuable are recorded, and prompt restoration is made of everything of which the ownership can be ascertained. Matter of which the ownership is doubtful or not ascertainable is held subject to reclamation. All foreign dead matter is returned without examination to the country of origin. Much of the matter that reaches the Dead-Letter Office is never restored, especially if no inquiry concerning it is received; as, for example, where neither the sender nor addressee of the matter can be found, or where the writer of a letter has failed to sign his name, or has signed only a part of his name—a not inconsiderable class of letter-writers, by the way—where, as in the case of parcels, nothing appears to indicate the sender. All moneys obtained from dead letters for which no owner can be found, as well as moneys realized from the sale of unreclaimed parcels—which sale now occurs annually—are deposited in the general treasury. The moneys thus obtained amount to about \$10,000 a year. It is a curious fact that every year there are turned into the Dead-Letter Office a great many letters that bear no superscriptions whatever, but still more curious that the most of these letters are written by business men, and on important business subjects. In the examination of letters in the Dead-Letter Office, it has always been an unwritten law that no employé shall ever divulge any information he may thus acquire; indeed, it has been an established principle, seldom departed from, that the government itself has no right, even though it should be in the interests of public justice, to take advantage of secrets that the business of the Dead-Letter Office may disclose. But it is rather remarkable that no law exists which makes an offence of such a betrayal of trust, although the unauthorized opening of or prying into letters by other postal officials has been prohibited from the foundation of the government, and at times made punishable by death. The following table gives some interesting statistics of dead-letter business for the past 10 years:

Fiscal year.	Dead letters.	Am't realized.
1879.....	2,996,513	\$3,323
1880.....	3,057,141	6,506
1881.....	3,323,621	6,584
1882.....	4,285,285	7,657
1883.....	4,379,398	12,279
1884.....	4,564,451	9,619
1885.....	4,708,240	12,097
1886.....	4,791,698	8,858
1887.....	5,335,363	10,976
1888.....	6,217,876	9,118

7th. *Transportation of the Mails.*—There are five general methods of transporting the mails, namely: by railroads, by mail-messengers, by steamboats, by ocean steamers, and by what is known as "star" service. The pay for *railroad transportation* is prescribed by law of Congress, the rates being as follows: On routes carrying their whole length an average weight of 200 lbs. of mail a day, \$42.75 per mile per annum; 500 lbs., \$64.12½; 1000 lbs., \$85.50; 1500 lbs., \$106.87½; 2000 lbs., \$128.25; 3500 lbs., \$149.62½; 5000 lbs., \$171, and \$21.37½ for every additional 2000 lbs., the average weight to be ascertained by actual weighing for thirty days once every four years. On

land-grant roads the rates are somewhat less. In addition to these rates, which most postal experts consider too high, the railroad companies are allowed for the use of postal cars furnished by them, in every case where a daily trip is made each way, the following pay: \$25 per mile per annum for cars 40 feet in length; \$30 for 45-foot cars; \$40 for 50-foot cars; and \$50 for 55 or 60-foot cars. Railroad companies are required to transport the mails on their fastest trains; but with a number of trunk lines the department often enters into special arrangements for still faster time, paying for the increased expedition out of an annual appropriation for "special facilities on railroads." The companies are obliged, under a well-established practice having now the force of law, to carry the mails to and fro between railroad stations and post-offices at their own expense, when the distance is not over a quarter of a mile. *Mail-messenger* service is that which comprehends the carriage of the mails between post-offices and railroad and steamboat stations where the distance is over a quarter of a mile; between one station and another of different railroads; between post-offices and their branches in the great cities, and over routes not regularly established as post-routes. This service is usually let to the lowest bidder. *Steamboat service* is contracted for whenever such service is considered necessary—usually for four years, and at the lowest obtainable rates. *Star service* (which includes transportation by wagon, carriage, stage, horseback, or afoot) is let every four years by separate routes to the lowest bidders. For convenience in letting this service the country is divided into four contract sections, a letting of the service being made every year for one-fourth of the country. To provide for service over new routes, or over routes where contractors have failed to perform service, a miscellaneous letting is also made every year. Competition has brought the pay for star service down to low rates—in many cases to rates too low to secure good service. *Ocean steamship service* is, of course, confined to foreign mails, and is usually let for periods of two years. The limit of pay in most cases is the sea-postage of the matter conveyed. The pay for carrying United States mails through one country of the Postal Union to another is regulated by the Postal Union convention.

8th. *Organization.*—The postal service is under the general control of the Postmaster-General, who is, and has been since the administration of President Jackson, a member of the Cabinet. Under him are the First, Second, and Third Assistant Postmasters-General, the Superintendent of the Money-Order System, the General Superintendent of the Railway Mail Service, the Superintendent of Foreign Mails, the Chief Post-office Inspector, and the Superintendent of the Dead-Letter Office, each of whom has under him a corps of clerks and other employes at the seat of government. Besides these there is an officer of the Treasury Department, known as the Auditor of the Treasury for the Post-office Department, who has a close and important connection with the postal service. The several classes of postal officials outside of the department proper at Washington are postmasters and their clerks, letter-carriers, railway postal clerks, mail-messengers, and mail contractors. The First Assistant Postmaster-General has charge of the appointment and qualification of postmasters, the establishment of post-offices, the apportionment among them of the appropriations for clerk-hire, rent, light, and fuel, the supply of stationery, and the operations of the Free-Delivery System. The Second Assistant Postmaster-General has control over the transportation of the mails, the making of contracts therefor, the ascertainment of the pay of railroads for mail service, and the supply of mail-bags, locks, and keys. The duty of the Third Assistant Postmaster-General takes in all business relating to the classification of mail matter and the rates of postage, the collection and deposit of the postal revenues, the payment of

postal indebtedness, the control of the registry and special-delivery systems, and the issue to postmasters of postage-stamps, stamped envelopes, and other forms of stamped paper. The duty of the Auditor is to audit and settle quarterly the accounts of postmasters and other postal officers, and to certify for payment the several classes of postal indebtedness. The duties of the other officers named are indicated by their designations. The number of persons employed in the postal service on the 1st of March, 1887 (not including assistants in post-offices of the third and fourth classes, and employes of mail contractors on star routes), was as follows:

In Department proper at Washington.....	600
In Auditor's office at Washington	404
Postmasters of all classes.....	54,774
Assistant Postmasters, first and second-classes.....	384
Clerks in post-offices of the first and second-classes...	5,781
Messengers, janitors, and laborers in post-offices.....	222
Carriers at free-delivery offices.....	5,206
Post-office inspectors and inspectors' clerks	122
Contractors and sub-contractors, star service	14,533
Contractors and sub-contractors, steamboat service...	126
Special carriers.....	2,433
Mail messengers.....	5,412
Employes in railway-mail service.....	4,760
Miscellaneous.....	33
Total	94,790

About 5 per cent. of this number should be added to bring the statement up to June 30, 1888.

PROPOSED IMPROVEMENTS.

Among the many things that have been urged for the enlargement and improvement of the postal service of the United States these are the most important:

1. The postal service, it is said, is incomplete without the telegraph. Every other great nation has had to attach to its postal system this important medium of transmitting intelligence, and the United States, doubtless, will eventually do so too. If it is to be done at all, however, it ought to be done soon; for the only really equitable mode of beginning such a service would be to buy up all private lines of telegraph, and every year, of course, is adding to their value. The Postmasters-General, who have advocated the adoption of the telegraph, are Cave Johnson, in 1845 and 1846, under whose administration it was, by the aid of the government, brought into existence; Alex. W. Randall, in 1868; Jno. A. J. Creswell, in 1871 and 1872; Horace Maynard, in 1880; T. O. Howe, in 1882; Walter Q. Gresham, in 1883; and Don M. Dickinson, in 1888.

2. It is said, too, that the postal service should include a system of savings banks. All over the world, wherever this system exists, the patronage of it proves that the people desire a perfectly safe means of investment for small savings, even though the rate of interest be trifling. In support of the proposition the claim is made that a considerable part of the national debt might be paid off by the money deposited in postal savings banks; or, to speak more accurately, by a proper system of receiving and applying the deposits in such banks a great part of the present bonded debt might be transmuted into a savings-bank debt, held by a greater number of the people, and bearing a much lower rate of interest. The great importance, too, to the government, of the possession of a large amount of ready money in times of national peril or financial stringency, such as would be available under a postal savings-bank system, is manifest.

3. Again, it is said that the present method of compensating railroad companies for transporting the mails should be changed—the government now paying too much for the service. The items, at least, of "postal-car service" and "special facilities on railroads," which now amount annually to about \$2,000,000, should be unknown to the government ledger. That is to say, the railroad companies should

provide, without any addition to the statutory pay for mail transportation, whatever cars are necessary, so constructed as to afford the best possible facilities for postal clerks in the distribution and receipt of the mails, and they should transport these at whatever rate of speed the Postmaster-General might at any time deem necessary, just as is done under the law in England.

4. It is urged, with reason, that the civil service reform should be extended so as to take under its protection every employe of the postal service—not merely the letter-carrier and the clerk, but employes above and below these grades; that every official in the service should have a secure tenure of office co-existent with efficiency and good behavior; and that an equitable system of promotions upon competitive examination should prevail, together with one for the imposition of fines and penalties for improper conduct or inefficient service. No person under such a business-like mode of administering the department should ever be taken into its service except after such an examination, to which any man or woman of good character and sound physique should be eligible, and no one should be dismissed except for cause. In this way the service would secure and retain the best talent and character; and instead of its breeding an official aristocracy, as some over-scrupulous statesmen have apprehended, it would originate the purest kind of an official democracy.

5. As soon as postal business shall have sufficiently increased to allow of it the present absurd distinctions in the rates of postage on mail matter should end. Everything admissible to the mails at all—with the exception, perhaps, of newspapers and periodicals, which might, as at present, be granted better terms than other matter—should be placed on the same footing. The lowest rate of postage compatible with public interests should prevail, and it should be no more on a letter than on anything else. One cent for every two ounces would be a rate simple and sensible, and it would, no doubt, be ultimately profitable.

6. The government should, of course, as the law now requires, exercise a complete monopoly in the carriage of letters for pay. Private letter expresses, district telegraph companies, and the like, which in many of the large cities now invade the rights of the government, should be made to give way. It is admitted, with justice, that the exercise of the government's exclusive right in this respect should carry with it such efficient service as to render any private competition unnecessary.

7. It is further insisted that all the mails for delivery in the great cities should be separated as far as possible during their transit. For example, the mails that go into New York by rail should all be made up *en route*, so as to reach every postal station—and, for that matter, every letter-carrier—without the necessity of separation on their arrival at the post-office, and therefore in the shortest possible time. So the mails that pass from one part of the city to another, and the mails which arrive at and depart from the post-office and stations, should be carried to and fro, not by wagon service, as at present, but by underground steam conveyance. Less expense, greater rapidity of transit, and later hours for closing the mails would thus be secured.

8. The free-delivery system should be greatly extended. If, as can, perhaps, be demonstrated, free delivery is profitable and desirable where there is a population of 10,000, there is no reason why it should not be profitable in a place containing 5000 inhabitants; or, to put it differently, if it be proper to introduce it where half a dozen carriers are needed, it would be proper to extend it to every place where a single carrier could be economically employed. Indeed, in thickly settled parts of the country, the system of rural deliveries might be adopted, the same as exists in England, France, and Germany—the carrier taking

the place of the mail contractor, and collecting from and delivering mail to everybody along his route.

9. The railway officials on all trains that carry mails not in charge of postal clerks should be required to receive mail matter offered to them *en route*, and to deposit it in designated boxes along the line, or at post-offices at the termini of their several runs. In other words, the present law which requires the captain of a steamboat or the mail-carrier on a star-route to receive and properly deposit all mail matter handed to him, should apply equally to the officials of a railroad company. Greater dispatch of matter, and greater convenience to the public, would in innumerable cases result from such a regulation.

10. The system, now existing in the postal service of many European countries, under which reimbursement to a limited amount is made for losses in the mails, should be introduced, as a part of the system of registration.

11. The pneumatic tube system, now existing in London, Paris, Berlin, and Vienna, should be adopted for use in New York, Philadelphia, Chicago, Boston, and St. Louis, as a part of the system for the special delivery of letters.

12. There should be a better method of cancelling the stamps on mail matter than that now in vogue. Several plans to this end might be urged: for example, the use of a cancelling ink which by chemical combination with that used in printing the stamps would effect permanent discoloration; or the use of an ink for printing postage stamps which, while sufficiently strong to resist the ordinary wear and tear to which the stamps are subjected by their holders before use, would yet be so yielding as to give way before such solvents as would be necessary to remove the usual cancelling marks; or the use of a chemically prepared paper in the making of postage stamps, such as would discolor when cancelling inks should be applied, or when efforts should be made to remove the cancelling marks. Under any circumstances, the color of the stamps should be anti-photographic—that is, such a color or colors as will prevent counterfeiting by the aid of photography; and in this event it might be cheaper and better to print the stamps on an ordinary printing machine from electrotypes than from steel plates and by the plate-printing process. The value to the government of any good plan for preventing the counterfeiting or the fraudulent reuse of postage stamps is obvious.

13. The present system of postmarking letters should be improved. Probably over 25 per cent. of all the postmarks on letters mailed in the United States are illegible, causing at times great annoyance and inconvenience. An excellent plan has been suggested as a partial remedy for this trouble: that of having various outline forms of postmark—say a different form for every State—which, if the name of the post-office were indistinct, would assist in its identification.

14. At every place of considerable size—say at every place of 10,000 inhabitants—the government should own the post-office building; and these buildings should be erected and furnished with facilities according to carefully considered plans made upon consultation with postal experts. The result would be an ultimate saving to the government in the item of rent and the prevention of changes in the location of the post-offices; while the transaction of postal business would be expedited and rendered more accurate.

15. The method of ascertaining and fixing the compensation of postmasters should be radically changed; for, as may be seen by any one who gives the subject any consideration, the present plan offers a constant temptation to official dishonesty. The law authorizing this method requires that at what are known as fourth-class post-offices (constituting more than nineteen-twentieths of all the offices) the compensation of postmasters shall be made up mainly of commissions on postage stamps cancelled, the amount of cancellation

at an office being ascertained quarter-yearly from the postmaster's own returns, the verification of which by the auditing office at Washington is simply impracticable; at what are known as presidential offices the compensation is fixed once a year, in even hundreds or thousands of dollars, upon the basis of the gross postal revenue, as reported by the postmasters themselves, the correctness of the reports, as in the case of the fourth-class offices, it being impracticable for the auditing office to determine. The schedule of salaries at the presidential offices is as follows: Where the gross receipts are \$1900 and do not exceed \$2100, the compensation is \$1000 per annum; where the receipts are \$2100 and not over \$2400, the compensation is \$1100; where the receipts are \$2400 and not over \$2700, the compensation is \$1200; and so on through thirty grades, increasing \$100 for each grade up to the three highest, the pay of which is \$4000 per annum where the gross receipts of the office are \$450,000 and not over \$500,000; \$5000 where the gross receipts are \$500,000 and not over \$600,000; and \$6,000 where the gross receipts are in excess of \$600,000. Thus at nearly 55,000 post-offices (the department never knowing the amount of cancellation) the postmasters practically determine their own compensation; at every one of the presidential offices, about 2200 in number, the postmaster has it in his power, whenever the gross receipts approach the maximum of the grade in which for the time being his office is placed, to carry himself, either by forced sales of stamps or false returns of sales, over into a higher grade, and thus increase his compensation. The temptation to do this is very great, in view of the fact that a single dollar's increase of gross revenue may make an increase in the postmaster's compensation of either \$100 or \$1000 according to the grade he may happen to be in. The true policy would seem to be fixed compensation for long periods, or to be varied only when special examination should show an increase to be proper. (M. D.)

POSTAL UNION, UNIVERSAL. This is the name given to an association of nearly all the civilized nations of the world, formed for the purpose of regulating international postal intercourse. The credit of originating this great union (which has been of inestimable service to mankind), or rather of taking the first action that may be said to have brought about its formation, belongs to the government of the United States—the idea having been first suggested in the early part of 1862, to the head of the Post-Office Department, by Hon. John A. Kasson, then First Assistant Postmaster-General. At his request the Postmaster-General, Hon. Montgomery Blair, on Aug. 4, 1862, transmitted, through the Department of State, to the government of every country with which the United States had diplomatic intercourse, a formal invitation to participate in a congress of nations, to assemble at some convenient place in Europe, and which should consider the expediency of establishing a uniform classification and standard of weight for international mail matter, uniform rates of international postage, and uniform systems for regulating the dispatch of matter between the various countries of the world, the transit of matter from one country to another through the intermediary of a third, the registration of matter, the return of undelivered letters, and the transmission of limited amounts of money by means of international orders or drafts. Under this invitation a congress—the first international postal congress that ever assembled—convened at Paris on May 11, 1863, in which there were distinguished representatives of the postal administrations of Austria, Belgium, Costa Rica, Denmark, France, Great Britain, the Hanseatic Cities, Italy, the Netherlands, Portugal, Prussia, the Sandwich Islands, Spain, Switzerland, and the United States. Mr. Kasson represented this country. The utmost harmony and liberality of thought prevailed at the sessions of this congress, and the interchange of ideas and the discussion of principles and policy

gave a great impetus to postal progress. Thirty-one articles of agreement were formally adopted, covering all the propositions made by the United States, except that relating to a money-order system, and establishing principles that are still the basis of all international postal business. The agreement, however, not being of the nature of a formally ratified convention, did not secure a perfect union, did not establish for it a fixed duration, made no arrangements for future congresses, and failed to provide for the adhesion of other nations. The necessity for another congress, therefore, in a few years became manifest; and accordingly, by general consent of the nations represented in the first congress, a second one assembled at Berne, Switzerland, Sept. 15, 1874, and on Oct. 9 agreed to a formal convention, in which the defects of the former agreement were remedied, new provisions adopted, and a name—the "General Postal Union"—given to the association. The duration of the convention was to be not less than three years from July 1, 1875, and the territory to which it applied comprised the United States and the whole of Europe, Asiatic Turkey, Asiatic Russia, Egypt, Iceland and the Faroe Islands as a part of Denmark, the Balearic Islands, the Canaries, the Spanish possessions on the northern coast of Africa and the Spanish postal establishments on the west coast of Morocco as a part of Spain, Algeria as a part of France, Malta as a part of Great Britain, and Madeira and the Azores as a part of Portugal. On May 1, 1878, a third congress assembled at Paris, for the purpose of revising and improving the system established by the congress of Berne, and continued in session until the 4th of the next month, when a new convention was agreed upon, which was to go into effect April 1, 1879, and was to endure for an indefinite period. By this convention the name of the association was changed to the "Universal Postal Union"—by which name it is still known—and the extent of its jurisdiction was greatly enlarged. On Feb. 4, 1885, the fourth postal congress met at Lisbon, and adopted a new convention, which went into effect on April 1, 1886, and which is now in force. The next congress will assemble at Vienna in 1890, unless an earlier session is found to be necessary.

The scope and aim of the Universal Postal Union are vast and noble, and its work admirably executed. It makes a single postal territory of nearly the whole world, uniting all nations under a common idea, subjecting them to the same laws, establishing them all upon a footing of perfect equality, and making the self-interest of each give way before the interest of all. In a word, its conspicuous purpose is the good of mankind. The subjects covered by the Convention of the Postal Union are the classification of mail matter, the rates of postage, the transit of matter between the several countries of the Union, direct and through intermediaries, the charges to be made for such intermediary transit and the manner of their settlement, the reforwarding and return of mail matter, the registration of matter and the charges therefor, a system of indemnifying the owners of mail matter that may be lost, the collection of unpaid postage, and a system for the transmission of letters of declared values. Under it an International Bureau is maintained at Berne, in the Republic of Switzerland, through which, under established rules, correspondence is carried on between the several countries of the Union, relative to its general business, to the settlement of disagreements between two or more countries, to the tabulation and publication of statistics, to the admission of new members to the Union, to proposed changes during the intervals between the congresses, and to all other matters that may be of interest or benefit to the postal world. The rates of international postage as now fixed by the convention are as follows: Letters, 5 cents a half ounce if prepaid, and double this rate (to be collected on delivery of the matter) if not prepaid. Postal cards, 2 cents each. Printed matter, commercial

papers, and samples of merchandise, 1 cent for each two ounces if prepaid, and double this rate if not prepaid.

The Postal Union now comprises the following-named countries: The Argentine Republic, Austria-Hungary, Belgium, Bolivia, Brazil, British India, Bulgaria, Canada, Chili, Colombia, the Independent State of Congo, Costa Rica, Denmark and Danish colonies, Dominican Republic, Ecuador, Egypt, France and French colonies, Germany, Great Britain and British colonies (except the Australian and other Oceanian colonies), Greece, Guatemala, Hayti, Hawaiian Islands, Honduras, Italy, Japan, Liberia, Luxembourg, Mexico, Montenegro, Netherlands and Netherlands colonies, Nicaragua, Norway, Paraguay, Persia, Peru, Portugal and Portuguese colonies, Roumania, Russia, Salvador, Servia, Siam, South-west Africa, Spain and Spanish colonies, Sweden, Switzerland, Tunis, Turkey, Uruguay, and Venezuela.

For further information concerning the Postal Union, see Reports of Postmaster-General of the United States for 1862, 1863, 1874, 1875, 1878, and 1885; also the files of *L'Union Postale*, the official organ of the International Bureau at Berne, and *Documents du Congrès Postal de Lisbonne* (Berne, 1885), and to similar documents of the Congresses of Paris and Berne, published in 1874 and 1878. (M. D.)

POTASH.—The hydrated oxide of potassium, or caustic potash ($K_2O \cdot H_2O$, or, as given by many chemists, KHO), was not known as a separate substance till 1739, in which year its distinction from soda, which it resembles in general properties, was first recognized. In its pure state it is one of the most powerful basic substances known, and is largely employed in the decomposition of saline substances, whose acid combines with the potash. As existing in nature it is of the utmost importance to the growth of plants. It is prepared from the carbonate by boiling with lime, which seizes the carbonic acid and leaves the hydrate in solution. Its most important sources are the potash minerals, carnallite and sylvite, which exist abundantly in the salt mines of Stassfurt, Germany. In a single locality in these mines there is a mass of carnallite equivalent to 6,000,000 tons of chlorate of potassium. Ordinary commercial potash consists of the crude carbonate and hydrate, and is chiefly obtained from wood-ashes, which contain it in abundance. The method pursued in America is to burn large heaps of wood to ashes. These are then placed in tubs made from barrels sawn in half, and with perforated false bottoms. About 5 per cent. of lime is added, and the ashes are leached by successive applications of water, each of which is allowed to stand for an hour or two. The water is then drawn off from the bottom, the first draining being taken to the evaporating pans, while the succeeding portions are kept to use on fresh ashes. Broad, shallow iron pans are used in which the liquid is boiled till it becomes syrupy. It grows solid on cooling. The substance thus obtained is intensely alkaline. When purified by heat, which drives off the sulphur and some other impurities, it becomes of a white, bluish, or pearly cast, and is known as pearl ash. The lime used in its preparation acts to decompose the sulphate of potash, which forms one of the salts of the ashes, and frees the potash.

The growing scarcity of wood has greatly decreased the production of potash in this manner, as has also the competition of foreign potash made from the beet-root sugar waste and from the Stassfurt minerals. In 1880 the American product was 4,571,671 lbs., valued at \$232,643. Potash is a constituent of the abundant mineral felspar, which, however, holds it with such powerful affinity that it cannot be separated with sufficient cheapness. It also exists to the amount of 10 or 12 per cent. in the mineral glauconite of the cretaceous or greensand deposits of New Jersey. This is more easily decomposed than felspar, and is capable of

yielding immense quantities of potash. The greater cheapness of soda has enabled it to replace potash in most cases where an alkali is needed, but a steady demand exists for potash from its special adaptation to certain uses. Its principal uses are in the manufacture of soft soap and of several important salts of potassium. It is also used in the manufacture of glass; some of the best and most costly glasses now made, such as Bohemian white and English flint, being potash glasses. In its pure state potash is sometimes used in sticks and pencils as a cauterizing agent. (C. M.)

POTATO. See AGRICULTURE, Chap. v., 2.

POTATO BEETLE. See COLORADO POTATO BEETLE.

POTT, AUGUST FRIEDRICH (1802-1887), a German philologist, was born at Nettelrede, Hanover, Nov. 14, 1802. Early left an orphan, he was educated at Hanover and studied philology at Göttingen. In 1825 he began to teach at Celle, and two years later received the degree of Ph. D. from the University of Göttingen. In 1829 he went to Berlin, resolved to devote himself to comparative philology, and became associated with Franz Bopp, the pioneer in that department. In 1831 he was a privat-docent at the University of Berlin, and in 1833 was made professor of comparative philology in the University of Halle. His reputation was firmly established by his *Etymologische Forschungen auf dem Gebiete der indogermanischen Sprachen* (2 vols., 1833-36), which work, joined with the labors of Bopp in comparative grammar, introduced a new era in the study of language. Pott continued to revise and enlarge this work, so that it finally occupied eight volumes (1859-76), while he issued numerous volumes and essays on philological subjects. A curious by-product of his labors was his essay, *Die Zigeuner in Europa und Asien* (2 vols., 1845), in which he proved that the language of the Gypsies had originated in India. This work obtained the Volney prize from the French Academy. Other treatises of his relate to the systems of numeration by fives and twenties, to personal and family names, and to the origin of language and of the races of men. He edited Wilhelm von Humboldt's essay, *Ueber die Verschiedenheiten des menschlichen Sprachbaues*, with an introduction (2 vols., 1876). He held his professorship for fifty-four years, meantime receiving marks of honor for his profound learning. The knighthood of the order *pour le mérite* for science and art was awarded to him in 1886. In 1877 he celebrated the jubilee of his taking the doctor's degree, and in 1883 that of his entrance on his professorship. His literary activity was continued until the last. He died at Halle, May 3, 1887. His valuable library was purchased for the University of Pennsylvania.

POTTAWATTAMIES, a tribe of American Indians of the Algonquin family, were found by the French explorers in the lower peninsula of Michigan. They were scattered about in small bands, living by hunting and fishing, though they raised a little maize. The Iroquois drove them westward to Green Bay, where the French established a mission among them. By the favor of the French they increased and greatly extended their territory. They joined in Pontiac's conspiracy in 1763, but during the Revolution favored the English, and annoyed the western settlements. Their head-quarters were then on St. Joseph's River, Mich. They were included in the treaty of 1795 with Gen. Wayne, and afterwards ceded various tracts of land. Under the influence of Tecumseh they joined the British in the war of 1812, and after its close were obliged to give up their lands. In 1838 they numbered 4000, many of them being Catholics. Eventually the greater number settled in Kansas, but in the subsequent troubles of that region they suffered severely. By the treaty of 1862 they were permitted to hold lands in severalty, but the civil war produced delay in carrying out its provisions. In 1867 two-thirds accepted its terms, but its results were not uniform.

While some persons prospered others became paupers. The Prairie band, which had always been less docile, was placed on a reservation in Kansas under the care of the Society of Friends. It contains 77,358 acres, of which 30,900 are tillable, but only 3300 cultivated in 1887. The census then taken showed 474 on the reservation, and about 300 scattered in the States. The Citizens' band are mixed bloods of French descent, who live on the Sac and Fox reservation. They numbered 418 in 1887, lived in houses and cultivated small farms. A Catholic mission school has accommodations for 100 scholars, but is not well attended.

POTTER, ALONZO (1800-1865), bishop of the American Episcopal Church, was born at La Grange, Dutchess co., N. Y., July 10, 1800. After graduating at Union College in 1818 he was a tutor there and professor of mathematics and natural philosophy until 1826. In the meantime he had taken orders in the Episcopal Church in 1822, and was elected president of Geneva College in 1825. He declined this post, but accepted a call to St. Paul's Church, Boston, in 1826. In August, 1831, he returned to Union College as professor of rhetoric and natural philosophy. He married the only daughter of Rev. Eliphalet Nott, D. D., president of the college. In 1845 he was chosen and consecrated bishop of Pennsylvania. In this office he was energetic in his promotion of church work; he assisted in founding the Protestant Episcopal Hospital and the Divinity School at Philadelphia. The increase of the church necessitated the appointment of an assistant, and afterwards the division of the diocese. But before this was accomplished Bishop Potter died July 4, 1865, at San Francisco, whither he had gone on a visit. While engaged in teaching he published *Political Economy* (1841), and other textbooks. In later years besides editing *Lectures on the Evidence of Christianity* (1855) he published a *Handbook for Readers and Students* (1847), a volume of *Discourses and Charges* (1858), and *Religious Philosophy* (1853). Bishop Howe has edited his *Life* (1871).

POTTER, HORATIO (1802-1887), brother of the preceding and bishop of New York, was born at Beekman, N. Y., Feb. 9, 1802. He graduated at Union College in 1820, and became rector at Saco, Me., in 1828. In 1833 he was called to St. Peter's Church, Albany, and in 1854 he was made provisional bishop of New York. He became bishop in 1861 and discharged the duties of his office until October, 1883, when his nephew, HENRY CODMAN POTTER (b. 1835), was made assistant bishop. Bishop Horatio Potter thenceforth lived in retirement until his death, Jan. 2, 1887. His publications were sermons and charges. The present bishop has published *Sisterhoods and Deaconesses* (1871); *Gates of the East*, a book of travels (1876); *Sermons of the City* (1881).

POTTSTOWN, a borough of Pennsylvania, in Montgomery co., is on the Schuylkill River, at the mouth of Manatawny Creek, 40 miles W. N. W. of Philadelphia, with which it has connection by two railroads. It has 2 banks, 14 churches, a seminary for young ladies, an academy for boys, public schools, 2 daily and 2 weekly newspapers. The industrial works comprise iron-foundries, blast-furnaces, rolling-mills, nail-factories, and car-works. The population in 1880 was 5305.

POTTSVILLE, a city of Pennsylvania, county-seat of Schuylkill co., is on the Schuylkill River, at the mouth of Norwegian Creek, 93 miles N. W. of Philadelphia. It is the northern terminus of the Philadelphia and Reading Railroad, and from it branches extend to Tamaqua, Harrisburg, and other places. It is built on the side of steep hills. It has a court-house, town-hall, 3 national banks, 7 other banks, 20 churches, a high-school and other schools, 3 daily and 6 weekly papers, some of which are German. It is the head-quarters of the anthracite coal trade (see COAL, Vol. II.). It has several rolling-mills, iron-furnaces, found-

dries, machine-shops, saw- and planing-mills. In 1880 it had 13,253 inhabitants.

POUGHKEEPSIE, or **POKEEPSIE**, a city of New York, the seat of Dutchess co., is on the E. bank of the Hudson River, 81 miles N. of New York city, and 70 miles S. of Albany. It is on the New York Central and Hudson River Railroad, and a ferry connects it with Highland Station on the West Shore Railroad. The New York and Massachusetts Railroad also runs from Poughkeepsie 42 miles to Boston Corners where it connects with other roads. Poughkeepsie has the county buildings and offices, city library, the U. S. Government building, an opera-house, Vassar Institute, Vassar Home for Aged Men, Home for the Friendless, St. Barnabas Hospital, Old Ladies' Home, and Eastman Business College. Just beyond the eastern city limit is VASSAR COLLEGE (q. v.), a noted institution for women. It was founded in 1865 and liberally endowed by Matthew Vassar, to whose generosity the city owes also other institutions. Two miles north of the city is the Hudson River State Hospital for the Insane, erected in 1871, and costing \$750,000. Poughkeepsie has 6 national banks, 1 savings-bank, 3 large hotels, 18 churches, 12 public school buildings, 3 daily and 4 weekly newspapers, besides several periodicals. It has a blast-furnace, rolling-mill, and several breweries. The manufactures comprise silk, boots and shoes, clothing, carriages, iron-ware, etc. The town was settled by the Dutch about 1680. In 1778 the State Legislature met here, and in 1788 the New York Convention here ratified the Federal Constitution. Poughkeepsie was incorporated as a city in 1854. It is on a plateau about 200 feet above the river and is sheltered on the east by high hills. It is laid out with wide streets crossing at right angles. Main street, which extends eastward from the river, is about two miles long. The population in 1880 was 20,207.

The Poughkeepsie Railroad bridge was commenced in 1873, by a company which had obtained from the Legislature a charter, which permitted it to place four piers in the channel of the river. The work was interrupted and remained in a very incomplete state until 1886, when it was resumed and pushed forward that the bridge might be opened for traffic in 1889. The bridge is 3094 feet in length from anchorage to anchorage, and the approaches consist of a viaduct of about 3000 feet in length on the east side and about 1000 feet on the west, making the whole about 7100 feet. The bridge proper rests on 6 piers, 1 on either shore and 4 in the channel. The river piers are carried down to depths of from 125 to 135 feet below the surface. In order to secure a solid foundation open caissons of timber were built 60 feet wide by 100 long, weighted by "pockets" filled with concrete, and sunk by dredging through the open spaces, 12 in number in each caisson. This method, never before used on a large scale, proved entirely successful, the caissons having been sunk by pneumatic caissons, such as were used in the St. Louis and Brooklyn bridges, and with much less danger and expense. As the caissons were sunk they were built up by additions to the top, so that the lower edges rest upon the solid stratum underlying the mud and silt at the bottom of the river. The tops of the caissons are about 20 feet below the surface. The open spaces were then filled with concrete, the top levelled and a solid platform of timber placed upon it, and the masonry built on this. The masonry piers, which are all that show above the water, are 80 feet long each by 25 wide, the length being in the direction of the current, and they are built up to a height of 30 feet above the surface. Upon the piers are erected steel towers 100 feet high, making the height from the water to the under side of the trusses 130 feet. There are 2 rectangular steel truss spans, each of 525 feet and 80 feet high. The 3 other spans are cantilevers, the cantilever arms being 160 feet each and the connecting trusses 212 feet; the height of the connect-

ing trusses is 162 feet from the water surface, and the height of the rail on the top 212 feet. The cantilevers extending from the river piers are counterbalanced by the rectangular trusses, and those on the shore piers by inshore arms, each 200 feet long, attached to the anchorages. About 15,000 tons of steel and over 6000 tons of iron were used. The bridge is calculated to hold with entire safety 2 continuous trains of 85-ton locomotives, covering the whole length of both tracks, the ultimate strength of materials being equal to 5 times this strain. The bridge is intended to furnish a short route between the anthracite coal regions of Pennsylvania and the manufactories of New England. (F. G. M.)

POUJOULAT, JEAN JOSEPH FRANÇOIS (1800-1880) French historian, was born at Fare, Jan. 26, 1800. He was educated at Aix and went to Paris in 1826, where he joined Michaud in preparing the *History of the Crusades*. Together they visited the East and explored especially Syria. These travels were reported in their *Correspondance d'Orient* (7 vols., 1833-35), to which Poujoulat added a romance, *La Belouine* (2 vols., 1835), which was crowned by the Academy. The two historians published also a valuable collection of documents relating to French history from the thirteenth to the end of the eighteenth century (32 vols., 1836-38). A joint visit to Italy gave opportunity for another volume of correspondence, *Toscane et Rome* (1839). After the death of Michaud, Poujoulat issued a new edition of his *History* with a preliminary sketch of his life (6 vols., 1840-48). For the remaining half of his life Poujoulat labored alone but with undiminished activity. Among his works are *Histoire de Jérusalem* (2 vols., 1841-42); *Histoire de Saint Augustin* (3 vols., 1844), which also was crowned by the Academy; *Voyage en Algérie* (2 vols., 1846); *Histoire de la Revolution française* (2 vols., 1847); *Histoire de France depuis 1814* (4 vols., 1865-67); biographies of Cardinal Maury, Archbishop Sibour, Father Ravignan, and various collections of essays, literary and political. In 1848 Poujoulat was elected to the Constituent Assembly, and afterwards to the Legislative Assembly, in which he took part with the Right, or conservative party. Under the Empire he was engaged only in literary work, though he published some pamphlets on the clerical side of controverted questions. One of his latest publications was *Les Folies de ce temps en matière de religion* (1877). He died at Paris, Jan. 5, 1880.

POULTRY. See FOWL.

POURTALES, LOUIS FRANÇOIS DE, COUNT (1833-1880), naturalist, was born at Neuchâtel, Switzerland, March 4, 1833. He was educated as a civil-engineer and followed Prof. Louis Agassiz to America. He served in the U. S. Coast Survey and obtained a high reputation by his papers on the physical geography of the Caribbean Sea and the Gulf Stream. He was also associated with Agassiz in the study of natural history, and in 1873 succeeded him as keeper of the Museum of Comparative Zoölogy at Cambridge, Mass. He died at Beverly, Mass., July 20, 1880.

POWDERLY, TERENCE VINCENT, labor-organizer, was born at Carbondale, Pa., Jan. 22, 1849. His parents were Irish Catholic immigrants and had nine children. After attending school six years, Terence at the age of 13 began to work on a railroad; at 17 he entered a machine-shop and at 19 removed to Scranton, where he became a member of the Machinists' and Blacksmiths' Union. He was soon made secretary of the union and so remained till 1880. In 1873, being discharged on account of his connection with this union, he sought employment in Ohio and at Oil City. He was delegate to the International Union at Louisville in September, 1874, and organized assemblies of the Industrial Brotherhood near Pittsburg. Returning to Scranton he joined the Knights of Labor, and was made secretary of the District Assembly. He was then foreman in locomotive works. The Groenback-

Labor party enlisted his energies and being nominated by it for mayor of Scranton in 1877 he was elected by 531 majority. He was re-elected in 1878, but declined a third term in 1879 when he was made General Master Workman of the Knights of Labor at their Convention in Chicago. In 1881 he urged upon the Knights the abolition of the oaths and the removal of the obligation of secrecy, which was finally accomplished. In 1886 the Knights had 160 District Assemblies, 9000 districts, and 730,000 members; but at the convention at Indianapolis in November, 1888, their total was admitted to be less than 500,000. The constitution adopted in 1878 has been revised at nearly every annual meeting, but Mr. Powderly has been steadily re-elected, although his health has been impaired by devotion to his work. There has been considerable opposition to his policy within the order; the disaffected elements have, however, been steadily overruled, and many have withdrawn on this account.

POWELL, BADEN (1796-1860), an English natural philosopher, was born at Stamford Hill, near London, Aug. 22, 1796. He graduated at Oriel College, Oxford, in 1817, and became Savilian professor of geometry at Oxford in 1827. For many years he was one of a small band at Oxford who kept alive the study of physical sciences when they were regarded with little favor. In 1850, as a member of the Oxford University Commission, he assisted in introducing some modifications which gave those sciences a recognized place in the system of study. He died at London, June 11, 1860. Besides purely scientific treatises he wrote chiefly on the connection between natural science and theology. His principal works are *Historical View of the Physical and Mathematical Sciences* (1834); *Connection of Natural and Divine Truth* (1838); *Christianity without Judaism* (1857); *The Order of Nature considered in Reference to the Claims of Revelation* (1859). To the *Essays and Reviews* (1860) he contributed an essay "On the Study of the Evidences of Christianity."

POWELL, JOHN WESLEY, geologist and anthropologist, was born at Mt. Morris, N. Y., March 24, 1834. The son of a Methodist preacher, he was in early life taken to Wisconsin and Illinois, where he received a common school education and became a teacher. Being also an ardent student of natural history, he gathered specimens for many institutions of learning. Meantime he pursued for two years a special course at Oberlin College, Ohio. In his scientific excursions he descended the Mississippi River in a skiff, and the Ohio in a rowboat. In 1861 he entered the Union army as a private but soon rose to a captaincy. At the battle of Shiloh he lost his right arm, but on his recovery went to the front and was engaged in the Vicksburg and Atlanta campaigns, becoming major of artillery. In 1865 he was made professor of geology in the Wesleyan University, Bloomington, Ill., but this position was soon exchanged for a similar one in the Illinois Normal University. In connection with his college work he undertook in 1867 a scientific exploration of Colorado Territory. This work obtained the attention of the national government, and in 1870 under the authority of Congress he was engaged to explore the region of the Colorado River and its tributaries. During these investigations he became interested in the ancient cities of the Moquis and entered upon ethnological researches, which have greatly affected his subsequent career. In 1879 when the various government surveys of the Territories were consolidated, as he had advised, Major Powell was made director of the bureau of ethnology. In 1881 he became director of the U. S. Geological Survey. This work he has greatly enlarged and thoroughly classified, originating plans for its prosecution, and employing experts where their services were most valuable. Among his reports are *Exploration of the Colorado River* (1874); *Geology of the Uinta Mountains* (1876); *Lands of the Arid Region of the United States* (1879); *Method of Sur-*

veying the Public Domain; Organization and Plan of the U. S. Geological Survey. The Reports of the Bureau of Ethnology include *Contributions to North American Ethnology*, *Outlines of the Philosophy of the N. A. Indians*. Other contributions to anthropology are an address on *Mythologic Philosophy* (1875) and *Wyandotte Government*, a study of tribal society. Maj. Powell has been president of the Anthropological Society of Washington since its organization in 1879, and as such has delivered addresses on *Outlines of Sociology* (1882); *Philosophic Bearings of Darwinism* (1883); *Three Methods of Evolution* (1884); *Human Evolution* (1884); *From Savagery to Barbarism* (1885); *From Barbarism to Civilization* (1886); *Evolution of Civilized Man* (1888). Major Powell in 1886 received the degree of Ph.D. from Heidelberg University, Germany, and of LL.D. from Harvard University. In 1887 he was chosen president of the American Association for the Advancement of Science.

PRAIRIE. This term in the French language signifies "a meadow," and takes its derivation from a mediæval Latin *prataria*, a variant of the classical Latin *pratium*, "a field." Its application as the name of an extended plain dates from the planting of the early French settlements in the Mississippi Valley, a large part of whose floor is of a true prairie formation. There is some looseness about the use of the name. In general, a prairie is supposed to be treeless, at least by nature; but in some of the Southern States a flat region of a forest-character is called a "timbered prairie," while a treeless plain of the same district is called a "bald prairie." So in the Gulf States there are what are called *prairies tremblantes*, or "quaking prairies," the surface of which shakes beneath the tread of a person crossing them. Here the tough sward may support herds of cattle, and the unstable plain may even be crossed by lines of railway; yet it would seem that the strata beneath must be of a semi-liquid character. But the true and representative prairies are the great plains of the upper half of the Mississippi Valley, with their extensions northward into Canadian territory, and south-westward to the Gulf and the Rio Grande. It is usual to discriminate between the prairies and the upper plains which skirt the eastern flank of the Rocky Mountains; yet the distinction is in the main arbitrary, for no line of demarcation can be drawn between the prairies and the high sub-Alpine plain. It is certain that very considerable areas of the great prairie-region at one time (and that not very remote, from a geological point of view) were lake-beds, or were the basins of shallow seas. This is proved by abundant and highly characteristic fossil remains. It is possible that, as more than one geologist has asserted, the peculiar fineness of the slowly deposited silt, which has now become a soil, is unfavorable to tree-growth. Another view, and a very reasonable one, is, that the prevalence of great annual prairie-fires, which, in the dense foggage which covers the natural prairie, burn with great intensity, has done much to repress forest growth. Certain it is that almost the only native arboreal growth (and that of few species) is to be found along the water-courses. But at present the prairie fires are limited in range and intensity; and almost everywhere belts of young native or self-planted forest are seen springing up, especially in those regions where the rainfall is considerable. Besides this, in no other part of the United States has the planting of forest trees been undertaken upon so large a scale as in the prairie-regions west of the Mississippi, arboriculture having been stimulated by State and Federal legislation. But the final success of much of this tree-planting is still undecided. It is possible that some drought of exceptional length and severity may yet give a great check to this matter of tree-planting. The climate of the prairie-regions, especially towards the mountains on the west, has its drawbacks, such as the tremendous violence of the winds, the scanty rainfall, and the occasional intensity of the winter's cold.

As to whether the dryness of the climate is being lessened by tree-planting and agriculture, opinions differ widely. But the weight of scientific opinion is certainly against the idea that the planting of trees will very materially increase the fall of rain, although the popular view asserts that such an increase has already taken place. That trees by shading the soil make the process of evaporation a slow one is certain. The extension of agriculture also makes the soil more permeable by rains, and thus stores up moisture in it, and the introduction of great systems of irrigation-canals, such as may be seen in Colorado, tends to a similar result.

A comparatively limited part of the true prairie-region is of a dead-level character, though such tracts are not unknown. But most of the prairies have a "rolling" or wavy surface, broken in some parts by "sloughs" or muddy depressions; in others by *coulées*, or dried-up water-courses, which somewhat resemble the *wadies* of Arabia. Elsewhere there are low ridges of sandy or flinty nature, and even considerable areas of soft and wind-worn rock, with deep "draws" or ravines, which furnish good winter harborage for cattle. But these are exceptional.

The prairies are the great grazing region of the United States. The varieties of their grasses are fully described in Section III. of the article on FORAGE CROPS. Two of their most remarkable animals are fully described under ANTELOPE, AMERICAN (also called Pronghorn) and BISONS (commonly called Buffalo). See also GOPHER, etc. (C. W. G.)

PRAYER. Man has always looked up to a superior power, and has sought its favor or deprecated its anger. That power might be considered as resident in one God or in many gods, but the most barbarous nations have recognized the power and bowed before it. That communication could be had with the divine power was instinctive in the race, and some form of worship (however crude) marked every community. Part of that worship was prayer, the speaking of the worshipper to the deity. It took the form of doxology or supplication, and was generally accompanied with sacrificial rites.

Revelation has made this instinctive principle a clear privilege and duty, and has exhibited its philosophical connection with man's position before God. It is thus shown to be the expression of the heart's faith, receiving all its value from the truth of that faith, that it is not a mere form of words, nor a mere external ritual, but a spiritual action, and that all approaches to God without the interest of the heart are abhorrent to him. Our Lord, in teaching his disciples to pray, gave as the subjects of prayer God's glory upon the earth and our own supply, forgiveness and deliverance from sin. Under the head of our own supply earthly blessings may be considered as appropriate subjects of prayer, but the large preponderance of the other petitions clearly show that earthly blessings should be held in subordination to the spiritual wants of the soul and the world.

Warrant may be found in the Holy Scriptures for either extemporaneous or prepared prayer in public worship. The prayer offered by the church for Peter when he had been seized by Herod (Acts xii. 5) was certainly extemporaneous, while the prayer offered by the church on the deliverance of Peter and John (Acts iv. 24) must have been prepared and learned, or at least uttered by a leader and repeated by the assembly. In no other way can we explain the words "they lifted up their voice to God with one accord and said."

The Christian church has used liturgies in all her history, but not to the exclusion of extemporaneous prayer. (H. C.)

PREBLE, EDWARD (1761-1807), commodore, was born on the present site of Portland, Me., Aug. 15, 1761. His father, Jedidiah Preble (1707-84), was an early settler of that place, a brigadier-general in colonial times, and afterwards a judge and State senator

of Massachusetts. Early in the Revolutionary war Edward had sailed in a privateer, and in 1779 he entered the Massachusetts navy as a midshipman. In the Penobscot expedition he was captured and was confined in the Jersey prisonship at New York. After his liberation he gained distinction by his daring capture of a British brig at Castine, Me. Peace being declared he entered the merchant service, but in 1799, when the navy was reorganized, he was made lieutenant. Soon promoted captain, he had command of the frigate *Essex* (36 guns) sent to protect American commerce in the East Indies. In 1803 he was assigned to the command of the fleet sent against Tripoli. Arriving at Tangiers in October he succeeded in averting a war with Morocco. In November he blockaded the port of Tripoli. Here lay the captured ship *Philadelphia*, which was destroyed by the gallant *Decatur* Feb. 16, 1804. In August Com. Preble began a series of attacks on the Tripolitan galleys and gunboats, which were protected by batteries on the shore. Though he inflicted much damage his own losses were serious, and on Sept. 4 a powder-ship intended to destroy the enemy's fleet was blown up by a shot from the shore. On Sept. 10 Com. Preble was relieved by Com. Barron and returned to the United States. He died at Portland Aug. 25, 1807.

His nephew, **GEORGE HENRY PREBLE** (1816-1885), rear-admiral, was the son of Capt. Enoch Preble, and was born Feb. 25, 1816. He entered the U. S. navy in 1835, served in the Seminole war in 1841, and on the coast of Mexico in 1847. While commanding the sloop *Macedonian* in 1854 he was sent to punish the Chinese pirates, and in July and August, 1855, he destroyed five of their junks. During the civil war he was engaged in the blockade of the Gulf coast, assisted in the capture of New Orleans, and from 1863 took part in the South Atlantic blockade, sometimes also fighting on shore. He attained the rank of rear-admiral. He died at Brooklyn, Mass., March, 1885. His publications were a *Genealogy of the Preble Family* (1868); *History of the American Flag* (1872; afterwards enlarged; last ed., 1883); and a *History of Steam Navigation* (1884). He contributed the article on FLAG, AMERICAN, to this work.

His cousin, **WILLIAM PITT PREBLE** (1783-1857), was a leader of the Democratic party in Maine, and influential in framing the State constitution in 1819. On the organization of the State government in 1820 he was made a judge of its Supreme Court, and in 1829 he went as U. S. minister to the Netherlands.

PRENTICE, GEORGE DENISON (1802-1870), journalist, was born at Preston, Conn., Dec. 18, 1802. He was educated at Brown University, trained for the law, but destined to be a newspaper editor. In 1828 he established a literary paper at Hartford, Conn., in which many of his own poems, serious and sentimental, appeared. In 1830 he removed to Louisville, Ky., and became editor of the *Journal*, with which his name is constantly associated. His bright wit and sparkling paragraphs made the paper a daily favorite with the people. It formed a connecting link between the poetical, aristocratic South and the practical, progressive West. Prentice was a gallant supporter of Henry Clay, and a firm opponent of secession. When the civil war came his paper, like the State in which he presided, suffered severely. In his later years he gave up the ownership of the *Journal*, though he still contributed to its columns. He died at Louisville, Jan. 22, 1870. From his writings was collected *Prenticeana, or Wit and Humor in Paragraphs* (1860). His poems were never collected in a volume, though specimens may be found in various works.

PRENTISS, GEORGE LEWIS, Presbyterian minister, was born at Gorham, Me., May 12, 1816. He graduated at Bowdoin College in 1835, and studied theology at the Universities of Halle and Berlin. He was pastor of a Congregational church at New Bedford, 1845-51, and of a Presbyterian church in New

York city, 1851-58. He then resigned on account of ill health, and spent two years in Europe. After his return he was pastor of the Church of the Covenant, New York, until 1873, when he became professor of pastoral theology in Union Theological Seminary. Besides sermons he has published memoirs of his brother and his wife.

His wife, ELIZABETH PAYSON PRENTISS (1818-1878), was the daughter of Rev. Edward Payson (*q. v.*), and exhibited the same amiable disposition and fervent piety. She was born at Portland, Maine, Oct. 26, 1818, and in early life was a teacher. She was married in 1845, and after the early death of her children began to write for publication. After some books for children, she gained a wider circle of readers by *Fred, Maria and Me* (1868). But the most marked product of her pen was *Stepping Heavenward* (1869), which has been translated into several languages. Her other books were *Home at Greylock* (1876); *Pennauquil* (1877). She died at Dorset, Vt., Aug. 13, 1878.

His brother, SERGEANT SMITH PRENTISS (1808-1850), noted as an orator, was born at Portland, Me., Sept. 30, 1808. After graduating at Bowdoin College in 1826, he went to Mississippi as a teacher, and there studied law, and was admitted to the bar in 1829. His eloquence gave him success from the start. In 1832 he moved to Vicksburg and won a suit involving title to the most valuable part of the city. The ground which he obtained as his fee made him one of the wealthiest men of Mississippi. He was elected to the State Legislature in 1835, and was Whig candidate for Congress in 1837. His rival, Col. Claiborne, obtained the certificate of election, but Prentiss carried the contest to Washington, and in support of his claim delivered a remarkable speech before the House of Representatives. By the casting vote of the Speaker, James K. Polk, the case was decided against him. Prentiss then returned to Mississippi and entered upon an earnest canvass, after which he was returned to the House by an overwhelming vote. He was, however, embarrassed by the financial troubles of 1837, and served but one term in Congress. After Mississippi repudiated her State bonds, Prentiss, who had earnestly opposed this action, removed to New Orleans in 1845. There he was leader of the bar, and prominent in philanthropic work. He died at Longwood, near Natchez, July 1, 1850. See *Memoir of Sergeant S. Prentiss*, by his brother (2 vols., 1855; new ed., 1879).

PRESBYTERIAN CHURCH. The ENCYCLOPÆDIA BRITANNICA gives not only a full statement of the system of Christian faith and church government known as

Presbyterianism, and a history of its progress in Europe, but also an excellent sketch of its introduction and growth in America. The latter part of the article was prepared by Prof. Charles A. Briggs, D.D., and needs only such additions as may bring its statements down to the present time.

"The Presbyterian Church in the United States of America" is the official title of the largest body holding this system of church government. Its present organization dates from Nov. 12, 1869, when the two bodies which had been known as the "Old School" and "New School" since 1837 accepted a plan of union "on the doctrinal and ecclesiastical basis of our common standards." This reunion was the outcome of fraternal feeling, revived and nurtured by joint evangelistic labors during the civil war, especially in the work of the U. S. Christian Commission (*q. v.*). The strength and tendency of this feeling were plainly exhibited at St. Louis in 1866, where the two Assemblies participated in the sacrament of the Lord's Supper. In 1867 a further step was taken when a national Presbyterian convention was held in Philadelphia, over which Mr. George H. Stuart (*q. v.*), who had been president of the U. S. Christian Commission, was called to preside. Although this convention failed of its

grander purpose—the organic union of all American Presbyterians—it was the first practical movement towards the reunion accomplished two years later. The outcome of the friendly discussions of the joint convention needed only to be formulated to be accepted by the churches at large. When this was accomplished the popular rejoicing over the reunion was manifested in raising a memorial fund amounting to \$7,883,984. This fund was chiefly expended in paying church debts and building new churches. In 1871 the Assembly, under the leadership of Rev. Dr. James McCosh, undertook a scheme of ministerial sustentation for the purpose of increasing the salaries of pastors to \$1000 per annum, but in a few years this work was transferred to the Board of Home Missions. A committee on Systematic Beneficence was appointed in 1879, and a committee on Temperance in 1881. A Board of Aid for colleges and academies was established in 1883. The other Boards through which most of the benevolent and missionary work of the church is transacted are of older date, as follows: Board of Home Missions, organized in 1816; Education, 1819; Foreign Missions, 1837; Publication, 1838; Church Erection, 1844; Ministerial Relief, 1855; Freedmen, 1865.

The reports made to the General Assembly in May, 1888, for the year preceding, give the following statistics: Synods, 26; Presbyteries, 202; ministers, 5789; churches, 6543; elders, 22,434; deacons, 7210; communicants, 722,071; Sunday-school membership, 793,442. The receipts for home missions were \$844,696; foreign missions, \$743,495; other general objects, \$602,441; ministerial relief, \$525,555; the contributions to the last-named being intended as a centennial thank-offering. The total receipts for all purposes were \$12,817,783.

"The Presbyterian Church in the United States" is the official title of the body commonly distinguished as the Southern Presbyterian Church, being composed chiefly of ministers and churches in the Southern States. Its organization was effected in 1861, and was due to the separation produced by the civil war. It took its present name in 1865, and in 1886 celebrated its quarter-centennial. The reports made to its General Assembly in May, 1888, for the year preceding, gave the following statistics:—Synods, 13; Presbyteries, 68; ministers, 1129; churches, 2280; elders, 7110; deacons, 5228; communicants, 156,249; Sunday-school membership, 113,901. The receipts for foreign missions were \$73,389; education, \$35,226; and the total for all purposes, \$1,463,473.

These two General Assemblies, distinguished as Northern and Southern, established a system of correspondence in 1882, and in the next year appointed fraternal delegates to each other. In 1885 they agreed upon a joint celebration of the centennial of the original General Assembly, which was accordingly held with great enthusiasm on May 24, 1888, in Philadelphia. The *Addresses* delivered at the several sessions of this celebration by distinguished representatives of both churches have been published.

Committees were appointed by both Assemblies in 1887 to report on the practicability of reunion between these bodies holding a common faith and polity. The report, however, when presented to the Assemblies, encountered some opposition, especially in the Southern church.

For other Presbyterian churches in America see their respective titles. (J. P. L.)

PRESCOTT, WILLIAM (1726-1795), colonel, was born at Groton, Mass., Feb. 20, 1726. He was of the fourth generation from John Prescott, a native of Lincolnshire, England, who settled at Lancaster, Mass. William's first military service was at the capture of Cape Breton in 1754, and his next in the expedition against Acadia in 1756. He had large estates at Pepperell, Mass., and held local offices. In 1774 he was appointed colonel of minute-men, and in the following April he led his regiment to Lexington and then joined

the army at Cambridge. On June 16 he was ordered to throw up defences on Bunker's Hill, and, though the work was done on Breed's Hill, the battle that ensued is known by the former name. (See BUNKER'S HILL.) Col. Prescott had the command throughout and was one of the last to leave the intrenchments. He resigned in 1777, but afterwards joined Gen. Gates's army as a volunteer and was present at Burgoyne's surrender. He was for many years a member of the Massachusetts Legislature. He died Oct. 13, 1795.

His brother, OLIVER PRESCOTT (1731-1804), graduated at Harvard College in 1750 and became a physician. In 1776 he was made brigadier-general of militia and in 1777 he was elected to the supreme executive council of the State. From 1779 till his death he was a judge of probate for Middlesex county. He was active in suppressing Shays's Rebellion.

PRESCOTT, WILLIAM (1762-1844), the son of Col. William Prescott, was a noted lawyer, served in the Massachusetts Legislature and in the governor's council, and was a delegate to the Hartford Convention of 1814. Though twice offered a seat on the bench of the State Supreme Court he declined, but he served as judge of common pleas for Suffolk county. He was the father of the historian WILLIAM HICKLING PRESCOTT (1796-1859), for whom see the *ENCYCLOPÆDIA BRITANNICA*.

PRESENSE, EDMOND DÉHOULT DE, a French theologian and senator, was born at Paris, Jan. 7, 1824. He studied theology at Lausanne under Vinet, and also at Halle and Berlin. In 1847 he was ordained pastor of the Evangelical Free Church in the Taitbout Chapel at Paris and soon after was made professor in the Free School of Theological Science. He gained high reputation as a pulpit orator and soon devoted himself energetically to the advocacy of the entire separation of church and state. In 1863 the University of Breslau conferred on him the degree of D. D. In 1871 he was elected to the Chamber of Deputies, and during his five years' service voted constantly with the Republican party. In 1883 he was made a life-senator. He is a chevalier of the Legion of Honor. Of his numerous works may be noted *Christianisme dans son application aux questions sociales* (1849); *Le Rédempteur* (1854); *Les trois premiers siècles de l'Eglise chrétienne* (4 vols., 1858-77); *L'Eglise et la Revolution française* (1864); *Jésus-Christ, son temps, sa vie, son œuvre* (1866); *Le Concile du Vatican* (1872); *La Liberté religieuse en Europe* (1874); *Études contemporaines* (1880); *Les Origines* (1882); *Variétés morales et politiques* (1885). He founded the *Revue chrétienne* in 1854 and the *Bulletin théologique*. Several of his works have been translated into English by Annie Harwood.

His wife, ELISE F. DE PRESENSE, born in Switzerland in 1826, has published several religious stories, including *Rosa* (1858); *Le Journal de Thérèse* (1854); *Bois-Gentil* (1878).

PRESTON, WILLIAM CAMPBELL (1794-1860), statesman, was born at Philadelphia, Dec. 27, 1794. His father, Francis Preston (1766-1835), was then a member of Congress from Virginia. The son studied law with William Wirt at Richmond, and travelled in Europe from 1816 to 1819. He was admitted to the bar at Richmond, but removed to Columbia, S. C., in 1822, and two years later was elected to Congress. He was a leading advocate of free trade and nullification. In the U. S. Senate from 1834 to 1842 he was one of the noted orators. His style was ornate and his elocution graceful. In 1845 he was made president of South Carolina College, and after filling this position with honor for six years he retired on account of ill health. He died at Columbia, May 22, 1860.

His brother, JOHN SMITH PRESTON (1809-1881), was educated at Hampden-Sidney College and at the University of Virginia and studied in the Law School of Harvard College. He married a daughter of Gen. Wade Hampton, of South Carolina, in 1830 and took

part in the nullification movement. He was a member of the South Carolina Legislature from 1848 to 1856, and became noted as a speaker. In February, 1861, he went as a commissioner to Virginia to urge immediate secession. His speech before the Virginia Legislature at that time was his most noted and brilliant effort. During the civil war he served first on the staff of Gen. Beauregard, taking part in the battle of Bull Run, and afterwards was brigadier-general with charge of the conscript department. After the war he went to Europe, where he remained several years. After his return in some notable occasions he delivered addresses in which he maintained with vigor and eloquence the right of secession. He died at Columbia, S. C., May 1, 1881. He was a highly cultivated gentleman and a liberal patron of art.

JAMES PATTON PRESTON (1774-1843), uncle of the preceding, was a colonel in the U. S. army and was wounded in Canada during the war of 1812. He was afterwards governor of Virginia, 1816-19, and State senator. His son, WILLIAM BALLARD PRESTON (1805-1862), was a lawyer and served in Congress as a Whig. He was secretary of the navy under Pres. Taylor and in 1858 went to France to promote the establishment of a French line of steamers to Norfolk. He took part in the Virginia convention in 1861, at first strongly opposing secession, but finally acquiescing. He was afterwards a member of the Confederate Senate till his death.

PREVENTION OF CRUELTY TO ANIMALS. "The American Society for the Prevention of Cruelty to Animals," of the State of New York, the first institution of its kind ever organized in America, was incorporated by an act of the Legislature of the State of New York, passed April 10, 1866. Its founder was Henry Bergh, whose career has been sketched in Vol. I. of this work.

While engaged in his duties as Secretary of the American Legation to Russia, 1862-64, he was much pained at witnessing the brutality of the drivers of the Russian conveyances to their animals, and in several instances interfered in their behalf. Passing through England, on his return homeward, he examined the methods of the Royal S. P. C. A. in London and determined to found a similar institution in New York. Soon after his return home he entered with zeal upon his humane work. He at first solicited the support of prominent citizens and called a meeting, at which officers of the society were elected. Then he applied to the State Legislature for the enactment of laws for the protection of animals, and also for the grant of a charter for the institution. Having secured these, he attacked the problem of obtaining for dumb creatures a proper degree of consideration for their comfort. At first his efforts met with much opposition from the cruel and ridicule from the thoughtless. Nevertheless, he persevered, and by continued efforts, in which at times he personally arrested offenders, he succeeded in winning public commendation for the cause to which he had devoted his services.

In 1871 Louis Bonard, a man of humane and generous nature, died, bequeathing his entire fortune to the society, which placed it on sound basis financially. Since that period numerous other contributions have been received by it, and its power for good largely augmented. The building at the S. E. corner of Fourth avenue and Twenty-second street, in the city of New York, was purchased and altered to adapt it to the purposes of the institution, and the work of reform was proceeded with on a larger scale.

Every form of unnecessary pain inflicted upon animals comes under its supervision. Dog-fighting, cock-fighting, the use of lame, sore, weak, or disabled animals, violent beating, or needless abuse of these creatures, are a few of many kinds of cruelty suppressed by it. It has a regularly uniformed force of officers in New York city and Brooklyn, branch agencies in many counties, and agents in nearly every county in the State

of New York. An important feature of its work is the adoption of a system of transportation for disabled animals in ambulances, in which they can be placed with little discomfort and conveyed to proper places for treatment. Two of these are almost constantly in use in New York city, and one in Brooklyn. A derrick for raising animals out of excavations into which they have fallen is also provided. The society has taken an active part in the erection of numerous drinking-fountains to provide water for men and animals.

Other States have adopted its example, and passed laws for the protection of animals, until at this date 44 societies exist in North and South America, 33 of which are in the United States, all of which have adopted its emblem.

The following table shows, in a condensed form, what has been done during the twenty-two years, 1866-87:

Cases prosecuted in the courts.....	13,850
Disabled animals temporarily suspended from work.....	35,108
Horses, disabled past recovery, humanely destroyed.....	24,099
Disabled horses removed from the streets in the ambulances.....	4,444

The aggregate result for the year 1887 was as follows:

Cases prosecuted in the courts.....	797
Disabled animals temporarily suspended from work.....	3,456
Horses, disabled past recovery, humanely destroyed.....	2,546
Small animals, disabled past recovery, humanely destroyed.....	1,202
Disabled horses removed from the streets in the ambulances.....	522
Complaints received and investigated.....	3,773

Henry Bergh remained its president from the date of its organization until his death, which occurred on March 12, 1888. His nephew, Henry Bergh, was then chosen to succeed him. (E. B.)

PRICE, ELI KIRK (1797-1884), lawyer, was born at East Bradford, Chester co., Pa., July 20, 1797. He was descended from Philip Price, one of the Welsh Quakers who came to Pennsylvania with William Penn in 1682. He was educated at the Friends' School at Westtown, and entered on a mercantile career, but soon turned to the study of law under John Sergeant. Devoting himself chiefly to real estate practice, he became the most eminent lawyer in that branch in Philadelphia. Taught by his experience, he prepared for the Legislature of Pennsylvania drafts of many important acts regulating the holding and transfer of real estate by corporations and individuals. They tended to promote security of title and the welfare of the community by keeping up the improvement of real estate. To him especially was due the act of 1854 by which the various districts of the county of Philadelphia were consolidated into one city. Later labors helped to obtain for that city the land now forming Fairmount Park and to secure within it the holding of the Centennial Exhibition of 1876. After a long, useful, and honored life he died Nov. 15, 1884. He published a few legal treatises, the most important being *The Law of Limitations and Liens against Real Estate* (1857).

PRICE, STERLING (1809-1867), a Confederate general, was born in Prince Edward co., Va., Sept. 14, 1809. He removed to Missouri in 1830, and after service in the State Legislature was elected to Congress in 1845. In the Mexican war he led a Missouri regiment to New Mexico, and was made brigadier-general and military-governor of Chihuahua. He was governor of the State of Missouri from 1853 to 1857. He was a strong advocate of secession, and presided at the State convention of February, 1861. Gov. Claiborne F. Jackson appointed Price major-general of the State

militia, but their efforts to withdraw the State from the Union were baffled by the patriotic energy of F. P. Blair and Gen. N. Lyon, who compelled the State guard at St. Louis to surrender. Price retired to Carthage and gathered an army of 9000 men. Being joined by Gen. Ben. McCulloch, who had brought 3000 from Arkansas, he defeated and killed Lyon at Wilson's Creek Aug. 10. Price, marching to Lexington, Mo., captured 3000 Union men, and then retreated to Arkansas. In March, 1862, he was appointed major-general, and he fought at Pea Ridge and Corinth. He held command of the department of Arkansas in 1863-64, and then joined with C. L. Vandigham and other Northern opponents of the war in forming a secret society called "Knights of the Golden Circle." Price was the "Grand Commander" of this order, and invaded Missouri in September, 1864, expecting to gather an army of knights as he advanced, but his expectations were not realized. Though he reached Jefferson City, he was obliged to flee, closely pursued by Gens. Pleasanton and Curtis. After the close of the war Price went to Mexico and obtained some favor from the Emperor Maximilian, but, on the overthrow of the latter, Price returned to St. Louis, and died Sept. 27, 1867.

PRIESTS. Prof. W. Robertson Smith, in his article See Vol. XIX. on PRIESTS in the *ENCYCLOPÆDIA BRITANNICA*, prefaces his account of p. 724 (p. 743 the Hebrew priesthood by a general description of what he calls the priest-

hood of "the pure Semites," that is to say, of "the ancient Arabs." From what he says the casual reader would be likely to infer that we have some authentic and independent information concerning the practices of "the ancient Arabs," who lived before the beginning of Israelite history. Of course the author did not intend to convey any such impression. No one knows better than he that the alleged facts he presents are derived either from literature and traditions later than the Mohammedan era—say from eight hundred to a thousand or more years later than the latest Old Testament books—or, by processes of pretty remote inference, from incidental notices in earlier literature, the Old Testament itself being the most ancient and most fruitful source of these notices. Evidently, therefore, whatever the value of these views as to the priesthood of the early Semites may be, they can have no very great weight as evidence concerning the Old Testament priesthood. Especially, they have not sufficient weight to entitle them to be preferred, when they come into conflict with reputable testimony. A man who takes a different view of the Old Testament priesthood would make a correspondingly different construction of what information there is concerning the primitive Semitic ideas of priesthood.

Prof. Smith probably would not claim that his account of the matter can possibly be made to agree with most of the Biblical statements concerning it. Suppose we reconstruct the Hexateuch on the plan proposed by his school, distributing its contents over several centuries, and then reconstruct the history of Israel to make it fit the reconstructed Hexateuch, even then the Biblical statements concerning the priests cannot be interpreted so as to agree with his views; the only course open to an advocate of those views is to accept such items of the evidence as agree with his conclusions, and reject the rest. The Biblical account of the priests of Israel is entirely different from his account, and is in every way credible. It has supernatural elements, which are to be dealt with precisely as we deal with supernatural factors anywhere; but, considered as a historical account, it is contradicted by nothing in philology, or in authentic tradition, or in what we know by experience as to the laws of religious phenomena among men.

The Hexateuchal records inform us that Israel had priests before the giving of the law at Sinai, and the setting apart of Aaron and the Levites for sacred

ministry (Ex. xix. 22, 24). They also mention Egyptian, Palestinian, and Midianite priests, with whom Israel came into contact in the pre-Sinaitic times (Gen. xli. 45, 50; xlv. 20; xlvii. 22, 26; xiv. 18; Ex. ii. 16; iii. 1; xviii. 1). It is well known that the Egyptian priests were not mere keepers of shrines, but mediators by sacrifices between men and the gods. Among the few items mentioned concerning Jethro the priest is his taking "a burnt offering," in addition to the sacrificial feast he made for Moses and the elders of Israel (Ex. xviii. 12). Israel at that time had a national burnt offering, and a ritual of the sprinkling of blood (Ex. x. 25; xxiv. 5, 6, 8; cf. Heb. ix. 19). Israel was then familiar with the idea of a priesthood, as that of men set apart, having peculiar relations respectively with God, and with other men (Ex. xix. 5, 6). From these facts, from the elaborate account in Num. iii. : viii. 5-22, of the taking of the Levites instead of the first-born, and from the pains taken in the popular legislation in Deuteronomy to define the priests there mentioned as "the Levite priests" (just as if, otherwise, some one might understand that non-Levite priests were meant), it is a highly probable inference (not, perhaps, a necessary inference) that these writers meant to be understood that the priests of Israel, when they came out of Egypt, were "the first-born," and that the Sinaitic legislation superseded this priesthood by that of the tribe of Levi. But whether this view or some other be taken, in any case the early Israelite priests are not mere shrine-keepers, but have a genuine mediatorial priesthood.

In the so-called priest-code legislation, "the priests, the sons of Aaron," are sharply distinguished from the Levites; but in most of the passages where this distinction is defined, "the sons of Aaron" are simply his four sons, whose names are mentioned. That is to say, after the death of Nadab and Abihu, the priests, according to the prevailing, perhaps the exclusive usage of the priest-code, are Aaron, Eleazar, Ithamar, and, in the last year of the wandering, Phinehas, and no others, save that the term "priest" is also applied to future descendants of Aaron, as well as to those then living (Ex. xxviii. 1, 3, 4, 41; xxx. 30; xxix. 29, 30; Lev. vi. 15 [22]; Num. xviii. 1-7; xxvi. 1, 2; xxvii. 2, 19, and scores of other places). Occasionally in these writings the terms "the great priest," or the "anointed priest" are used to distinguish the person who, later, was known as the high-priest (Lev. xxi. 10; Num. xxxv. 25, 28; Lev. iv. 3, 5, 16; vi. 15 [22]), but ordinarily the simple term "priest" is used instead. The especial functions of the priesthood are those of mediation and atonement, in connection with the sacrifices and the holy of holies. In distinction from this the Levites had ministrations, external and internal, in the care of the sanctuary, and were the assistants of the priests.

Doubtless the laws of the priest-code assign to the priests of the times of Moses a vastly greater number of duties than it was possible for three men personally to perform. It matters not how we suppose that the writer of these laws intended us to understand this, whether that Aaron had other sons and grandsons besides Eleazar and Ithamar, acting as priests, or whether a body of Levites performed priestly functions under the name "sons of Aaron," though not lineally descended from him, or whether it was understood that he and his two sons were to do their work largely by deputy, or whether we adopt some other understanding of the matter; in any case the term priest, in the priest-code, is ordinarily used either to describe the person who, later, was known as high-priest, or to describe him and a very limited number of sacerdotal chiefs, associated with him.

From this point of view the alleged contradiction of usage between the priest-code and Deuteronomy vanishes. Deuteronomy and Joshua use the term "the priest" precisely as it is often used in the priest-code, to denote the high-priest of the time, Deut. x. 6;

xvii. 12; xxvi. 3, 4; Josh. xiv. 1; xvii. 4; xix. 51; xxi. 1, 4, 13; xxii. 13, 30, 31, 32 (once "the great priest," Josh. xx. 6, from Num. xxxv.). Apparently, however (the point is disputed), these books also call all Levites priests, insisting mainly on the distinction between a Levite priesthood, and a non-Levite, Deut. xvii. 9, 18; xviii. 1-3; xxi. 5; xxiv. 8; xxvii. 9; xxxi. 9; Josh. iii. 3, 6, 8, etc. The Levite priests principally mentioned in these books are those who have charge of the ark, and the other furniture of the sanctuary, and of its internal services; these functions the priest-code assigns to the Kohathite family of Levites, the family to which Aaron belonged. Naturally, the books of Deuteronomy and Joshua never use the term "sons of Aaron" to denote Eleazar and Ithamar; indeed, they use this term only in one passage (Josh. xxi. 4, 10, 13, 19). Here the sons of Aaron are also called priests, and comprise so large a section of the Kohathite Levitical family that they receive 13 cities, while the remaining Kohathites receive only 10, the other two great Levitical families receiving respectively 13 and 12. Whether we suppose that the lineal descendants of Aaron had now become as numerous as these proportions would indicate, or suppose that these "sons of Aaron" were so called from their habitual functions rather than from their parentage, in any case, the representations of these books are capable of being understood in such a sense that they perfectly agree with the priest-code laws.

Thus understood, the state of the Israelitish priesthood, at the beginning of the period of the judges, was about as follows: There was the high-priest Phinehas, resident in Shiloh, the ordinary seat of the tabernacle and the ark; with him were as many Aaronite priests and other Levites as were needed for service; the corps of service was changing, however, some Levites constantly coming in from their homes, and others returning to their homes; the great body of the Aaronite priests, the Kohathites, the other Levites, and the Gibeonite sanctuary servants dwelt in their respective cities in the various parts of the country, or sojourned where they saw fit.

Are these representations contradicted by the other accounts of the times of the Judges and of David? The statement that "the priest," in the narrative of Eli's time, "is always in the singular" is incorrect (1 Sam. ii. 13, the Hebrew, and i. 3). The statement that "Hophni and Phinehas are not called priests" is also incorrect (i. 3). The statement that they "bore the ark" has no ground in anything said in 1 Sam. The fact is that the term "priest" is here used just as in the priest-code and Deuteronomy and Joshua, sometimes to denote the chief priest, and sometimes to denote subordinate priests. The assertion that "the priest of Shiloh . . . sits enthroned by the doorway, preserving decorum among the worshippers," instead of ministering at the altar, is an instance of purely imaginary exegesis. The statement, "Wherever there was a temple there was an oracle, a kind of sacred lot, . . . which could be drawn only where there was an 'ephod,' and a priest" includes particulars not found in 1 Sam. xiv. 18, 41, Sept.; xxiii. 6 *seq.*, the passages on which it is based. The statement from Ex. xxxiii. 7 *seq.*, that "Moses was the priest and Joshua the ædituus" of a tent-temple in the wilderness, has no foundation either in that passage or elsewhere. To infer that the priest "is not the minister of an altar" from such instances as 1 Sam. xiv. 34, 2 Sam. xxiii. 16, 17—instances that have nothing to do with either priest or altar—is inconsequent reasoning. When one says "It is not clear from 1 Sam. ii. 15 whether even at Shiloh the priests had anything to do with sacrifice," he ignores the apparently clear fact that in that passage the worshippers complain of the priests for violating the precept, Lev. vii. 28-34, that the priests' portion was due *after* the burning of the fat. Moreover, in 1 Sam. ii. 28, and elsewhere in the writings connected

with this period, the relations of the priests to the altar are distinctly affirmed.

Further, the assertion that "priesthood was not yet tied to one family," but that there were then in Israel many different priesthoods of different families, ministering at various sanctuaries, and all counted as equally the legitimate priests of Jehovah, is in contradiction with 1 Sam. ii. 27, and with all the account that is given of the priests mentioned in the Books of Samuel, as being the descendants of either Eleazar or Ithamar, the sons of Aaron. The Hebrew text says, not that "The temple at Shiloh . . . was the lineal descendant of the Mosaic sanctuary, . . . and its priests claimed kin with Moses himself," but that the Mosaic sanctuary either was itself the temple at Shiloh, or was there at the temple, 1 Sam. ii. 22; that its priests claimed kin with Moses appears in no other way than by their claiming descent from Aaron. The assertion that "this sanctuary was hardly visited from beyond Mount Ephraim" does not agree with the statements in the narrative, 1 Sam. ii. 14, 22, 24, 28, iii. 20, etc., to the effect that "all Israel" came up thither.

Evidently, the priesthood of Micah's son, Jud. xvii., is not recognized by the writer of Judges as legal. No more is the priesthood of Jonathan, Jud. xviii., although the facts in the case show that the priestly character of the tribe of Levi was then recognized. We have no information as to the descent of Eleazar, 1 Sam. vii. 1, and no intimation that his consecration to be keeper of the ark was regarded as giving him the character of a priest. The priesthood of David's sons, 2 Sam. viii. 18, is best understood as an irregularity of the same nature with the contemporary attempt to carry the ark on a cart, instead of on the shoulders of men. (See paragraph on "David's Period of Rest" in article ISRAEL.)

If it is fair to infer from Deut. xxxiii. 8-10 that "the ritual functions of the priesthood still appear as secondary to that of declaring the sentence of God," it is equally fair to draw the same inference from the yet more decided passage in Malachi ii. 5-8. That is, this double function of the priests belongs equally to the latest times of the Old Testament, and to the times when Deut. xxxiii. was written. The fact is that the Old Testament attributes it to the priests of Israel of every date. And at all dates the function of the priests in regard to the law differs from that of the prophets; the priest administered and interpreted the law that the prophet brought from Jehovah.

In fine, the Old Testament account of the priesthood of Aaron and Levi is that it was organized in the time of Moses; that from the death of Joshua to the later years of David it maintained its succession, though in those troubled times it was largely shorn of its dignity, and often compelled to share the field with illegitimate rival priesthoods; that it suddenly rose to magnificence with the quick blossoming out of Israelite greatness that marked the times following David's conquests; that from the death of Solomon to the Babylonish exile it was maintained in Judah, but with times of decline and times of revival, according to the characters and circumstances of the various kings; that it was preserved through the exile, and restored in the times of the second temple; that it underwent reorganizations, with changes more or less marked, in the times of David, and again after the exile. The view of the matter that represents the priesthood as a gradual growth in the times later than the judges, through the consolidating of the shrine-keepers of the various high places, attaining its distinctive character only in the post-exilic times, is a view that makes more difficulties than it solves, besides being contradictory to the only sources of information we have on the subject. (W. J. B.)

PRIME, SAMUEL IRENÆUS (1812-1885), Presbyterian editor and author, was born at Ballston, N. Y., Nov. 4, 1812. His grandfather, Benjamin Young Prime (1733-1791), was a learned physician of New

York city, who wrote several Revolutionary songs. His father, Rev. Nathaniel Scudder Prime (1785-1856), was an able preacher and teacher. Irenæus graduated at Williams College in 1829, studied theology at Princeton, and entered the Presbyterian ministry in 1833. He had pastoral charges at Ballston Spa and Mattawan, but in 1840 was compelled by ill health to relinquish preaching. He then became editor of the *New York Observer*, which by his able management was rendered one of the most successful religious newspapers. Dr. Prime's visits to Europe and the East in 1853, 1866, and 1876 were narrated in his paper, and these letters afterwards published in volumes. His personal connection with the religious movements of his time gave variety and freshness to his writings. He took a prominent part in the organization and various meetings of the Evangelical Alliance. About fifty volumes are attributed to his pen. Among these, besides his books of travel, the three series of *Irenæus Letters* are the most attractive. The third series, published posthumously, is chiefly autobiographic. He had also prepared biographies of Rev. Nicholas Murray, known as Kirwan (1862), and of Samuel F. B. Morse (1875). His most widely circulated volume was *The Power of Prayer* (1859), which gave the history of the Fulton street Prayer Meeting in New York. He published three later books on the same subject, the last being *Prayer and its Answer* (1882). He died on July 18, 1885, at Manchester, Vt., whither he had gone on a vacation journey.

His brother, WILLIAM COWPER PRIME, was born at Cambridge, N. Y., Oct. 31, 1825. He graduated at Princeton College in 1843 and became a lawyer in New York city. He was a frequent contributor to the newspapers and was editor of the *New York Journal of Commerce* for many years. Much of his leisure was devoted to numismatics and ceramics. He has published *The Old House by the River* (1853); *Boat-Life in Egypt and Nubia* (1857); *Tent-Life in the Holy Land* (1857); *Coins, Medals and Seals* (1860); *I go-a-fishing* (1873); and a handsomely illustrated work on *Pottery and Porcelain*. He has also published monographs on the hymn *O Mother dear, Jerusalem* (1865) and on the *Holy Cross* (1877). His valuable ceramic collection has been presented to Princeton College.

Another brother, EDWARD DORR GRIFFIN PRIME, was born at Cambridge, N. Y., Nov. 2, 1814. He graduated at Union College in 1832 and at Princeton Theological Seminary in 1838. He was pastor of a Presbyterian church at Scotchtown, N. Y., 1839-51. He had charge of the American chapel at Rome in 1854-55, and then returned to New York to assist in editing the *New York Observer*. In 1865 he became also one of its proprietors. He has published *Around the World* (1871) and *Forty Years in the Turkish Empire* (1875), the last being a biography of Rev. William Goodell.

PRIMROSE (Lat. *prima rosa*, the first rose), a handsome flowering shrub, genus *Primula*, largely European in habitat, 5 species growing wild in Great Britain. Different species are known by the common names of Primrose, Cowslip, and Oxlip, the European *P. grandiflora* being the typical primrose. The Eastern United States have but two species of the genus. One of these, *P. farinosa*, the bird's-eye primrose, is also a native of England and other parts of Europe. It is distinguished by a white meanness on the underside of the leaves, the flower stems, and the calyx, the flowers being of a pale lilac color with yellow centre. It is a rare plant, found on the northern borders of the States. Another rare species, *P. mistassinica*, occurs from Maine to Wisconsin along the lake shores. It is a pretty little species bearing from 1 to 8 fresh-colored flowers on a stem 2 to 6 inches high. Several other species occur in the far West, the most important being *P. Parryi*, found originally on Pike's Peak, and since then on several other Rocky Mountain peaks. It is the most beautiful member of the genus, its flowers

being very large and of the richest purple hue. Unfortunately its native habitat, on the banks of streams fed with ice-cold waters from melting snows, unfits it for warmer situations, and it does not yield kindly to cultivation. The American Cowslip, *Dodecatheon Meadia*, one of our most beautiful wild flowers, belongs to another genus of the same family. It is found in woods from Pennsylvania to Wisconsin and southwardly, and bears a gracefully drooping cluster of pale purple flowers. The beautiful garden flowers called *Polyanthus* and *Auricula* are results of cultivation of species of the primrose genus. (C. M.)

PRINCETON COLLEGE. See NEW JERSEY, COLLEGE OF, and THEOLOGICAL SEMINARIES.

PRINCIPAL AND AGENT. Agency is founded upon a contract, either express or implied, by which one of the parties confides to the other the management of some business to be transacted in his name or on his account, and by which the other assumes to do the business, and to render an account of it. The authority may be by deed or writing, or verbal merely. The agency may be inferred from the relation of the parties and the nature of the employment, without proof of any express appointment. If the agent is to convey or complete the conveyance of land or interests therein, however, the appointment must be in writing. The agency must be previously given or subsequently adopted. Acquiescence in the assumed authority of another when his acts are known to the principal is equivalent to an express authority. Thus it has been held that if a confidential clerk has been accustomed to draw checks for his principal, and has occasionally been permitted to endorse for him, the jury would be warranted to infer a general authority to endorse.

An agent intrusted with general powers must exercise a sound discretion, and he has all the implied powers which are within the scope of the employment. If his powers are limited, he must strictly follow them: he cannot have an adverse interest or employment, as to represent both buyer and seller. If an agent exceeds his powers, his principal is not liable on the contract except so far as the agent was authorized to go. If the agent executes his commission in part only, the principal is liable in some cases, as if the agent was empowered to buy a farm of fifty acres and he bought one of forty acres, corresponding to the directions as nearly as possible. The acts of a general agent, with power to transact all the principal's business of a particular kind, or at a particular place, will bind the principal so long as the agent keeps within the general scope of his authority, though he may act contrary to private instructions. But an agent appointed for a particular purpose, with limited power, cannot bind his principal if he exceeds that power. Any one dealing with such an agent does so at his peril, when the agent passes the precise limits of his power; as where C, a holder of a bill of exchange, desired A to get it discounted, but refused to endorse it, and A procured B's endorsement to it, it was held that C was not bound, A being a special agent with limited authority, not to endorse the bill. The presumption of an authority to sell is inferred in some cases from the nature of the business of the agent, as if a broker be intrusted by a merchant with goods, the principal would be bound by a sale of them. A factor, who buys or sells on commission, may sell on credit if the usage of the trade is such, provided he be not restrained by his instructions, does not give an unreasonably extended credit, and uses due diligence to ascertain the solvency of the purchaser. He cannot sell on credit, however, where such is not the usage, as in a sale of stock. A note taken in this way by a factor belongs to the principal, even if the factor has sold without disclosing his principal. Should the factor fail, the note would not pass to his assignees upon the doctrine that the principal may follow his goods or the proceeds into the hands of the agent or of his legal representatives or assignees.

The sale by an agent on what is known as a *Del Credere* commission, i. e., on credit at his own risk, for an additional premium, has generally been held to substitute the agent's liability to the principal for that of the purchaser.

A factor cannot pledge the goods of his principal for his own debt. In such case the principal may look to the pledgee for the goods: there is an exception to this rule, however, in the case of negotiable paper, unless notice of the fraud or want of title can be brought home to the endorsee.

Where an agent is duly constituted, and names his principal, and contracts in his name, without exceeding his authority, the principal becomes responsible: the agent is personally liable only when the principal is not known, or where there is no responsible principal, or where the agent undertakes in his own name, or exceeds his power. If the agent buys in his own name, but for the benefit of the principal, without disclosing his name, both are bound, provided the goods reach the principal, or the agent acted in the business intrusted to him and within his power. If the authority of the agent be coupled with an interest in the property, he may sell in his own name and be personally liable, e. g., the case of a master of a ship, or a mortgagee. It has been generally held that an agent cannot be sued on a written contract binding the principal only, made by the agent without authority. Where goods have been sold by a factor, the owner may call upon the purchaser for the price before payment to the factor, and a payment to the factor after notice from the owner not to pay would not prejudice the rights of the owner. Where a party dealing with an agent, knowing him to be such, elects to make the agent his debtor, he releases the principal. It has been generally held that an agent, making a contract on behalf of a government, is not responsible himself, though by the terms of the contract he might be if it were private: the presumption in such case is that the party who deals with a public agent relies on the good faith and standing of the government.

The general principle is that an agent is liable to third persons for acts of misfeasance and positive wrong; but for mere non-feasance and negligence in the course of his employment, he is answerable only to his principal, and the principal is answerable to the third party.

Since agency is generally a personal trust, the principal employing the agent from the opinion which he has of his personal skill and integrity, the latter cannot as a general thing delegate the confidence reposed in him to another. In some cases, however, a usage of trade has been held to authorize an agent to employ a broker.

A factor has a lien on the goods of his principal in his possession, or on the proceeds if he has sold the goods, for his charges and commissions. In like manner attorneys, bankers, etc., have a lien on the papers of their clients for the amount of their charges.

The authority of the agent may terminate (1) *by his death*; this results from the personal nature of the trust; (2) *by the principal's revocation*, in which case the agent must immediately be notified: all acts of the agent under the agency previous to notification are binding on the principal: so also if the agent had concealed the fact of notification, and the public had no means of knowing of it; (3) *by a change in the state or condition of the principal*, as by his bankruptcy, or lunacy, or the marriage of a *feme sole* principal; (4) *by the death of the principal*: under the civil law the acts of an agent, done *bona fide*, after the death of the principal, but before notice of it, bind his representatives. In England and America, however, it has generally been held that the death of the principal is an instantaneous and absolute revocation of the agent's authority, unless the agent's power be coupled with an interest. (T. B.)

PRINTING. See TYPOGRAPHY.

PRISON DISCIPLINE. Prisons are as old as history. Eighteen centuries before the Christian era

Joseph, in Egypt, was in prison, and Egyptian monuments testify clearly that prisons were common on the Nile many centuries before. In Chinese annals prisons are mentioned a thousand years before the time of Joseph, and doubtless they have been a necessity wherever an organized government has been maintained.

Prior to the present century, however, prison management with rare exceptions seems to have been little else than organized cruelty. The founder of Christianity had taught that mercy to prisoners was a sign of his coming, and had inculcated the remembrance of prisoners as brethren in bonds, but yet in the practical administration of prisons the hearts of rulers seem to have been hardened, and darkness reigned supreme. It is true the church did something, and under Constantine and succeeding Christian emperors the bishops were authorized to visit prisons with a view to their amelioration, and under Theodosius II. and Justinian, criminal codes were somewhat improved, but the results were not large, and prison reform as a continuous entity had no abiding-place upon the earth until the beginning of the present century.

When we remember that through the Christian centuries the typical prisons were the Mamertine at Rome, the Tower in London, the Bastille in France, the Spielberg in Austria, the Plombs of Venice, and the dungeons of the Inquisition, we may rest assured that the horrors of prisons, in all ages, cannot well be exaggerated. The dark ages of prisons were very dark, and their annals are an interesting and instructive study, but the purview of this article is modern and local rather than ancient or general, and will be confined almost entirely to the United States of America. The history and management of prisons in Europe and other countries of the Eastern Hemisphere have been fully and clearly presented in the *ENCYCLOPÆDIA BRITANNICA*, which should be consulted by those who desire additional information upon this topic.

Penology as a practical science, and a positive force in the world, in the main, had its origin with John Howard. As Paul was the apostle of Christianity to the Gentiles, so Howard was the apostle of prison reform to modern nations. As Paul was converted by special revelation on his way to Damascus, so Howard was converted by the revelations of Bedford gaol. Both served the same master, and both died as martyrs. Paul in the Mamertine prison at Rome, and Howard in a lazaretto at Kherson, near the Black Sea.

The investigations and revelations of Howard attracted attention in all civilized countries, but curiously the fruition of his work, to any large extent, began in America. Howard began his work in 1773, and his first report was made in 1774. On Feb. 2, 1776, the first Prison Reform Association in the world was organized in Philadelphia. It was called "The Philadelphia Society for Assisting Distressed Prisoners;" but in September of the following year the British army entered this city, and the society was dissolved.

Ten years later, May 8, 1787, peace being restored, the society was reorganized, and has continued its beneficent work until the present.

The fact that over one hundred prominent men of Philadelphia (among whom were Benjamin Rush and Benjamin Franklin) signed the original constitution of the society on the day of its adoption indicates the aroused condition of public sentiment at the time, and enables us to understand the reasons for the rapid progress made in the amelioration of the criminal laws of Pennsylvania, and in the improvement of prisons. The impelling motive of the society is indicated in the closing paragraph of its first appeal to the community for funds to carry on its work: "To a people professing Christianity it will be sufficient only to mention that acts of charity to the miserable tenants of prisons are upon record amongst the first Christian duties.

From ladies therefore whom Heaven has blessed with affluence and the greater gift of sympathy—from gentlemen who acknowledge the obligations of humanity—and from the followers of the compassionate Saviour of mankind, of every rank and description, the society thus humbly solicits an addition to its funds."

Perhaps a more thorough transformation in the character of a penal code, by peaceful legislation, is not recorded in the world's history than that which took place in the penal code of Pennsylvania during the eighteen years immediately succeeding the Declaration of Independence. When the Revolution commenced, nearly a score of crimes were capital. High treason, petit treason, murder, robbery, burglary, rape, sodomy, malicious maiming, manslaughter by stabbing, witchcraft, arson, and a second conviction of any crime except larceny, counterfeiting, or passing counterfeit money or bills of credit, counterfeit gold or silver coin, were all punishable with death; but by 1794 such progress had been made that it was ordained that no crime should be punished with death except murder in the first degree.

The Pennsylvania society began its work on the very day of its organization by securing the release of a prisoner held in violation of law and followed it up by persistent and continuous efforts for a more humane administration of prisons. The city prison of Philadelphia secured special attention, and the society protested against its abuses in vigorous language: (1) that the clothing of the prisoners was insufficient; (2) that the daily allowance to prisoners committed for trial was only half of a four-penny loaf, while those detained as witnesses had no allowance at all; (3) no provision was made for decent lodging, the inmates of the gaol lying indiscriminately upon the floor, unless supplied with something better by their friends; (4) the indiscriminate intermingling of criminals, untried prisoners, and debtors was another monstrous abuse, and led in many instances to the conversion of debtors and innocent parties into criminals; (5) that parents were allowed to have their children with them in gaol, and young offenders were exposed to the corrupting influences of association with confirmed and reckless villains; (6) it was presented as a radical evil that a large proportion of prisoners were unemployed; and further it was maintained that labor, even in the public streets, was preferable to sheer idleness within the walls.

In view of these considerations the society recommended "The classification of prisoners, and as far as possible individual reformation with labor in seclusion, and the interdiction of all intoxicating drinks." And so energetically were these points pressed upon the Legislature that on April 5, 1790, an act was passed to reform the penal code of the State. By this act the principle of separation was recognized so far as "hardened and atrocious" offenders were concerned, and intoxicating drinks were entirely prohibited. In 1794 this act was amended so as to require the separation and seclusion of *all* convicts, and, as has already been stated, the death penalty was abolished in all cases except for murder.

The society did not stop here, for we find them in 1796 pressing upon the Legislature the abolition of exacting fees as a condition of liberation from imprisonment. Also the subjection of prisoners to the pillory, the whipping-post, the branding-iron, and cropping, together with exposure to the gaze and taunts of the rabble with external marks of degradation such as the clog and chain upon the neck or leg. When we remember that all these occurred twenty years before Elizabeth Fry exposed the horrors of Newgate in London, and nearly thirty years before remedial legislation was obtained from the British Parliament, it is apparent that the State of Pennsylvania was in advance of all other civilized countries in the matter of prison reform.

As the years went on additional improvements were secured in the criminal laws of Pennsylvania, until at

last the greatest advance in prison reform, which had yet been made in the world was obtained by the creation and completion of the Eastern Penitentiary at Philadelphia, which was opened on Oct. 25, 1829. This prison soon became famous, and attracted attention in all civilized countries, and imitation in many; and even now, after a lapse of sixty years, it ranks as one of the best managed prisons in the world.

The system of cellular separation, or, as it is more generally called, solitary confinement of prisoners, was here for the first time put into operation as an entirety, and has since been known in penological science as the "Pennsylvania System." The entire and permanent separation of prisoners under sentence, as required by the Pennsylvania system, is not now generally approved by penologists, and has been abandoned in all other convict-prisons in the United States, and largely in other countries, but for prisoners awaiting trial, and for brief periods after sentence as an initiatory stage of prison discipline, it is almost universally considered desirable by penologists.

At Philadelphia the system is no longer enforced in its original strictness, and prisoners are brought into such frequent contact with prison officials, and with individual prisoners, as to obviate largely the evils of entire isolation. In Belgium, also, where the system was adopted in all convict-prisons, the severity of continued separation has been largely relaxed, and such improvements have been introduced as to recall the favorable attention of penologists, and to a certain extent to cause a reaction of opinion in its favor, at least in a modified form.

The first prison in America to follow the example of Philadelphia was that at Auburn, N. Y., which adopted the Pennsylvania system in 1830, but, unlike the prison at Philadelphia, no employment was provided and in fact the cells were not of a size to permit such employment, and the result was the early abandonment of the system. In its place labor in association, by day, was provided for the prisoners, and solitary cellular confinement at night. This soon became known as the Auburn or congregate system, and is still so recognized.

The Pennsylvania system was also adopted at Sing Sing, N. Y.; at Thomaston, Me.; at Providence, R. I.; at Trenton, N. J., and the Western Penitentiary of Pennsylvania at Allegheny, but it was soon abandoned for the Auburn system in all of them, and since then the Auburn system, with various modifications, has prevailed, almost universally, in American penitentiaries.

Aside from these two systems only one other has been operated to any large extent in the United States, and that is known as the lease system, which was adopted from necessity rather than choice in nearly all of the Southern States, immediately after the war of the rebellion, but which does not exist in any Northern State except Nebraska. Upon the liberation of 4,000,000 slaves there came such a sudden and large increase of prisoners, convicted of felonies, that sufficient room for their confinement could not be found in existing prisons, and therefore, as an available and economical expedient for getting rid of them, they were leased out to the highest bidders for the term of their sentences. The lessees were to have the entire control of the prisoners under certain restrictions as to care and management, and for the privileges thus secured they were to maintain the prisoners, and pay the State a stipulated price per capita.

This system, in reality, is a modified form of slavery, but of necessity is far more dangerous and cruel than unlimited slavery, with that personal ownership in the master which makes him interested in the preservation of his property. In the nature of things it cannot last long in any civilized country, and is now rapidly passing away. In fact, the only Southern States in which no legislative action has yet been taken for the extinction of the lease system are Georgia, Florida,

Tennessee, Mississippi, Arkansas, and Louisiana, but in these there is a powerful and growing public sentiment which promises its entire and speedy termination.

Next to Pennsylvania, in point of time, the State of Massachusetts became actively interested in the reform of prisons through the organization of "The Society for the Improvement of Prison Discipline, and for the Reformation of Juvenile Offenders," at Boston, in 1815. This was the second great prison society of the world. The third was "The Royal Prison Society of France," organized in 1819; and the fourth, "The Boston Prison Discipline Society," established in 1824.

These two Massachusetts societies did an active work for many years in the education of public sentiment, and, through their influence largely, the State has kept abreast of the best experiences of the world in its methods of dealing with the criminal classes, and taken as a whole its prison and reformatory methods are not surpassed by any State in the Union, and in some respects they are in advance of all others. The prison for women at Sherborn, and the reformatory for men at Concord, are especially noteworthy, and the Suffolk county jail in Boston for many years has been a model for the nation in its enforcement of the absolute separation of all prisoners awaiting trial. The probation system for misdemeanants in force in the city of Boston has also attracted large attention among penologists, and its centralized control of prisons is worthy of imitation everywhere.

The State of New York, in its efforts for better methods of prison management, followed Pennsylvania and Massachusetts very closely, and in one respect was in advance of both of them. "The House of Refuge," opened in 1825, and still in operation at Blackwell's Island, was the first institution for juvenile delinquents in the United States, and was the outgrowth of the work of "The Society for the Prevention of Pauperism," established in 1818, and reorganized in 1823 as "The Society for the Reformation of Juvenile Delinquents." Since then New York has always maintained an advanced position in all matters pertaining to prisons and prison management.

The prison at Auburn, established in 1816, as we have already seen, created and gave its name to the congregate system, now almost universally adopted in the United States, and the reformatory prison at Elmira, established in 1877, marks a new era in prison management, and is now the model prison of the world in its methods of dealing with felons under 30 years of age convicted of their first offence. The indeterminate sentences in force at Elmira are no longer experimental, and for this class of criminals are now almost universally approved by penologists. So, also, the Elmira plan of segregating the prisoners into three classes under the mark system, together with industrial training and conditional discharges, are features of the highest value, which are being rapidly adopted elsewhere. New York was also the first State in the Union to establish a hospital, separate from its prisons, for the custody of insane criminals, which has been in operation at Auburn since 1858.

The organization of the New York Prison Association in 1844, and its continued activity since, has also exerted a wide influence in all matters pertaining to prisons, not only in the United States but in foreign countries. By the efforts of this association and its accomplished secretary, Rev. E. C. Wines, the organization of the National Prison Association was effected in 1870, and of the International Prison Congress in 1872, both of which have contributed very largely to the advancement of prison reforms, and still remain in active operation.

The State of Ohio also has taken an advanced position in prison improvements, and has in process of completion a general system of prisons upon a comprehensive plan of progressive classification, which pro-

vides jails so constructed as to secure the absolute separation of all prisoners awaiting trial (of which a score or more have already been completed), district workhouses for misdemeanants, an intermediate penitentiary for young men under thirty years of age convicted of felony for the first time (now being erected at Mansfield), and retains the old penitentiary at Columbus for life-prisoners and incorrigibles.

For delinquent children Ohio was the first State in the Union to establish reformatories upon the family or cottage system. The first was for boys, at Lancaster, in 1858, and the second, for girls, at Delaware, in 1878. Ohio has also taken the lead in establishing a system of paroles for penitentiary prisoners, and in making a third conviction for felony conclusive evidence of incorrigibility, and subjecting the offender to imprisonment for life.

During the first half of the present century the United States were clearly in advance of all other nations in prison management, but since then we have fallen behind, and other nations, having adopted all that was best in our American systems, have added large improvements of their own.

In recent years, however, through the influence largely of State boards of charities and correction, and the conferences and publications of the national and local prison associations, there has been a revival of public interest in America upon prison subjects, and annual improvements are indicated by the action of Legislatures in almost every State.

The fact that in the United States, for many years past, there has been a steady increase of crime in a ratio largely in advance of the increase of population, has also emphasized the necessity of better methods in dealing with the criminal classes, and has aroused public attention. This increase, as indicated by the U. S. census reports, is as follows:

Year.	Prisoners.	Ratio to population.
1850.....	6,737	1 out of 3,442
1860.....	19,086	1 " " 1,647
1870.....	32,901	1 " " 1,171
1880.....	58,609	1 " " 855

That this rate of increase has been checked somewhat now seems assured by reports of investigations in several States, and it is probable that the national census of 1890 will show a perceptible and possibly a large decrease in the country as a whole.

The science of penology is no longer in a chaotic condition, for its fundamental principles are as well established as those of any other science relating to social development, and their application in other countries, and notably in England, has shown that crime can be so dealt with that, instead of increasing, it can be steadily diminished. In the nature of things, preventive measures will always be more potent for good than any others, but still the necessity will always remain for intelligent treatment of those actually convicted of crime and sentenced to prison confinement. At the bottom of all effective prison management, and without which no large results in the reformation of criminals can be obtained, is such classification as will cut off, or at least minimize, the contaminating influences of evil associations.

According to the census, the number of prisoners in the United States, June 1, 1880, not including the inmates of reformatory institutions for juvenile delinquents, was 58,609. The number of juvenile delinquents reported was 11,468. The total number, therefore, of criminals and quasi-criminals, taken together, was 70,077. Of the 58,609 prisoners, properly so called, 30,659 were found in penitentiaries, 7865 in workhouses and houses of correction, 12,691 in county jails, 1166 in city prisons, 499 in military prisons, 350 in hospitals for the insane, and 4879 were leased out to private parties.

It will be noticed that of these prisoners 14,359, or

nearly one-fourth of the entire number, were in county jails and city prisons. This, however, only represents the number actually in confinement on the day of enumeration. Taking the whole year through, the number of separate prisoners actually confined in jails and city prisons would be increased at least tenfold, and possibly twentyfold; and if we include village lock-ups and city station-houses, the number would again be increased many times. It is very evident, therefore, that in the classification of prisoners, with a view to prevent the contaminating influences of association, the largest attention by far should be given to county jails and city prisons, and it is here our American prisons are most deficient. In fact, at this one vital point of unrestricted association among prisoners, our American jails are substantially the same as the jails of England were found by John Howard a century ago.

In England at the present time jails, by act of Parliament, are simply places of detention for prisoners awaiting trial, and each prisoner is kept entirely separate from every other prisoner; but in America, with very rare exceptions, prisoners in jail are herded together in a common hall, and all the evils of association are not only permitted, but enforced, so that the jail becomes a school of crime and a moral pest-house. So long as this continues all penologists are agreed that no large advance in the suppression of crime can be expected, and they are also agreed that cellular separation is the only effective remedy.

Several States are making progress in this direction, notably Massachusetts and Ohio. The Suffolk county jail, in Boston, has already been referred to as the pioneer in cellular separation, and in Ohio nearly all new jails, for several years past, have been constructed upon what is known as the central corridor or Ohio plan, which provides for the entire separation of prisoners, and in several such separation is now enforced; and a law is now under consideration by the Legislature to make it compulsory in all.

In England, by act of 1877, the control of jails was vested in a body of prison commissioners, appointed by and responsible to the Home Secretary, which secured uniformity of action throughout the kingdom, and contributed largely to the present pre-eminence of English prisons; but in the United States the control and maintenance of jails, except in Massachusetts, is entirely with county authorities, and so long as this continues progress will necessarily be slow. It is so clearly evident that jails, together with all other prisons, should be wholly under control of the State authorities, that it would only seem necessary to bring it to the attention of the public, in order to secure its adoption, but thus far local and political interests have been strong enough to prevent affirmative action.

Outside of jails and other places of detention for prisoners awaiting trial, the prisons of the United States, as a whole, are not inferior to those of other countries, either in construction or management, and many of them are keeping fairly abreast of the best experience of the world. In each of the Northern States, and in most of the Southern States, there is at least one penitentiary for prisoners convicted of felonies; and in some of the larger States there are two or three, and all of these, except the Eastern Pennsylvania Penitentiary, at Philadelphia, are conducted upon the congregated or Auburn system of management, which maintains cellular separation at night, and associated labor in silence by day.

The tendency of public sentiment in the United States now seems to favor such classification of penitentiaries as shall provide for the separate confinement of young men under thirty years of age convicted of their first offence. The first prison of this kind was established at Elmira, N. Y., and is known as the Elmira Reformatory. Its success in the reformation of prisoners has been so conspicuous that several other States have adopted the system. The reformatories at Concord, Mass., Huntingdon, Pa.,

and Mansfield, Ohio, are prisons of this kind, and similar prisons are now being constructed in Minnesota and Kansas, and are under legislative consideration in several other Western States.

The distinguishing features of the Elmira system are: (1) The Indeterminate sentence. (2) Classification of prisoners into three grades regulated by a system of merit and demerit marks. (3) Discharge upon probationary parole, under supervision. The Elmira system is distinctly a new departure in prison management, and is receiving large attention, not only in the United States but in other countries, and the general adoption of its leading features now seems probable.

There is also a growing sentiment in favor of separate prisons for women, to be entirely controlled by women. Two such prisons have been in operation for several years, one at Indianapolis, Ind., and one at Sherborn, Mass., and their advantages are so manifest that others are contemplated in several of the larger States.

In the United States there are no prisons owned and controlled by the general government, except a few territorial jails, and the military prison at Fort Leavenworth, Kas. Prisoners convicted of felonies under federal laws are confined in such State penitentiaries as may be designated by the Attorney-General of the United States, under agreements with State authorities. Of this class of prisoners 1228 were reported July 1, 1886, as serving out sentences in 55 separate prisons, in 25 States, 6 Territories, and the District of Columbia. That a great government like ours should convict its citizens of violations of its laws, and then consign them to prisons in which it has no ownership, and to the care of officials over whom it has no control, is not creditable, and attorney-generals for several years past, in their annual reports, have recommended the erection of federal prisons for all prisoners of this kind. Bills for this purpose have been considered by Congress, but no act has been passed.

The attorney-general has also recommended to Congress some action for the better care of federal prisoners awaiting trial, or serving sentences for misdemeanors, of whom there are several thousand, who are at the present time kept in the local jails of the judicial districts where the offences were committed, and are substantially outside of any federal care or supervision.

Misdemeanants.—For misdemeanants, especially, there would seem to be an imperative necessity for workhouse or reformatory care, for association in idleness, as at present, with hardened criminals in county jails, cannot be otherwise than demoralizing. For misdemeanants generally there is now large consideration among penologists on account of the apparent inefficiency of existing methods for their treatment. By the term misdemeanants is meant such persons as are convicted of offences less than felony, and are usually sentenced for short periods to jails or workhouses. As these institutions are wholly under county or city control they seldom receive that intelligent supervision or management which is essential to their highest efficiency. Penologists are substantially unanimous in the opinion that district workhouses exclusively under the control of the State should be provided for this class of prisoners, and that jails should be solely places of detention for prisoners awaiting trial.

In view of the fact that workhouse misdemeanants are largely recidivists for whom short periods of confinement have no terrors, it is also advised that sentences should be cumulative, and after a third or fourth conviction be made indefinite, with a maximum limit of five years.

In the United States, in recent years, an obstructive interference in the management of prisons has arisen from the opposition of outside labor organizations on account of the supposed injurious competition of prison labor with free labor. In a few of the Northern States this influence has been sufficiently powerful to

secure legislation entirely abolishing contract labor in prisons, and in New York by act of July, 1888, not only contract labor but all other forms of labor are practically abolished in the penal institutions of the State. This law entirely prohibits the use of machinery in prisons, and only permits handwork in the manufacture of clothing and other necessary supplies for the public institutions. This, possibly, may give employment to prisoners for a month in the year, but for the remainder of the year there seems no recourse but idleness. In the estimation of all prison experts, not only in this country but throughout the world, there can be nothing more injurious to the discipline of prisons, or to the conditions essential to the reformation of prisoners, than enforced idleness. If this kind of legislation is to prevail, and become permanent, it must follow as the night the day that American prisons will retrograde to the condition of the dark ages, and the progress of the last century will be practically lost.

That there is ground for objection to contract labor most penologists agree, and they greatly prefer some other form of labor, whenever the reformation of prisoners is a leading object, but that productive labor of some kind is an indispensable requisite to the proper conduct of convict prisons of every grade is considered by all students of penology and by all practical prison managers settled beyond all dispute. It is not likely, however, that a people as intelligent as those of New York, or of any other State, will submit for any long period of time to the taxation necessary to maintain in absolute idleness an army of criminals, and especially when they discover, as they will, that no good comes by it either to the laborers outside of the prison walls or to prisoners inside.

The total amount of prison labor in the United States, as compared with the total amount of free labor (as shown by the report of the U. S. Commissioner of Labor, for 1886), is only $\frac{1}{4}$ of 1 per cent., and therefore by the economic law which shows that wages (the price of labor) are not fixed by the number of laborers or the producing power of any single manufacturing industry, but are governed by the total number of laborers and the total production of all the industries of every kind in the country, it is absolutely certain that the abolition or retention of prison labor cannot have any appreciable effect upon the wages of free labor or the price of its products.

The concentration of all prison labor upon a few industries, doubtless, might affect, injuriously, industries of the same kind outside, and might compel their operatives to seek other employments on account of overproduction, as often occurs in other cases, but even then there would be no perceptible influence upon the general average of wages. As a matter of fact such concentration has rarely occurred to an injurious extent, and such cases could easily be corrected by legislation.

The total number of persons employed in prison industries, and the total number of free laborers in the same industries outside, is shown by the following statistics from the census reports of 1880:

Form of industry.	Total No. citizens.	Total No. convicts.	No. of convicts to 100 citizens.
Agricultural implements...	39,580	284	0.7
Bolts and rivets.....	5,064	167	3.3
Boots and shoes.....	134,256	6,358	4.7
Boxes.....	17,400	55	0.3
Brickmaking, quarrying..	66,355	1,016	1.5
Brooms and brushes.....	8,773	1,786	20.3
Buttons.....	5,825	29	0.5
Carpeting.....	21,023	304	1.4
Chairs.....	10,575	3,313	31.3
Cigars and tobacco.....	53,297	659	1.2
Clothing.....	160,813	1,291	0.8
Cooperage.....	25,973	821	3.1
Foundry and machinery...	110,351	157	0.1
Furniture.....	48,729	946	1.9
Hardware.....	17,501	215	1.2
Harness and saddlery.....	21,446	1,014	4.7

Form of industry.	Total No. citizens.	Total No. convicts.	No. of convicts to 100 citizens.
Hats	22,671	326	1.4
Hemp and jute	4,336	392	9.1
Hosiery and knitting	28,885	2,417	8.3
Lime-burning	4,570	218	4.7
Marble work	21,471	320	1.5
Printing	58,478	82	0.1
Railway cars	14,232	180	1.2
Saddlery hardware	2,815	536	19.0
Shirts and collars	25,687	684	2.6
Stoves and hollowware	35,000	1,576	4.5
Tanning	23,812	87	0.4
Tools	13,679	248	1.8
Trunks and valises	4,514	25	8.8
Wagons and carriages	46,704	1,458	3.1
Whips	1,056	130	12.3
Wire-work	4,459	208	4.6
Total	1,059,020	27,302	2.5

It appears, therefore, that only 32 industries, all told, are represented in the prisons of the United States, and that the aggregate of these industries compared with the same industries outside is only 2½ per cent. It should be remembered also that a large proportion of prisoners are employed in the same industries inside that they were previously engaged in outside, and as the product of their labor inside cannot be greater than it was outside the percentage of competition should receive corresponding reduction. The productive power of convict labor is also much less than free labor, so that the 2½ per cent. of apparent competition, small as it is, should be largely reduced. In fact, except for political purposes, it would scarcely be noticed.

As with prison labor, so also with prison administration, political influences of a partisan character have been largely injurious. In fact, to a large extent, prison officers are selected, not because of experience and trained efficiency in prison management, but because of their services in securing votes for the dominant political party, and prisons can be named in which it has been the established custom for many years that whenever a change of politics occurs in the State, all persons within the prison walls, except the prisoners, must go out, and the result is untrained officials, and terms of office so brief, as to forbid the attainment of the experience essential to the highest efficiency in prison management. Until this evil can be corrected American prisons must remain at a disadvantage in comparison with other countries.

In England the entire prison service is organized under the control of the Secretary of State for the Home Department, subject to whose orders each class of prisons is governed by central boards of directors and commissioners, and constantly examined by government inspectors and by local justices. The officers within the prisons are men who devote their lives to the work, and are appointed and promoted, paid or pensioned, solely for fitness, experience, and efficiency in the service. "Politics" are utterly without influence in the matter. Every appointment is made after a rigid examination into qualifications for the special work in hand, and then is probationary only, its continuance depending solely upon proved efficiency. Administrations, parties, and governments may rise or fall, but from the chairman of directors of convict prisons, now the highest authority in the kingdom on the subject of prison discipline, down to the humblest turnkey, every man is secure in his place while he fills it well; not one can be dislodged or fail of his fair promotion except by failure to do his work.

In France, at Metz, in connection with the agricultural penitentiary at that place, for forty years past there has been a training-school for prison officers, and M. De Metz, its veteran superintendent and the highest authority in the world upon this subject, has declared that a good penitentiary establishment is impossible which does not create a nursery of agents from which to recruit its staff. So also in Belgium and other con-

tinental countries where high attainments have been made in prison management, efficiency of administration by trained officials is considered indispensable, and without it no prison, however complete in its construction and equipment, can be a success, either there or here.

In the construction, classification, and management of prisons in the United States a greater advance has been made in the last decade than in the previous quarter of a century. The discussions and interchange of experiences among penologists at national and international conferences have brought about an intelligent consensus of opinion which has had a large influence for good, not only in prison management but also in legislation pertaining to prisons, and there is every reason to hope that in the near future a still larger and more general advance will be made in all our methods of dealing with the criminal classes.

As to the character of these improvements there is now, substantially, no difference of opinion among American penologists, and their leading requirements may be briefly summarized as follows:

1. County jails should be solely places for the detention of prisoners awaiting trial, and in them no prisoner should be permitted to associate with any other prisoner.

2. Prisoners convicted of misdemeanors should be sent to district workhouses and employed at productive labor.

3. Prisoners convicted of felony should be sent to penitentiaries, of which there should be at least two in each State—one a reformatory for young men, and the other for life-prisoners and incorrigibles, and no prison should contain a population exceeding 1000, and a reformatory not more than 600.

4. All sentences, except for life, should be indefinite, subject to parole and police supervision within a minimum and maximum limit.

5. All able-bodied prisoners should be kept at productive labor, but those in reformatories should receive such educational and industrial training as will enable them to earn an honest living after discharge.

6. All prisoners upon discharge should be systematically aided to obtain employment.

7. Prisoners convicted more than twice for felony should be adjudged incorrigible, and sentenced for life, or at least for long periods, with the privilege of parole for good conduct at the maximum limit of a first conviction.

8. Prison officers should be as thoroughly trained for their duties as are army and navy officers, and their tenure of office should be as secure and their compensation as liberal.

9. Prisoners convicted of violations of federal laws should be confined in prisons owned and controlled by the general government.

10. In all prisons moral and religious culture should be the leading reformatory influences, and a prison school, with competent instructors, should be an indispensable requirement. (R. B.)

PRIVATEERING is the practice of sailing armed vessels owned and officered by private persons, but acting under a commission from a state, which authorizes them to cruise against the commerce of an enemy.

See Vol. XIX, p. 764 (p. 784 Am. Rep.). Such commission is usually called a "letter of marque," the term being derived from a procedure upon land, granting license to go across the boundary ("mark") and make reprisals. A privateer corresponds to a troop on land commanded by private parties, but acting under authority of the state, rather than as a guerilla band. A privateer without a license from the state would be liable to the charge of piracy. The use of privateers in Europe dates back to the time when large public navies had not been formed. During the Middle Ages the European states without navies impressed merchant vessels in time of war. Private parties also engaged in warfare upon the high seas in

their own vessels or at the public expense. There were also free plunderers, who hired public vessels and sailed them with crews and outfits of their own, the expedition of the French against the Portuguese at Rio Janeiro, in the reign of Louis XIV., being an example. It was toward the end of the sixteenth century, in the middle of the war in the Netherlands, that letters of marque began to be issued. William of Orange appears to have used this method, and he was met in retaliation by the Spanish government. The French adopted privateering about 1555.

The advantage of privateering on the side of a nation with a small navy, when it is at war with a nation having a large commercial marine, is very evident. The United States had this advantage during the war of the American Revolution, yet Benjamin Franklin, in his correspondence with the British authorities, declared that though the practice of privateering may be incidentally beneficial, yet "it is a remnant of piracy, and is far from being profitable to all engaged in it or to the nation that authorizes it." He claimed that farmers, fishermen, and merchants should not be molested by enemies even in times of war; and his doctrine was incorporated in the treaty of 1785 between the United States and Prussia, which he fashioned. This treaty provided that neither of the contracting parties should issue any commission to any private armed vessels against the other, empowering them to take or destroy its trading vessels, or to interrupt commerce. When this treaty expired, in 1799, this article was not renewed. Had it been renewed, and had Great Britain and the United States agreed to the same, it would have been a fortunate thing for the former power in the war of 1812, and for the latter in the civil war of 1861. Thomas Jefferson is known to have approved of the practice of privateering, and to his influence may be attributed much of the privateering carried on by Americans in the war of 1812. During the war of the Revolution the people of the United States had engaged in the practice in but a small degree, except toward the latter end. New London, Conn., became head-quarters for the privateers, and this fact afforded an excuse to the British for burning it in September, 1781. The Legislative Assembly of France in 1792 proposed that all nations should do without privateering, but not one of them adopted the suggestion.

The war of 1812, the second between Great Britain and the United States, proved the opportunity of the Americans to prey upon British commerce. Congress declared war June 18, 1812, but 75 days before that date there was a list of 18 privateers already fitted out at Baltimore, and by October 15 there were 26 from New York. The first British ship was captured July 1, and by July 14 it is said that there were at least 65 privateers at sea. In November the owners of 24 privateers from New York petitioned Congress to reduce the duties on prizes, and to allow captors to dispose of such prizes. The first privateers of this war carried less than 10 guns, but later from 20 to 30 guns were carried. It is stated that a contract was made in Boston for the building of a privateer in 18 working days. The estimate is that within 2 years more than 800 British vessels were captured. The list of American privateers numbered 250 in all, of which 58 were from Baltimore, 55 from New York, 40 from Salem, Mass., 32 from Boston, and 14 from Philadelphia. At the opening of the war the effective force of the American navy consisted of only 7 frigates, with a total of 278 guns.

In 1818 Congress passed a law forbidding the enlistment, within the United States, of any person on board of any privateer belonging to a foreign power. In 1824 the United States urged upon Great Britain the abolition of privateering, but that entreaty was not heeded. Thirty years later, in 1854, Lord Clarendon advised such abolition. James Buchanan, then the ambassador of the United States at the court of St.

James, replied that this would not be satisfactory unless all the naval powers should agree that war should not be waged against private property on the high seas, in the same way that it had been already agreed that war should not be waged against private property on land. While the law of 1818 was very strict in forbidding American citizens to enter the service of foreign privateers, yet the United States, according to Buchanan's statement, could not agree that it would not use its merchantmen in case of war.

A very important step toward the entire abolition of privateering was taken at the treaty of Paris in 1856. This treaty contained four points relating to privateering, which it was agreed should be regarded as an entirety. These points were to bind only those states assenting, and it was the understanding that those states signing would try to secure the signatures of other states not represented. The four points were as follows: "1. Privateering is and remains abolished. 2. The neutral flag covers enemy's goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag. 4. Blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of an enemy." Nearly all of the secondary states of Europe and America signed the treaty. The United States, through W. L. Marcy, then Secretary of State, refused to sign, but declared that the treaty would be signed "in case the clause abolishing privateering were amended by adding that the private property of the subject or citizen of a belligerent on the high seas should be exempted from seizure by public armed vessels of the other belligerent, except it be contraband of war." The great powers refused to allow this change. When the civil war of 1861 broke out the U. S. government found itself in a very difficult position on this account. W. H. Seward, then Secretary of State, offered the assent of the United States to the treaty of Paris without the amendment noted above; but this was declined by the governments of Great Britain and France if coupled with the condition that it was to be made applicable to the use of privateers by the Confederate States.

Pres. Lincoln's proclamation of April 15, 1861, calling for 75,000 men to put down the insurrection and to repossess the ports, was answered by the granting of letters of marque and reprisal by the Confederate States. Lincoln then, April 19, declared a blockade of all the Southern ports, and threatened the Confederate privateers with punishment for piracy. A long debate took place in the British House of Lords in May and the ground taken by the President was strongly denounced. Finally, England declared that no Confederate prizes should be carried to the British ports. The French declared that privateers might enter their ports with prizes which they could not sell, and that such privateers should remain only 24 hours. The Spanish government enacted a similar requirement. The recognition of the Confederate States as belligerents by the British government was a severe blow to the U. S. government, for the latter was very poorly prepared to show that the blockade was an effective one. The Confederates followed up their advantage by threatening retaliation in case the captured crew of the privateer Savannah were treated as pirates. The trial found the court in doubt as to whether the U. S. government could treat as pirates those of its own citizens who were alleged traitors against it, and so the case fell to the ground. This left the seas open to the Confederate privateers, and the opportunity was eagerly seized. Swift steamers, like the Sumter, Nashville, and Alabama, preyed upon the American commerce.

For years after the end of the civil war the U. S. government sought compensation from Great Britain on the ground that the latter had allowed the escape of the privateers from British ports. In 1871 the

treaty of Washington provided for the settlement of several disputes between these governments, the chief of which referred to those demands known as the Alabama Claims (*q. v.*). The commission met in December, 1871, at Geneva, and, after a hearing of 9 months, agreed upon the "Geneva award." By its terms \$15,500,000 in gold were paid by Great Britain to the United States for the satisfaction of the claims referred to the consideration of the tribunal. Congress subsequently constituted a court to take charge of the Alabama Claims, which court has but recently (1888) completed its business. According to the present agreements between the leading nations of the world, there is no probability that any war hereafter will be attended by such acts of privateering as have been frequent in the past. (F. G. M.)

PRJEWALSKI, NICHOLAS VON (1839-1888), Russian explorer, was born March 31, 1839, at Smolensk. Educated at the Military Academy in St. Petersburg, he became instructor in history at Warsaw. In 1867, at his own request, he was sent to East Siberia, where he spent two years. Then he journeyed southward to the Yangtsekiang, and thence northward, crossing the Desert of Gobi on his way to Irkutsk, which he reached in October, 1873. In his next expedition, 1876-77, he explored Lob-Nor, and the Altyn-Tag Mountains. In 1879 he crossed into Thibet, and had approached within 120 miles of Lassa when he was obliged to turn off towards the Hoangho, and thence back to Orenburg. In 1883 he again crossed the Desert of Gobi, discovered the sources of the Hoangho, and again reached the Yangtsekiang and Lob-Nor in 1885. He gathered a vast zoological collection, containing over 500 reptiles and 5000 birds. He held the rank of colonel in the Russian general staff. His explorations have been published by the Russian Geographical Society, but he also published *Journeys among the Mongols and in the Deserts of North Thibet*, 1870-73 (1875-76); *Journeys in Thibet*, 1879-80 (1883). His travels were translated into English, and the geographical results given in the *Proceedings of the Royal Geographical Society* (London, 1887). He died in Central Asia in 1888.

PROCTOR, RICHARD ANTHONY (1837-1888), astronomer, was born at Chelsea, Eng., March 23, 1837. He was educated at King's College, London, and St. John's College, Cambridge, and graduated B. A. in 1860. He devoted himself to astronomical labors, and from his analysis of the researches of the Herschels, Struve, and others, as well as his own, he formed a new theory of the stellar universe. For a time he was a member of the Roman Catholic Church, but he left it in 1875 on the ground that certain of his scientific views were incompatible with its faith. Proctor was a most industrious writer and lecturer, but never held a really prominent position among scientists. He was made fellow of the Royal Astronomical Society in 1866, and was its honorary secretary for a few months in 1872. He spent the winters of 1873-74 and 1875-76 in lecturing tours in the United States. In 1881 he took up his residence at St. Joseph, Mo., having married as his second wife a lady of that city, and he was naturalized as an American citizen. In 1887 he removed to Marion co., Florida, where he began to build an observatory. He died suddenly on Sept. 12, 1888, at New York, having come thither on his way to Europe, where he was to lecture. His principal works are *Saturn and its System* (1865); *Gnomonic Star Atlas*, recording 324,000 stars (1866); *Constellation Seasons* (1867); *Half-hours with the Telescope* (1868); *Half-hours with Stars* (1869); *Other Worlds than Ours*, with a star-atlas (1870); *The Sun* (1871); *The Moon* (1873); *Transits of Venus* (1874); *Treatise on the Cycloid and Cycloidal Curves* (1878). He also published an interesting pamphlet on *Whist*, and contributed largely to periodicals, besides editing *Knowledge*, a weekly journal. At the time of his death an elaborate work, *The Old and New Astronomy*, was in

course of publication. Proctor's labor was spent in diffusing among the people a general, though not exact, knowledge of astronomy, and in awakening interest in its researches. His successive works combined theory with ascertained facts, and discussed them in such a way as steadily to diminish his reputation with practical astronomers.

PROHIBITION PARTY. This party received its national organization by a convention of nearly 500 delegates from twenty States and the District of Columbia, assembled in Farwell Hall, Chicago, Ill., Sept. 1, 1869. The convention continued its sessions during two days. The call was issued by a committee of those favoring independent political action during the session of the R. W. Grand Lodge of Good Templars, held in Oswego, N. Y., in the month of May previous. The committee consisted of James Black, of Lancaster, Pa.; Prof. Daniel Wilkins, of Bloomington, Ill.; John N. Stearns, of New York city; Julius A. Spencer, of Cleveland, O., and John Russell, of Detroit, Mich. When the convention assembled Mr. D. R. Pershing, of Indiana, called the meeting to order, read the call, and nominated Rev. John Russell, of Michigan, as temporary chairman. On taking the chair Mr. Russell, among other things, said: "The people who fear God and regard the social and moral welfare of their fellow-men are, in all parts of the country, beginning to realize the imperious necessity for some stronger and more formal bond of union between those who favor legal prohibition of the liquor traffic. While separated by other political party lines, and absorbed in other issues, we are unable to act efficiently together for what we conscientiously believe to be the most important moral and political movement of the age. Hence, the object of our meeting is the organization of a separate and independent political party, presenting complete legal prohibition of the manufacture and sale of alcoholic drinks as its paramount issue." These sentiments were heartily applauded by the convention. Upon request of the chairman, Rev. Dr. Evarts invoked the divine blessing. After the appointment of secretaries and the usual committees, Hon. James Black, of Pennsylvania, was chosen permanent president, together with a vice-president from each of the States represented.

The committee on platform and resolutions was appointed as follows: Rev. J. C. Stoughton, of Illinois; Rev. John Russell, of Michigan; Henry D. Cushing, of Massachusetts; D. R. Pershing, of Indiana; L. B. Haines, of Ohio; Dr. S. W. Wilson, of Wisconsin; O. K. Harris, of District of Columbia; Timothy Parsons, of Missouri; M. D. Bartlett, of Minnesota; E. C. Judson, of California; Dr. Chas. Jewett, of Tennessee; Rev. J. H. Chase, of Vermont; Rev. Wm. Goodell, of Connecticut; Frank Walker, of Iowa; Hon. Gerritt Smith, of New York; S. B. Ransom, of New Jersey, and Hon. Robt. M. Foster, of Pennsylvania. A preamble and six resolutions were presented, carefully considered, and adopted as a platform. The second resolve, expressive of the chief intention of the party, is as follows: "That the traffic in intoxicating beverage is a dishonor to Christian civilization, inimical to the best interests of society, a political wrong of unequalled enormity, subversive of the ordinary objects of government, not capable of being regulated or restrained by any system of license whatever; but imperatively demands for its suppression effective legal prohibition, by both State and national legislation."

Previous to this convention, however, the question had been tentatively discussed in temperance societies, lectures, and in newspapers, and initiative local organizations had been effected in several of the States. Michigan led the way by a small convention of about forty persons, held in the city of Detroit, Jan. 8, 1867. As there was no political canvass at the time this meeting simply declared by resolution in favor of a separate party, and appointed a State committee au-

thorized to call future conventions. Illinois followed by a much larger assemblage, of some 200 delegates, at Bloomington, Dec. 9, 1868. And to Ohio belongs the honor of placing the first State ticket in nomination by a convention held at Mansfield, July 14, 1869. For this ticket 679 votes were cast in that State.

The following is the opening sentence of a call for the first national nominating convention, issued Dec. 9, 1871, and signed by John Russell, chairman, and Gideon T. Stewart, secretary: "The friends of the National Prohibition party are hereby requested to assemble in national convention at the city of Columbus, O., on the 22d day of February, 1872, at 11 A. M., for the purpose of putting in nomination candidates for the offices of President and Vice-President of the United States, to be supported at the next ensuing national election; and of transacting such other business as the convention, when assembled, shall deem advisable." At the convention, assembled pursuant to the above call, Hon. Henry Fish, of Michigan, was chosen temporary chairman, and subsequently Hon. S. B. Chase, of Pennsylvania, was elected to preside permanently over the deliberations. Prof. Elroy M. Avery, of Ohio, was elected secretary, with Capt. Chas. P. Russell, and several other assistants.

This convention adopted a broad platform consisting of a preamble and 17 resolutions on various subjects; the two subjects of chief importance which received unequivocal endorsement were the complete legal outlawry of the liquor traffic, and impartial, yet properly qualified, suffrage, without distinction of "sex or race." Hon. James Black, of Pennsylvania, received the nomination for the Presidency, and Rev. John Russell, of Michigan, for the Vice-Presidency, at the hands of this convention. For this ticket there were cast a total of 5508 votes, in six States—Connecticut, Michigan, New Hampshire, New York, Ohio, and Pennsylvania.

The second national nominating convention met in the city of Cleveland, O., May 17, 1876. Rev. H. A. Thompson, D. D., of Ohio, presided, and Charles P. Russell, of Michigan, was secretary. Hon. Green Clay Smith, of Kentucky, was made the nominee for the Presidency, and Hon. G. T. Stewart, of Ohio, for the Vice-Presidency. The platform of 1872 was reaffirmed, and 15 new resolutions were adopted. This year there were cast 9757 votes for the Presidential ticket by 17 States.

On June 17, 1880, the party held its third nominating convention, again at Cleveland, O., and Rev. A. A. Miner, D. D., of Boston, Mass., presided. Gen. Neal Dow, of Maine, was unanimously chosen as Presidential candidate, and for Vice-Presidential nominee Rev. H. A. Thompson, of Ohio, was selected. The ticket received 11,610 votes.

The great social and semi-religious temperance revival which spread over the country during the previous decade had by 1881 fairly crystallized into its logical sequence of prohibition sentiment. But many of the more active new workers now in the field were but imperfectly informed regarding the real status of the Prohibition party. Hence, at a convocation composed chiefly of such new recruits, held at Lake Bluff, Ill., in August, 1881, an organization known as the "Home Protection Party" was effected. However, at a subsequent conference, convened at Chicago Aug. 23, 24, 1882, composed of 341 delegates, there was little trouble in effecting a union of the two organizations under the name of "Prohibition Home Protection Party." Even this change of title lasted only two years, when the original name of "Prohibition Party" was restored by a vote of the next national nominating convention, which was held in Pittsburg, Pa., July 25, 1884.

This convention marked a bright era in the history of the party. There were 602 delegates present. The platform, although newly constructed in form, was not essentially changed in sentiment. Prof. Samuel

Dickie, of Michigan, was selected to preside over the deliberations. Ex-Gov. John P. St. John, of Kansas, received the nomination for the Presidency, and Hon. William Daniel, of Maryland, for the Vice-Presidency. More than 150,000 votes were cast for this ticket in the nation. The late Hon. John B. Finch was made chairman of the national committee, and infused new life and force into the operations of the party.

After the death of Mr. Finch, which occurred Oct. 3, 1887, the present incumbent, Prof. Samuel Dickie, of Michigan, was called to that position.

The fifth national convention, held at the city of Indianapolis, Ind., on May 30, 31, 1888, composed of 1046 delegates, nominated Gen. Clinton B. Fisk, of New Jersey, as its candidate for the Presidency, and Rev. Dr. John A. Brooks, of Missouri, for the Vice-Presidency. It is reckoned that 242,984 votes were polled for the ticket, being about 100,000 more than were cast for the party in 1884.

The comparatively slow progress of the movement is a source of discouragement to persons of sanguine temperament. But patience is an essential virtue in a reformer. Drunkenness and its adjunct, the liquor traffic, constitute a chronic disease of the body-politic. Such difficulties yield but slowly even to the best of treatment. Prohibitionists regard the temperance reform as a complex question, both social and political. In its legal relations it is strictly a political measure, demanded by strong moral considerations. The legalized liquor traffic is a counter-educating and counter-acting force, standing directly in the way of all moral efforts to save society from the direful consequences of using alcoholic intoxicants.

License or taxation provides for the regulation and continuance of the business, but not for its suppression. Prohibition is the only line of policy which aims logically at, and seriously contemplates the utter overthrow of, the dram-shop system. Therefore the paramount issue which the Prohibition party presents is, "Prohibition versus Legalization of the Liquor Traffic." They indict the business of making and vending intoxicating beverages as grossly immoral in its nature and tendencies, in violation of the sound principles of political economy, and at variance with every object of good government, constituting a political wrong of unequalled enormity. For this "gigantic crime of crimes" absolute prohibition is the only adequate remedy, to secure which involves the responsible agency of a political party.

They regard the nation as being again confronted with the solution of a great public question, which is of so radical a nature as to be utterly incapable of any just compromise. The question is not whether we shall have a few saloons or many, but whether we shall have any or none at all. Only such a condition can justify the formation of a new political party in this country, but when such a political question does present itself for settlement, there is no other way out of the difficulty.

Postulating, as somewhat axiomatic, that "Government by the people involves government through parties," and that "political parties are either strong or weak to handle public questions in proportion as the members are united or divided on the particular question to be adjusted," the main argument against the older parties and in favor of the new may be placed in syllogistic form thus: Where the members of a political party are radically and irreconcilably divided on any question, it thereby becomes impossible for the party to give positive and effective legislation on that question. But members of the two leading parties are radically and irreconcilably divided on the question of prohibiting the liquor traffic. Therefore, it is impossible for either of them to give positive and effective prohibition of the liquor traffic. Hence the need and existence of the radical Prohibition Party. (J. R.)

PRONGHORN, or PRONGBUCK. See ANTELOPE, AMERICAN.

PROPERTY. Property consists of material things, and rights growing out of such things, to and of which one has the exclusive right and possession. The earliest division of property known to the English law was into "real" and "personal." So far as the subject matter is concerned, real property includes land, minerals in it, what is grown or built upon it, and certain rights which are connected with or issue out of it. All other forms of property whatsoever are personal.

REAL PROPERTY.

The law governing real property was developed under the feudal system. The theory of this system was that the king was the absolute owner of all the land in the kingdom and granted portions of it to certain of his subjects who, in turn, subdivided their respective shares and granted portions to others. What was conveyed by these grants, however, was not the land itself but an interest or an estate in the land, and therefore every one who held land, except the king, was called a tenant because he held under some superior lord, and all held, finally, either mediately or immediately, of the king, who was the lord paramount. The interest in land which a subject had was called his estate.

All subjects held their lands feudally; that is, under some superior to whom they were bound to render allegiance and service in return for the land; the king held allodially; that is, he held the land itself, and was under no obligations to any superior.

The tenure by which these tenants, if they were freemen, generally held the land was upon condition of performing military service; of following their lord to the war and furnishing from among their retainers a certain number of armed men. The tenant also swore allegiance to his lord and promised to be subject to his commands. If the tenant was not a freeman the services he rendered were of some menial kind.

There were certain incidents connected with this military tenure. The tenant was bound to ransom his lord if he was captured; to pay the expense of making his lord's eldest son a knight; to give his eldest daughter a marriage portion. He was also bound to pay for the privilege of being his lord's tenant. The lord was entitled to the wardship of his tenant's heir if he was a minor. The tenant was obliged to pay for the privilege of transferring his estate, and, by reason of the lord's superior title, the land reverted to him when the tenant died and left no heirs.

As these military tenures became vexatious on account of the uncertainty of the amount and time of service which the tenant was to render, they were all changed, in the reign of Charles II., into what was called tenure by free and common socage, when the military feature was abolished and the service upon which the estate was held was of some certain and honorable nature, as payment of money, or performance of some work or duty, to the lord. This tenure was still feudal in its nature and had many of the incidents of military tenure, but the amounts or fines to be paid were fixed by statute, and the service was rendered less onerous.

This socage tenure, as it is called, is probably the one under which lands in this country were held under the English grants. Every acre, as it has been said, was held either mediately or immediately of the king. By the Revolution the sovereign, proprietary, and territorial rights of the crown of Great Britain passed to the people of the various colonies. As the people of each colony took the place of the former sovereign, and the social condition which grew up was entirely different in its structure from the old order, the superior lords disappeared, and most of the incidents of the feudal tenure fell into disuse. Whether the holding of lands in the United States is feudal or allodial is a question about which the opinions of jurists of equal eminence differ. No State, it is believed, ever asserted

the claims of tenure and fealty from its citizens by reason of their holding of land. Some States have rejected the existence of tenure and fealty; and others have, by statute, abolished feudal tenure. Some of the courts of last resort have declared that lands are held allodially. Perhaps the true view is, that while the nomenclature of real-estate law and the forms of conveyancing still suggest some traces of feudal tenure, lands are actually held as nearly allodially as they can be when the holders are members of society under any form of government. Allegiance of the citizen to the government is still obligatory, but is independent of the holding of real estate. And the claims of eminent domain and escheat are not put upon the ground of any superior title in the government, but are enforced by reason of the agreement and consent of the citizens.

Land titles in parts of this country—as Louisiana and some of the South-western Territories—are derived from the civil, and not from English common, law. The nature of the estates, and the rights and obligations of their owners, are, however, essentially the same for all practical purposes at present under either system.

The interest which a man has in lands is still called his estate, and may be of greater or less duration. Under the feudal system a man could not have possession of the soil unless he had a freehold estate, which was defined to be "the possession of the soil by a freeman." This did not mean the unqualified and absolute ownership of the land, but the possession of it under the superior rights and title of his lord, as distinguished from the mere right to use the soil. Under the artificial system of the English law it was thought a freeman could not have the possession of the soil for a less period than his life—a freehold estate came to be an estate for life at least; and so now the smallest estate in real property is an estate for life, and a freehold is either an estate for life or a greater interest. An estate for life may be created to last either during the life of the person to whom it is granted or during the life of some other person. In either case its existence is measured by a life, and the rights of the owner are limited to that period; he cannot sell a larger interest than he possesses, nor can he dispose of it by will. At the expiration of the life the estate ceases to exist. A life-estate may be created by deed or will or by operation of law. Upon the death of a husband or wife the law gives to the survivor an estate for life in the lands of the decedent. What portion of the decedent's estate shall go to the survivors is generally fixed by the intestate laws of the different States. The homestead estate is an interest in lands which is created by statute in most of the United States. Its general incidents are similar to those of a life-estate, although it sometimes continues after the death of the husband for the benefit of the wife during widowhood, or of the minor children. This interest is intended for the benefit and support of the family, and is therefore allowed to a householder, who is also the head of a family, or to the widow and minor children. Sometimes, however, it is allowed to any householder, although unmarried. It cannot be taken in execution for the owner's debts, and its disposal is generally restrained so far as not to allow the object for which it is created, that is, the support of the family, to be defeated.

The largest freehold known to the law is an estate in fee-simple, which is created by granting or devising land to one and his heirs forever. This interest is without end. The owner may change, but the estate will not diminish. The then owner may grant or devise out of his fee-simple a smaller estate, as for life, to another person, but at the expiration of this life-estate the fee will return to the owner, or those who then represent him; or he may, by selling his fee, give to the purchaser the same unending interest that he possessed. He may dispose of his entire interest by will, subject to the rights of his surviving wife and to special statutory limitations peculiar to individual States, and, if he die without a will, his estate will

seek for his heir to the remotest degree of relationship.

An interest which is smaller than a life-estate or freehold is an estate for a term of years, or the usual tenancy, as it is generally understood. The tenant has not the possession of the soil, but only the use of the land. Of so much dignity and value did the old law esteem the freehold that an estate for even a period of years very much longer than an ordinary life was considered of less importance. And this theoretical distinction is still observed. This estate is in some respects peculiar, for while the property is itself land, the interest of the tenant, being less than a freehold, is personal property and not real estate, and, at the same time, as to most of his obligations in respect of his property, to all persons except his landlord he is held responsible practically as the owner of the land. The mutual rights and duties of the tenant and his landlord are generally regulated by contract between them, but, in the absence of any agreement, they are governed by the rules of law usually applicable to real property. The disposition of the estate, if the tenant dies before the expiration of his term, is governed by the rules which regulate personal property, and not those which control the descent of realty.

An estate may be created to begin or end upon the happening, or not happening, of some event, and, in this case, it is said to depend upon a condition. Most of the cases where real estate is given as security for debt are conditional estates; that is, an estate granted upon condition that it shall cease when the debt is paid.

The whole of an estate may be granted or devised to one person, or it may be divided into portions for successive periods, and each be given to a different individual. So a fee-simple may be carved up so as to take out of it several smaller estates before the final vesting in possession of the fee. As, however, the policy of the law is against any restraint upon the freedom of alienation, the limit of time within which these smaller estates may be created is generally regulated by statute.

A person may have certain rights in the land of another, and these are regarded as interests in real estate. A man may acquire the right of way over the land of another person; and adjoining owners have certain mutual rights of support in the houses or lands of each other.

An interest in land may be divided into a legal and an equitable estate, and the owner of each has his own special enjoyment and rights. This is accomplished by giving the legal estate to one as trustee for another; the latter is said to have the equitable estate.

The trustee is possessed of whatever extent of interest is necessary to enable him to carry out the provisions of the trust, and his management of the estate is intended to be for the benefit of the person for whom he holds it. The interests of the beneficiaries, or equitable owners, and whatever rights of enjoyment or disposal they have, are usually defined by the terms of the instrument which creates the trust. These estates are created for a great variety of purposes; frequently for the benefit of some one who, on account of some disability, cannot hold the legal estate, or for some improvident person who would squander the estate if he had full control, but for whose support some provision is desired. They are also created in order to preserve the estate intact for the person who is to be finally entitled to it, while the income is to be distributed to different individuals for a period of years, or one or more lives. The duty of the trustee is to hold and manage the estate, and distribute the income as the trust directs. To make a good trust the trustee must have some actual duties to perform; if he is made the depository simply of the legal title, the law will strike down the trust and vest the legal as well as the equitable estate in the person who is entitled to the latter. When the purposes of the trust have been

accomplished, and the equitable estate vests in those who are finally entitled to it, the trust dies out, and the legal and equitable estates merge in the same owner.

The owner of an estate may be one individual, or several who are joint owners. These joint owners may have the same quantity of interest, and hold by the same title, and acquire their estate at the same time; or they may have simply one possession of the same piece of property but for different interests—as one for life, the other in fee—and they may have acquired their titles at different times.

The extent of the owner's enjoyment in, and right of disposal of, his estate depends upon the extent of his interest in the land. The right of disposal by will is, however, restricted by statutory regulations, in many of the States, in two directions: first, in fixing at what period of time before the death a devise or grant for charitable uses can be made; and second, what share of the estate cannot be devised but must be left for the decedent's family. Subject to these limitations, he has, generally, the right to do as he pleases with his own property, provided he does not injure the rights of others in the same property or infringe upon the rights of the use and enjoyment of his neighbors in their possessions.

It is a general rule in this country that real estate is liable for the payment of the debts of its owner. A creditor can, by legal process, put his debt in such a position that it becomes a lien, under statutory limitations as to time, etc., upon the real estate of his debtor, and when this is done, a transfer of the property by the owner will convey it subject to this lien. Real estate is also liable to be taken by the government, either by taxation or under the right of eminent domain. This latter right, however, is subject to the conditions that it can be taken for the *public benefit* only, and upon due compensation to the owner.

Title to real estate is defined by Blackstone to be "the means whereby a man cometh to the just possession of his property." Where the right of possession, the right of property, and actual possession exist in the same person, he has a perfect title. Title may be acquired by occupancy. This is the taking possession of land which has no owner, or the taking possession of land which belongs to another and holding the same adversely to the title of the real owner. It may also be acquired by the act of the parties, as by gift or sale—and this, in the case of real estate, must be by a deed—or by will; or by the operation of law, as by a judicial sale, a sale under legal proceedings, or by forfeiture; or by descent, where the law casts the property upon whomsoever it designates to be entitled to it, in case the owner dies without a will; or by escheat, which is a proceeding by which the title to lands, where the owner dies without any heirs, becomes vested in the commonwealth.

PERSONAL PROPERTY.

Personal property includes every species of property that is not real estate, or an estate in land. To understand what this expression means it is necessary to recall what the old law designated an "estate in land," to wit, the possession of the soil by a freeman. As the smallest estate of freehold was the life-estate, any interest which was less than this in value or dignity was simply personal estate. The word "estate" does not fairly express the owner's interest in reference to personal property. For "estate" meant his interest in land, whereas in the case of personalty the owner possessed not an "interest" in it, but the very thing itself. The property is designated as "personal" because, unlike land which has a fixed location and is immovable, this can accompany its owner's person wherever he goes, subject only to the limitation inherent in the particular case. After the possession of the soil, the next interest in it is the

See Vol. XVIII.
p. 664 (p. 677
Am. Rep.).

right to use it for a certain time. As, therefore, personal property includes, as to its subject-matter, both land and other things, the first division of it is into chattels real, including every interest in land less than a freehold; and chattels personal, all other things whatsoever. Chattels personal are said to include things in possession and things in action; and by the latter is meant the right to sue, as for the recovery of a debt. This division is incomplete, for there is a right to sue for a specific thing when one has been deprived of it; and, on the other hand, there are certain species of intangible property which imply more than a right to sue, as one's interest in a partnership or in the stock of a company. A more accurate division of chattels personal would be into things corporeal, including all tangible, visible property; and things incorporeal, or all property which is not tangible and visible. Property may pass or be changed from one species into another. Crops and minerals, when not separate from the land, are part of it, but by severance become personal property; and lumber which is used for the construction of a dwelling becomes part of the realty. Gold, which is realty before it is mined, becomes by severance a corporeal chattel, the ownership of which is lost by a loan of the money coined from the gold, and in its place the lender has simply the incorporeal property, the debt for which he may sue. In animals that are wild by nature one has a qualified property so long as they remain upon his premises.

Certain kinds of property lie along the border line between realty and personalty. These are things which, from their nature, would be considered personal property, but, by reason of their connection with land, pass as part of the realty. Heirlooms, as family pictures, armor, title-deeds, are strictly chattels, but as formerly their importance consisted principally in their connection with the land, they were considered part of the inheritance and, at the death of the owner, would go with the land to the heir and not to the executor as personal property. They are of little importance in this country, as title-deeds are generally recorded, and, under the various intestate laws, there is less distinction than formerly between the heir and those who are entitled to the personal estate. Emblements, or the products of the soil, may be realty or personalty. The question as to which they are is of importance chiefly between the landlord and the tenant upon the termination of a tenancy. Fixtures, also, are personal chattels which are attached to the land. Whether these are strictly chattels or become part of the realty are questions of great importance in transactions that may arise between a seller and purchaser of land, or between the heir and executor of the deceased owner of land; or between a mortgagee who has loaned money upon the security of premises used as a mill or factory, etc., and the creditor of the mortgagor who is seeking satisfaction out of the personal property of his debtor; or between a landlord and tenant when the dispute is as to what things the latter has the right to remove at the expiration of his tenancy. In determining these respective rights, great attention was formerly paid to the manner of the connection of the chattel to the land, the rule being that whatever was built into the land, including the buildings, became part of it and belonged to the owner of the realty. But now greater stress is laid upon the intention of the parties and the use for which the fixture was intended, and very little upon the nature of the physical connection. The leaning is strongly in favor of allowing the tenant to remove all fixtures placed upon the premises by him for the purpose of his trade.

Among many of the most valuable species of property in modern times are incorporeal chattels, as stock in corporations, or patent- or copy-rights.

Ownership in chattels may be transferred either by delivery of the chattel itself, or by delivery of that

which is evidence of its ownership. Personalty has also some of the incidents of realty. A chattel may be owned by one person, or by several as joint owners. Interests, analogous to present and future estates in realty, may be created in chattels. This, of course, is true generally of chattels not intended for immediate consumption or which are perishable, but especially of those which yield an income. The chattel may be given to one for a term of years, or for life, and, upon the termination of this interest to another. Chattels are frequently the subjects of deeds of trust. The same general rules against creating perpetuities apply in case of chattels as in realty.

There is a difference between land and personalty in the rules of law which govern each. Land has a fixed locality, and the rules of law which control it are those of the jurisdiction in which it lies, no matter what may be the domicile of the owner, while the law which controls personal property is, generally, that of the domicile of its owner. While this is generally true, there are some exceptions to it; as, in the case of the transfer of stock, the manner of doing this may be regulated by the law of the jurisdiction of the corporation, although that might not be the holder's domicile.

Title, which is the true foundation of ownership, may, in the case of personal property, be acquired by occupancy; by the act of the parties; by the act of the law. Possession is evidence of title, but not complete. A perfect title is where possession and the right of possession are in the same person.

Occupancy is the taking possession of a chattel which belonged to no one, with the intention of appropriating it. One may acquire title to a chattel which has no owner by taking possession of it as his own, or by finding a lost chattel, to which the finder has title against all the world except the real owner. Title is acquired in this way, also, to the increase of animals, the offspring being the property of the owner of the female; and also to the products of the exertions of one's brain, as his inventions.

Title by the act of the parties is by gift, where a chattel is voluntarily transferred from one to another; or by sale or exchange, where the property is transferred for a price, or for some other article; or by will. Title by the operation of the law is where the property is transferred by a judicial sale, as upon execution for the payment of a debt; or by the intestate law when the owner dies without a will. In many States the personal property of one who dies intestate and without leaving any known person who may be entitled to his property under the statutes of distribution is vested in the commonwealth by process of escheat.

LITERARY PROPERTY.

It seems to be agreed that the right to property is founded upon occupancy, or first possession. "Occupancy," says Blackstone, p. 356 (p. 316 Am. Rep.), "is the taking possession of those things which before belonged to nobody."

This is the true ground and foundation of all property, or of holding those things in severalty, which by the law of nature, unqualified by that of society, were common to all mankind. When it was once agreed that everything capable of ownership should have an owner, natural reason suggested that he who could first declare his intention of appropriating the thing to his own use, and actually took it into possession, should thereby gain the absolute property of it. Upon the ground of occupancy depends one's right to what is called his literary property. Literary property is the right one has to the possession, use, and disposal of his own intellectual productions. A person is pre-eminently the first possessor or occupant of his own ideas, thoughts, and sentiments. The possessor of these mental products may either keep them to himself or by speech freely give them to the public, or put them into the form of property by committing them to

manuscript or print. When these thoughts take the form of property the law treats them as it does all other property. The owner has the right to claim protection against the improper use or appropriation by others of his property; he may give it away or abandon it to the general public; he may derive an income from it, may sell it, or dispose of it by will. Although it is necessary, in order to receive the protection of the law, that literary property be put into some form, the author's property does not consist in the form or the substance upon which his mental productions are inscribed, but in the thoughts, sentiments, and ideas themselves.

The author's rights in and to his property depend upon what is called the common law and certain statutory enactments. His right to his own exclusive control and disposal of his manuscript has never been doubted, but whether he had a common law copyright, that is, a right to multiply and distribute for his own sole benefit copies of his work, or whether by such multiplication and distribution the author did not lose his exclusive right by abandonment to the public, have been debated questions. These differences of opinion have been further emphasized by the consideration of the effect of copyright statutes. The various opinions upon this subject seem to group themselves into three views: First, that at common law an author had the right of multiplying copies for his own benefit; secondly, that he had not such right until it was given to him by statute; and, thirdly, that, although he had a copyright at common law, the statute took it away from him and gave him instead a statutory copyright, which thereafter was the only one he possessed. In the history of judicial discussions upon the subject of the author's right of property all of these views at times have come to the surface. In some of the earlier cases injunctions against the piracy of books were granted upon the ground of the author's common law copyright. In 1710, in the reign of Anne, the first copyright statute was passed. The first view of this statute seems to have been that it did not take away the common law copyright, but was intended to afford additional remedies against piracy. In 1769 the question of the piracy of *Thomson's Seasons* came before the court. In this case (*Millar vs. Taylor*, 4 Burr. 2303) the statutory copyright had expired, and a majority of the court held that literary property did exist at common law and was not taken away by the statute. The same question again presented itself for decision in 1774, in the case of *Donaldson vs. Becket* (4 Burr. 2408), which was carried upon appeal to the House of Lords, where the final judgment, which has been the law from that day to this, was that the statute of Anne had taken away the author's common law copyright, and the only rights of publication he had thereafter were such as the statute secured to him. And this decision was followed by the Supreme Court of the United States, when the same question presented itself, in the case of *Wheaton vs. Peters* (8 Pet. 591), under our own statute of copyright.

Copyright statutes are intended to protect the author's rights in the multiplication and distribution of copies of his work. In most other respects his rights are governed by the usual common law rules applicable to personal property. The great value of literary property, as a source of gain, consists in its owner's ability to make and circulate copies without interference or competition from others. The author's control of his manuscript is exclusive and absolute, but by dedicating his property to the use of the public he loses this sole possession. Publication of a work intended to be protected by the copyright statute, without compliance with the requirements of that act, is a dedication to the public. Literary property may be dedicated to the public by any act of its owner which shows that he abandons his exclusive right of property. Such dedication, however, must be the free, voluntary act of the owner, and not of some one else without his

consent or knowledge. The mere gift of a manuscript confers no right to publish. A restricted circulation of copies, as among friends, indicates no abandonment of the owner's right of property; nor does the use of a manuscript for a particular purpose, as lectures read to a class, give any right to a student or hearer to print and sell for profit, or in any way interfere with the lecturer's rights. (*Abernethy vs. Hutchinson*, 1 H. & T. 39; *Morrison vs. Moat*, 1 Edw. ch. 25; *Miller's Appeal*, 15, W. N. C. (Pa.) 27).

While intellectual productions must assume some form in order to be recognized, identified, and protected as property, no particular form is prescribed, and whether the property exists in manuscript or print the owner's rights are equally protected if he has done nothing to prejudice them. The writer of a letter does not lose his right of property in it by sending it to his correspondent. The sending of the letter is a gift to the receiver of it of the material upon and by which it is written, and the writer loses control over his manuscript to the extent that he cannot demand its return; but no rights of publication are conferred upon the one to whom it is sent, and the writer could restrain such publication, and his right to do this is upon the ground that he has not parted with his property. There may be cases where, perhaps, for his own vindication, the receiver of a letter which reflected upon him might have the right to publish, but some necessity of the kind must exist to justify such a course.

A very common form in which literary property appears is the daily newspaper. These are rarely, if ever, copyrighted. They certainly come within the language of the act and could be copyrighted if desired. But as the great object of such a paper is the first circulation of news, not much would be gained by simply providing against the piracy of its contents. Of course, the publication of valuable material, as letters, or a novel, may be protected by copyrighting such matter for a newspaper or any serial publication. A copyright by the editor of any matter published in his paper would not give him the right to publish it in any other form. The title of a newspaper is valuable property, and the proprietor can be protected against the unlawful use of it by others, but he cannot secure this protection by copyright, as a title cannot be copyrighted by itself, but only as part of a work.

A dramatist's rights in his property differ somewhat from those that pertain to any other kind of literary property. He may have his copyright in it as a literary production, and also his playwright or the right of representation upon the stage. And as the value of a book, as a source of profit, consists in the right to multiply and sell copies, the value of a play consists largely in the right to perform it and prevent others from doing so. It is a recognized rule of law that where any kind of literary property is not included within the terms of a statute of copyright the owner's rights are to be determined by the ordinary rules of the common law applicable to such property. The U. S. copyright statutes refer to plays in two respects only. They provide that when an author obtains a copyright for a dramatic composition he only is entitled to represent, or cause to be represented, such play, and, further, that for the unauthorized publishing of any one's manuscript damages may be recovered. If, therefore, a play is printed, the only right of performance is the one conferred by the statute, and, according to the rule which has been followed in the case of copyrighted books, the statute has taken away the author's common law rights. But as the statute nowhere refers to manuscript plays, it would seem that the author's common law rights in them still exist to their fullest extent. And as the author of a book had at common law the exclusive right to multiply copies—for the decisions say only that that right was taken away by the statute—the dramatist had and still has the exclusive right to the performance of his drama. The question whether the public performance of a

manuscript play by its author or owner is a dedication of it to the public, so that thereafter any one could lawfully reproduce it, has not been squarely decided, but the tendency of the decisions seems to be in the direction of holding that such performance is not a dedication and the unauthorized reproduction of the play is a piracy. It has been decided that the performance of a play by its owner does not prevent him from afterward having it copyrighted; and that the performance of a drama which has been obtained from its owner by fraud, breach of trust, or unfair means, will be prevented. (*Keene vs. Wheatley*, 9 Am. Law Reg. 33; *Boucicault vs. Wood*, 2 Biss. 34.) Some courts have decided, and others have to some extent approved this view, that reproducing a play from memory by one who has seen its performance is not obtaining the play by unfair means. This view has, however, been repudiated by courts of equal authority, and certainly seems to be entirely inconsistent with common sense.

Literary property must possess the qualities of innocence and originality in order that its possessor may demand the protection of the law. The law does not generally prohibit the publication of works which are not innocent, but it refuses protection to the owner of such works when others have infringed his rights. It is impossible, perhaps, to give an accurate definition of "innocence" within the meaning of the law. The judicial conception of this quality has varied considerably, and protection was formerly denied in many cases where now it would be granted without question. In England, some years ago, an injunction to restrain the pirating of certain lectures on the "Physiology, Zoology, and Natural History of Man," was refused upon the ground that they contained passages hostile to natural and revealed religion and the doctrine of the immortality of the soul. (*Lawrence vs. Smith*, 7 Jacob, 471.) And the owner of an edition of Byron's *Cain* was refused protection, as, in the opinion of the court, that production was intended to bring into discredit portions of the Scriptures. (*Murray vs. Benbow*, Shortl. L. Lit. 8.) In this day, however, of free discussion and expression of sentiment it may be safely said that no work which discusses, criticises, or teaches any branch of knowledge, faith, or practice, or which expresses sentiments at variance with those generally held on any subject, would be condemned as not innocent. But works which are openly blasphemous, indecent, immoral, or libellous, or put forth false pretences to authorship which are calculated to deceive the public, still fall under the ban. The certificate of copyright has no effect upon the question of the innocence of the work.

Originality is, perhaps, as incapable of exact definition as "innocence," but there is a legal conception of originality, and this is what the law requires a literary work to possess. The law does not merely refuse protection to a work which does not possess its own originality, but it may restrain the reproduction of the identity of a former work. Every original work possesses an identity; this consists, says Blackstone, "in the sentiments and the language. The same conceptions clothed in the same words must necessarily be the same composition; and whatever method may be taken of exhibiting that composition, to the ear or the eye of another, by reciting, by writing, or printing, in any number of copies, or at any period of time, it is always the identical work of the author which is so exhibited." Any work which appropriates this identity of a former work, in whole or in part, is not an original composition. This originality, however, does not mean absolute newness, for there is no such thing; nor does it exclude all imitation. It does not mean the addition of something new, as a part, to something old, as a part. No number of chapters added to one or more chapters of a work formerly published would make the second publication an entirely new work. The newness must consist in some essential feature of the work. There must be original labor in the plan, selection, arrangement, or

composition. Every word of a work may be found in a subsequent one and yet the last production be entirely original; as a Concordance of Shakespeare. An abridgment, compilation, translation, etc., if the results of original labor, fulfil the requirements of the law. An author does not forfeit his claim to an original production by employing some one to assist or prepare certain portions of his work.

Literary property is as much the subject of contract, under the statutory requirements and limitations, as any other species. The owner of a manuscript may sell it outright, or part with an interest in it. He may retain the property and license its publication for a term of years, or within a certain territory. The licensee to publish for a certain time would probably carry with it the right to sell copies of the work unsold at the termination of the period. The only satisfaction the law affords for the breach of a contract to write a work is an action for damages. It would be impossible for a court of equity to order a specific performance of such a contract, as a court could not determine, after performance in obedience to its order, whether the original contract had been actually carried out. Where the breach consists not only in a refusal to carry out the contract but in an attempt to perform the same work for some one else than the person with whom the original contract was made, a court of equity can restrain such attempt. No contract to write a work which the law regards as not innocent, as to violate the copyright of another, can be enforced.

Where an author who is producing a literary work under contract with a publisher dies during the progress of the work, as his contract is one of personal skill it dies with him, and his executors cannot be compelled to finish the work or pay damages for its non-completion. The general rule of law is that all one's property is liable to seizure to pay its owner's debts. This, however, is true to a limited extent only in the case of literary property. The products of literary property, the books published, may be taken in execution. And while a manuscript, or the stereotype plates of a book, as a piece of property, may be seized under a levy, such seizure confers upon the officer, or upon one who purchases at his sale, no right to publish for the benefit of the author's creditors or of any one else, because all that is sold is the manuscript or the metal of the plates, and the literary property—the intangible thing of which the manuscript is the form—is not taken. It might be possible, however, under some circumstances, for equity to come to the assistance of creditors, by compelling the taking out of a copyright and the publication of copies.

The injury to literary property which the law is most frequently called upon to redress is piracy—which is the illegal use of another's literary property. As property of this kind is generally protected by copyright, piracy is sometimes defined as the infringement of another's copyright. The literary property must be appropriated or used to render one guilty of piracy; merely stealing a manuscript is not this offence. Where, for any reason, the law does not recognize the right of property, the appropriation of it is not piracy.

The mere taking of another's literary property constitutes this offence, without regard to the intention with which the act was done, and, therefore, ignorance that the property belonged to another, or the absence of any intention to injure, is no defence. Of course, a flagrant intention to injure might be ground for giving greater damages. There may be no pecuniary damage done and the offence would be complete—as in the case of the publication of a work which had been printed for private circulation only and not for profit. Nor is it necessary that the piracy be committed for profit; it may be done for convenience merely. As some one's property must be injured to constitute piracy, the offence is not committed by resorting to the same sources of information, provided such sources are common and open to all alike. There is a fair use of

literary works, already published, which the law recognizes and allows. What is such fair use must be determined by the circumstances of each particular case. It is perfectly fair to use portions of a work for criticism or review, but criticism must not be made a guise for the publication of another's work. And in the same way fair quotation is allowable. The remedies for piracy are an action for damages or an injunction to restrain the act.

Copyright Statutes.—Prior to the adoption of the Constitution of the United States many of the States had passed copyright statutes, but as these were inadequate for the protection of authors outside the boundaries of each State, a provision was inserted in the Constitution giving Congress the power to enact such statutes. The first act of this kind was passed in 1790, and after several amendatory acts were passed from time to time, finally the act of 1870 came into force which repealed all previous laws, and, with a few alterations, constitutes the copyright law of to-day.

The provisions of this act are briefly as follows: Any citizen in the United States or resident therein, who shall be an author of any book, or dramatic or musical composition, and his executors, administrators, or assigns, by complying with the provisions of the law, have the sole liberty of printing, reprinting, publishing, and vending the same; and in the case of a dramatic composition, of publicly performing or representing it, or causing it to be so done. And authors may reserve the right of dramatizing or translating their own works. Copyright is also given in maps, charts, cuts, prints, photographs, paintings, drawings, chromos, statuary, models, and designs.

The copyright is granted for twenty-eight years from the time of recording the title. The author, if living and a citizen of the United States or resident therein, or his widow or children, if he be dead, may have the same exclusive right continued for fourteen years more by complying with the provisions as to recording and advertising within six months before the expiration of the first term. A copyright can be assigned by an instrument in writing duly recorded.

To obtain a copyright there must be deposited with the librarian of Congress the printed title of the book, etc., and two copies of the book. A fine is imposed for failure to deliver these copies.

No action for the infringement of a copyright of a book can be maintained unless there is inserted in the several copies of each edition published, on the title-page or the immediately following page of a book, or on some visible portion of a dramatic or musical composition, maps, etc., the following statement, "Entered according to the act of Congress in the year— by A. B., in the office of the librarian of Congress at Washington," or "Copyright," together with the year the copyright was entered, and the name of the person by whom it was taken out.

Any one who knowingly prints, publishes, or sells a book or other work, or performs a drama, duly copyrighted, without the written consent of the owner, duly attested, forfeits every copy of the book or the work issued in violation of the copyright, and in his possession; and is also liable to damages.

Damages may be recovered for printing or publishing any manuscript without the consent of the author, if he is a citizen of the United States or resident therein.

The act further provides that an injunction may issue to protect a copyright; and that the provisions of this law do not extend protection to aliens and non-residents.

The words of this act have frequently received judicial interpretation. The applicant, if not a citizen, must be a permanent "resident." The assignee of a foreign resident is not entitled to copyright. "Author" includes any one who performs original labor in composition, whether as writer, translator, or abridger. A "book" may consist in a diagram of one page, with directions for cutting ladies' dresses, as well as the bound volume of many pages. All the contents of a book,

VOL. IV.—E

including engravings, etc., are covered by a copyright. Any mode of depicting action, whether by words, ballet, or pantomime, is included under the term "dramatic composition," and the copyright of such a production will protect the music in the action, the letterpress, the text, and the dramatic incident or situation, but not the mechanical arrangement for facilitating the flow of the incident.

There is no international copyright statute in the United States, though vigorous efforts have been made for some years by native authors as well as foreigners to induce Congress to pass such a measure. (S. C. P.)

PROPHETS. In this article we will consider first the phraseology employed in the Old Testament to describe prophecy and the prophets; secondly, the history of the succession of men known as the prophets; thirdly, their position and functions; and, fourthly, the written works commonly described as the books of the prophets.

I. The word commonly translated "prophet" is *nābhī*, נָבִי. Other words of the same stem are translated "prophesy," "prophecy," "prophetess." The derivation of the word is unknown, and is of no consequence; even the assertion that it is borrowed from the Canaanites is a mere guess. Practically, the word is a technical term used to describe a certain class of men and their acts; the only way to define it is to learn what we can concerning the men.

The phrase, "man of God," has precisely the same meaning as the word "prophet," so far as the person denoted by it is concerned; it is never applied to a priest as such, or to a holy man as such, but always to one who is thought of as having the prophetic character.

The word *roeh*, רֹאֵה, translated "seer," is used a few times to denote the person who is more commonly called a prophet, or a man of God. It is from the stem which primarily denotes ordinary eyesight. Two different nouns of this stem are sometimes translated "vision." The passive verb of it may be translated "appear," and is the verb regularly used to describe the instances when Jehovah is said to have appeared to his servants. The active and the causative verbs of this stem are frequently used of the seeing of visions. In the use of these words a prophet is described as a man to whom Jehovah reveals truth by causing it to take a form in which it is thought of as visible to the eye. Ezekiel's visions of the winged creatures are familiar instances.

A prophet is also sometimes called *hozeh*, הֹצֵה, also translated "seer." Several words of this stem are translated "vision," and the verb may be used in the cognate sense. In some of the other Shemitic languages this stem is employed to denote ordinary eyesight, but in Hebrew it is restricted to the idea of insight or of thoughtful seeing. Used of the visions of a prophet, it may include other forms of divine revelation than those that are thought of as presented to the eye. The word "vision," as found in the titles of the prophetic books, is always a word from this stem (Isa. i. 1, e. g.). Where words of the two stems are found in the same context the derivatives of *roeh* should be regarded as generic, and those of *hozeh* as specific.

The prophetic gift is currently said to be by "the Spirit of Jehovah" (1 Kings xviii. 12; Isa. lxiii. 10, 11; Joel ii. 28, 29 (iii. 1, 2); 2 Chron. xv. 1, etc.).

The phrase "the word of Jehovah," very rarely "the word of God," is used throughout the Old Testament to describe the message brought by a man endowed with the gift of prophecy, e. g., Mic. i. 1; Jonah i. 1; Jer. i. 4. The word *massa*, מַשָּׂא, "burden," is used from Elisha's time onward to denote a prophecy of a certain character (2 Kings ix. 25; Isa. xiii. 1, etc.).

In Hag. i. 13, 2 Chron. xxxvi. 15, 16, and possibly elsewhere, a prophet is called a "messenger," or angel,

of Jehovah. Prophets are also called "watchmen," "servants of Jehovah," "shepherds." In Mic. ii. 6, 11, the word translated "prophet," "prophecy," means physically "to let drop," and so "to talk sagely," to be a sage. But all these are figures of speech, or descriptive phrases, rather than strictly proper terms.

Most of the terms descriptive of prophets and prophecy are actually used in three degrees of extension: first, to denote a man whose distinguishing characteristic is the possession of the prophetic gift, such a man, for example, as Samuel or Isaiah; secondly, to denote any man who has the prophetic gift, even though he is more distinguished in some other direction—Moses, for example, or David, or doubtless Ezra or Nehemiah; thirdly, to denote the men who are also called "the sons of the prophets," that is, the secondary prophets, the disciples or followers of the great prophets (1 Kings xx. 35, 38; 2 Kings ix. 1, 4). For the sake of distinction, we may apply the term "prophetic men" to the second of these three classes.

II. The sources of information concerning the prophets are two—the testimony of the Old Testament, slightly supplemented by testimony from other sources, and the analogy between the religious history of Israel and that of other peoples. In its treatment of the testimony, the article in the *ENCYCLOPÆDIA BRITANNICA* assumes that it is necessary first to recast a large part of the text of the Old Testament, and then to reject certain statements as untrue, and to discount others as fictional. We shall get an account somewhat different if we examine the testimony as it stands, without any preliminary manipulation; and if this account turns out to be consistent and credible it is of course to be preferred to the other.

Before Samuel's Time.—The Pentateuch and some of the later books attribute the gift of prophecy to the patriarchs. Abraham is called a prophet (Gen. xx. 7; 1 Chron. xvi. 22; Ps. cv. 15). The "word of Jehovah" came to him (Gen. xv. 1, 4). Several times it is said of him and of Isaac and Jacob that they had divine visions, or that Jehovah "appeared" to them (Gen. xv. 1; xli. 2; xii. 7; xvii. 1; xviii. 1; xxvi. 2, 24; xxxv. 9).

Prophecy is represented as being very abundant in the times of Moses and Joshua. Moses himself, though we are accustomed to think of him chiefly as a lawgiver, is currently described as "the man of God," and is said to have been the greatest of prophets (Deut. xxxiii. 1; xxxiv. 10; Josh. xiv. 6; Ezra iii. 2; Hos. xii. 13, and very many other places). Miriam is called a prophetess (Ex. xv. 20). Moses is compared with other prophets of his time (Num. xii. 1, 6, 7). We have an account of the prophesying of Eldad and Medad and the seventy in Num. xi. 25-29. The function of a prophet as the special spokesman of his God is assumed to be a well known fact, and is used for the purpose of an illustration (Ex. vii. 1). Specific legislation in regard to prophets is given in Deut. xviii. 15-22; xiii. 1, 3, 5.

But it is alleged that these testimonies come largely from sections of the Pentateuch that are of late date, and that they must therefore be regarded as carrying back into the patriarchal and Mosaic periods the phraseology that properly belongs to later times. In reply to this: First, if all the testimony in the case were of late date, that would not prove the inference as drawn, but would merely open the way for proving it; the statements are still credible unless disproved. Secondly, part of the testimony in the case is from other sources than these alleged late parts of the Pentateuch. Thirdly, irrespective of the phraseology used, the testimony to the facts is clear; it does not depend on the question whether the narrator used the phraseology of his own times or of the times of which he wrote. Fourthly, it is to be noted, however, that in several of the instances cited the writer puts the phraseology describing prophecy into the mouth of Je-

hovah, or of Moses, or some other person, thus apparently representing it to be the phraseology of the time when the events occurred. Finally, the allegation that these sections of the Pentateuch are of late origin is itself not to be accepted without proof, and the proof of it is not forthcoming. (See article *PENTATEUCH*.)

Prophecy is represented to have been in existence in the times of the judges, though the thread of testimony is here slender. It is said that Deborah was a prophetess (Jud. iv. 4); that "a prophet man" came in the Midianite times (vi. 8); that the angel of Jehovah "appeared" to Gideon and to Manoah (vi. 12; xiii. 3, 21); that Manoah and his wife were familiar with the character of a "man of God," and described by that phrase the person who appeared to them (xiii. 6, 8). It is mentioned as marking the time when Samuel was a child that "the word of Jehovah" was then scarce, there being "no open vision" (1 Sam. iii. 1); though even for that time we have an account of a divine message brought by a "man of God" (ii. 27). When Samuel became a distinguished prophet, we are told that Jehovah "again appeared in Shiloh, for Jehovah was revealed unto Samuel in Shiloh in the word of Jehovah" (1 Sam. iii. 21). This seems to imply the restoration of a state of things that had existed in Shiloh before the time of especial scarcity of "the word of God."

The facts thus testified to are entirely consistent with the statement made in 1 Sam. ix. 9. It is there explained, to account for the fact that Saul inquired, not for the prophet, but for the seer, that "seer" was then the term in common use. It does not follow that the term "prophet" had never been known till then; the facts we have been examining rather show that it had been temporarily superseded by the word "seer," this being one of the phenomena of the time of the scarcity of the prophetic gift.

Prophecy in the Times of Samuel, David, and Solomon.—In Acts iii. 24 (cf. 22), in the same breath in which Moses is spoken of as a prophet, we read of "all the prophets from Samuel and them that followed after," as if Samuel was in some sense the first of the prophets. This agrees well with all the statements of the Old Testament. Prophets and prophecy had existed in Israel from the earliest times, but under Samuel they assumed new forms and a fresh importance. Samuel himself, followed by Gad, David, Nathan, Asaph, Heman, Jeduthun, Zadok, Solomon, Ahijah, Shemaiah, Jedo (spelled Iddo in the King James version), form a group of distinguished prophets and prophetic men (see Concordance of Proper Names). Besides these, we find "the companies of prophets," mentioned in 1 Sam. x. and xix., probably organized by Samuel, and certainly controlled by him to a large extent. The attempt to make it appear that Samuel, being a seer, was therefore not properly a prophet, but that the prophets were a different class of men, who afterwards absorbed the class known as "seers," is not a success. The true statement of the difference between such a man as Samuel and the ordinary members of the prophetic companies is, that most of the latter, like the "sons of the prophets" of later times, were mere secondary prophets—the followers and disciples of the men who were recognized as having great prophetic gifts.

Prophecy in the Later Periods.—The next group of prophets is that of which Elijah and Elisha are the great figures. The men of this group who are named in addition to these two are Oded, Azariah, Hanani, Jehu, Micah, Jahaziel, Eliezer, the high-priest Jehoiada, and his son Zechariah. But, in addition to these, prophets are represented to have been very numerous, especially in the Northern kingdom. Obadiah, for instance, saved the lives of a hundred of them, at a time when this was apparently only a small proportion of the whole number (1 Kings xviii. 4; cf. xix. 10). The so-called schools of the sons of the

prophets were flourishing at Jericho, Gilgal, Bethel, and doubtless other places. Very likely most of the numerous prophets were so only in the sense of being members of these organizations. At this time, also, we find mention made of great numbers of false prophets who prophesy in the name of Jehovah (1 Kings xxii.), whether we regard these as mere pretenders or in some other light. The next group is that of which Isaiah is the chief figure, including Jonah, probably Joel and Obadiah, Amos, Hosea, the Zechariah named in 2 Chron. xxvi. 5, Isaiah, the Oded named in 2 Chron. xxviii. 9, Micah, Nahum. Throughout this period true prophets are spoken of as numerous, and false prophets as equally so. (To find instances use Concordance.) The next group includes the Palestinian prophets of the time of Jeremiah. Besides him, we have some account of Habakkuk, Zephaniah, Uriah (Jer. xxvi. 20-23), and Huldah (2 Chron. xxxiv. 22). Prophets, both true and false, are still numerous. Of false prophets, Ahab, Hananiah, and Shemaiah are mentioned by name, with some details (Jer. xxix. 21; xxviii. 10; xxix. 8, 24). Still another group is that of the prophets of the exile in Babylonia. Of these Daniel and Ezekiel are the prominent ones. False prophets are numerous, both male and female, and possibly true prophets also. A final group is that of the post-exilic prophets. To this group belong Haggai, Zechariah, and Malachi, and, by fair implication, Ezra and Nehemiah are to be regarded as prophetic men. The existence of other prophets is referred to, with false prophets among them (Zech. vii. 3; viii. 9; Neh. vi. 7, 14). The Jewish traditions concerning the men of the Great Synagogue affirm that many of these men were prophets. With the death of Malachi the succession of prophets is held by Jewish tradition to have ceased (1 Mac. ix. 27; iv. 46; xiv. 41; Josephus *Cont. Ap.* i. 8).

III. The character and functions of a prophet are briefly outlined in such passages as Ex. vii. 1; Num. xii. 6; 1 Sam. iii. 20, 21; Deut. xviii. He is simply a citizen ("of thy brethren, like unto me") who speaks for Jehovah in a special message given him for the purpose. He differs from the practitioners of magic arts in that he has genuine communications with the invisible world, through the word of Jehovah, revealed to him. He differs from the Levitical priest, in that his message is special, and not a matter of regular routine. The simplicity of the Old Testament statements concerning the prophets is quite remarkable. The prophets did and saw wonderful things, but so far as they themselves are concerned, the elements of mystery and marvel are conspicuously absent, except as these have been interpreted into the Old Testament accounts from other sources.

The Personal Appearance of the Prophets.—Our most current picture of a prophet is one for which some ecclesiastic or monk sat as a model, the artist modifying the picture, according to his fancy, by elements copied from the Greek oracle priests, or from Eastern dervishes. But we may as well start by reminding ourselves that in part the picture is contrary to the facts, and in part the facts are unknown. It is customary to infer from Zech. xiii. 4, Isa. xx. 2, 3, 1 Sam. xxviii. 14, 1 Kings xix. 13, that the prophets as a class wore a peculiar garb to distinguish them from other people; but the passages do not justify the inference, and the contrary is fairly to be inferred from 1 Sam. ix. 18, 2 Kings i. 7, 8, etc. On the strength of 1 Sam. xviii. 10, xix. 19-24, Jer. xxix. 26, and like passages, it is frequently alleged that frenzied utterance was characteristic of the prophets, and indeed that this is the radical idea of the word "prophet" itself. But the assertion that Jeremiah raved is mentioned as a slander, and not as a fact. Saul acted like a crazy man when the spirit of prophecy came upon him at Ramah, but he acted so because he was crazy at the time; the passage does not say nor necessarily imply that any one but Saul acted so. In 1 Sam. xviii.

10, Saul's raving is called "prophesying;" but this may be not because prophesying is thought of as a species of raving, but because Saul, when he raved, talked religiously, like a prophet. Ordinarily, the words and deeds of the prophets, even those that are strangest, or most impassioned, are marked by very clear, self-contained common sense. It is safest to think of a prophet as having the dress, the appearance, and the habits of an ordinary citizen, except in the instances where particular prophets, for particular purposes, are described as dressing or acting otherwise.

The Prophetic Schools.—The term "school," as thus applied, is not Biblical, but is convenient. The evidence does not show to what extent the organizations of Samuel's time (1 Sam. x.-xix.) resembled those of the times of Elijah and Elisha (see especially 1 Kings xx. 35-41; 2 Kings ii.-ix.), but it is a natural conjecture that they were much alike. From 2 Kings v. 22, ix. 1, 4, it is natural to infer that the members of these organizations were mostly young men. That married men were included among them appears from 2 Kings iv. 1. That they were of the obscure class in society has been inferred from 1 Sam. x. 11, but the inference will hardly hold; the surprise that Saul should be among the prophets shows, indeed, that his reputation was different from that of the others, but not necessarily that he was more prominent than they; it may just as well be that he was known as less religious than they. From what is said in the chapters referred to, it appears that the sons of the prophets sometimes lived together in common residences, that contributions for their support were sometimes made by citizens, that they were accustomed to organized action for their own comfort, and for other purposes, that they took their part in national politics, that they cultivated music, that they sometimes held out-of-door religious services (1 Sam. x.), that they had certain exercises in concerted prophesying of some sort (1 Sam. xix.). Whether these were schools or not, they were not mere schools, but organizations for public work and influence. Whether they had anything like a course of study and training we are not informed. As we have seen, their members were sometimes called prophets, but it by no means follows that most or all of them regularly became endowed with prophetic gifts. That some of them became so endowed is probable; and it is also probable that the name "prophet" would come to be applied to them, in general, whether they had the gift or not.

The So-called Prophetic Order.—It is probable that the prophets were an unbroken succession, in the sense that from Malachi back to Samuel, and earlier, Israel was never wholly without living prophets of Jehovah. But in addition to this a great deal is said about the prophetic order, as if the prophetic body had an organic character, like that of the priests, or was perpetuated by some ordaining act, like the ministry in the Christian churches. It is true that some priests were prophets or prophetic men, Zadok, Jeremiah, and Ezra, for example; it is also true that a prophet, not of the priesthood, might be commissioned to perform priestly acts, Moses for example, Lev. viii. 15-30; but there is no trace of any priestly functions regularly exercised by the prophets, as prophets, nor of any properly prophetic functions regularly exercised by the priests as such. In this the religion of Israel differed notably from certain other ancient religions. The only alleged instance of anything like ordination is the setting apart of Elisha, 1 Kings xix. 15, 16, 19; cf. 2 Kings ix. 1-13. But Elisha's case is evidently exceptional, like the parallel cases of Jehu and Hazael. He was not set apart to be a prophet, but to do certain especial work as a prophet.

In fine, a prophet became such, so far as appears, solely by becoming endowed with prophetic gifts; he came to be recognized as a prophet by its being perceived that he had the gifts (Deut. xviii. 21, 22; xiii. 1-5), and not ordinarily through his costume or per-

sonal appearance, or mode of life, or registry of ordination. But men might, of course, become secondary prophets by merely becoming followers of the prophets whose gifts were recognized.

Certain Naturalistic Functions of the Prophets.—They were prominent as the public men of their times. In proof, note what is said concerning the career of Moses or Samuel, Elijah, Elisha, Isaiah, Jeremiah. They were the leaders of the party that advocated a certain religious policy on the part of the government, and of the party that opposed foreign alliances in every direction. After the Babylonian conquest became an accomplished fact, such prophets as Jeremiah advocated the political action that accepted it as a fact. As long as the separate kingdoms of Israel and Judah existed, the prophets were a bond of unity between the two kingdoms; Judean prophets like Amos and Isaiah prophesied for the Northern kingdom, and northern prophets, Elisha and Hosea, for instance, for the Southern kingdom (Am. i. 1; iii. 1, 12, etc.; Hos. xi. 12, etc.; 2 Kings iii. 14; Jer. xxx. 3, 4; xxxi. 1, 5, 6, 9, 12, 15, 18, 20, 27). In short, a biography of the prophets would be a history of Israel.

They were the reformers of their times. Besides religious questions, they discussed improper divorce, licentiousness, usury, land monopoly, drunkenness and dissipation, slavery, and like questions (Mal. ii. 10-16; Jer. v. 7-9, etc.; Neh. chap. v.; Ezek. xviii. 8, etc.; Isa. v. 7-10, 11-22; Jer. xxxiv. 8-22, and the prophetic books throughout). Further, they were evangelistic preachers and organizers. As a rule, the prophetic books are homiletic. Still further, they were the literary men of the nation. This is of course true of the so-called literary prophets and their contemporaries, and among those who lived earlier the Bible attributes authorship to Elijah, Jehu, Shemaiah, Jedo, Ahijah, Solomon, David, Ethan, Heman, Asaph, Nathan, Gad, Samuel, Joshua, Moses. So far as functions of these kinds are concerned, the prophets of Israel have their counterparts among two classes of men, in all ages: first, among devout religious workers, adherents of the true religion; and, secondly, among the especially gifted men whom God anywhere raises up for special purposes in the history of mankind.

Wonder-Working by the Prophets.—But in addition to all such functions as have been mentioned, the Old Testament attributes distinctly supernatural powers to the prophets. Under the influence of the Spirit of Jehovah, supplied to them for that purpose, they became workers of miracles. Familiar instances of this sort are to be found in the accounts given of Elijah and Elisha. Very prominent among their miracles is the supernatural discovering and revealing of secrets, e. g., 2 Kings vi. 12, or Dan. chap. ii.

The Prophets as Predictors of Events.—In Christian apologetics, the argument from fulfilled prediction has constituted one of the chief uses made of the prophecies. Owing in part to this fact, many persons unquestionably make the predictive element too prominent in their ideas of prophecy. Prediction is far from being, as many imagine, the central and essential factor in prophecy. Nevertheless, the Old Testament represents it as a real factor, and an especially important one. Evidently a prediction might be one of the signs whose fulfillment would accredit the prophet who speaks in Jehovah's name, Deut. xviii. 22; xlii. 1-5. Fulfilled predictions are prominently claimed as having this effect, e. g., Isa. xli. 22, 23, 26; xlii. 9; xliii. 9, 12, 18, 19; Zech. i. 4-6.

Messianic Preaching by the Prophets.—That which the prophets make most prominent in their utterances is the doctrine that Israel is Jehovah's peculiar people, in virtue of Jehovah's purpose, and his covenant with Abraham, Isaac, and Jacob; that this covenant promise and purpose has been receiving fulfillment up to the time when each prophet lived, and is to have yet larger fulfillment in the future. In all the pro-

phetic writings this doctrine, either expressed or implied, lies at the basis of all counsel, all rebuke, all exhortation to repentance or obedience, all encouragement, all comfort, all direction for private life, all patriotic appeal, all religious teaching. The doctrine is central in the discourses of the prophets, just as the doctrine of a crucified and risen Christ is central in the discourses of the apostles. A part of this doctrine is that Israel's mission as Jehovah's peculiar people is not for himself alone, but for all the nations. The passages cited in the New Testament in support of the claims of Jesus are, with hardly an exception, those in which the prophets teach this great central doctrine. The New Testament claim is essentially that the promised fulfillment of Jehovah's covenant purpose with Israel mainly comes about through Israel's Christ, and that Jesus of Nazareth is that Christ.

If this view be correct, we have in the Old Testament not a great number of predictions concerning the Messiah, but a single prediction, often repeated in a great variety of forms and aspects. If we make a distinction between prediction and promise or doctrine, the Messianic utterances of the Old Testament are of the nature of promise and doctrine rather than of prediction, though this does not render them any the less genuinely predictive. With this view of the matter, we need neither affirm that the evangelists claim that the prophets had in mind the person of Jesus, when they wrote these passages, nor admit that the evangelists used the passages in an accommodated sense. From the point of view of the great covenant promise, they regard the history of the Christ as the crowning portion of the history of Israel, and they interpret accordingly what the prophets say of the future history of Israel, as fulfilling the covenant promise.

The Prophets and Jehovah's Law.—The handling of the Torah of Jehovah is, in the Old Testament, attributed to both the priests and the prophets. It does not follow that there were two different bodies of Jehovah's law—a prophetic Torah and a priestly Torah. The difference seems rather to be that the priests, in association with the magistrates, were the custodians, teachers, and interpreters of such law as Jehovah had already given (Deut. xxxi. 9; xvii. 8-12, 18, 19; 2 Chron. xv. 3; xvii. 9; Jer. ii. 8; Lev. x. 11; Deut. xxxiii. 10; xxiv. 8; Mic. iii. 11; 2 Kings xvii. 27, 28, etc.), while the prophets not merely give instruction in the law, but bring the law from Jehovah (Isa. viii. 16, 20; Neh. ix. 26; Jer. xxvi. 4, 5; Dan. ix. 10; 1 Sam. xii. 23, etc.). The representation everywhere seems to be that through the prophets Jehovah revealed the Torah, which it was the duty of the priests merely to administer.

The term "Torah," as thus used, seems to have been applicable to any particular revelation made by Jehovah to a prophet, especially if the revelation were committed to writing, and again, to have been applicable collectively to the whole body of such revelation. It is more correct to say that it is often so used as to include the sacred writings attributed to Moses, than to say that it is currently used to denote those writings. Long before the Christian era, however, those writings had come to be regarded as the Torah *par excellence*.

Modes of Divine Revelation to the Prophets.—As we have already seen, the inspiration of the prophets is represented to have been by the Spirit of Jehovah. The modes in which the Spirit is said to have communicated with them are commonly classified as three, namely, by dreams, by visions, and by direct revelation. A better classification is that suggested by the terms employed to describe the prophets, namely, first, by dreams (Num. xii. 6; Deut. xlii. 1; Dan. i. 17), with the dreams of Joseph, Solomon, etc., and the interpretations by Joseph, Daniel, etc.; second, by sense-visions, the presenting of object lessons, thought of as visible to the eye, as in Zech. i. 8-13, 18-21; ii. 1-5; iii., etc.; third, by theophanies, Jeho-

vah (usually in the character of "the angel of Jehovah") taking visible form and appearing to the eye, or attracting the eye by some visible manifestation (the burning bush, for example), and then communicating directly with the person thus aroused; fourth, by excited insight, or other form of mental vision, as distinguished from sense-vision. Among the most familiar instances of theophany are those described in Gen. xviii., Ex. iii., the events at Sinai, Jud. xiii. Perhaps the instance in 2 Kings iii. 15 is an instance of mental vision as distinguished from sense-vision. It may be presumed that most of the instances described by words of the stem *ḥāḥ* are instances of mental vision, except as otherwise specified. Theophany, in either form, is regarded as the highest form of divine communication.

Modes of Utterance by the Prophets.—Certain peculiar modes of utterance by the prophets bear a close analogy to the modes of revelation just considered. For example, they use symbols, that is, physical objects or personal acts representing the truths they have to utter, e. g., 1 Kings xi. 30, 31; Ezek. xxxvii. 15, seq.; Isa. chap. xx. A higher class of symbols are those called types. The subject of prophetic typology has been voluminously discussed, with much difference in definition and opinion. Perhaps the best definition of what is properly to be called a "type" is that it is an object or event used to present a great truth in such a way that it becomes a foreshadowing example of a greater presentation of the same truth. Thus Christian theology might hold that the Levitical sacrifices were types of the sacrifice of Christ, or that each member of the line of great Old Testament prophets was a type of Christ in his prophetic office.

No utterances of Jehovah's prophets have a double meaning in the sense of being equivocal in meaning. In some cases which have been regarded as presenting a double sense, the New Testament uses a prophetic passage simply for illustration. An instance of this kind, doubtless, is that in which Matthew applies Jeremiah's language concerning Rachel weeping for her children to the case of the innocents slaughtered by Herod, Matt. ii. 18; Jer. xxxi. 15. But there is a large class of instances in which a prophecy may have a manifold application, or a manifold fulfilment, without being equivocal in meaning. Types and antitypes, for example, may occur in a series, so that the foretelling of one event amounts to the foretelling of all the future events in the series. Or a statement made concerning some part of a complex event may equally be true of the whole, or *vice versa*. Or a prediction may be capable of a successive or a progressive fulfilment. Or the foretelling of a final event in a historic process may imply that of many of the events that lead up to the final event. It is evident that in these and other ways a prophecy may be generic without being ambiguous. And still further, when a prophecy, whether properly predictive or not, enunciates a principle on which God acts, its statement may be made to apply to every case in history that comes under the principle.

IV. The Jewish tradition counts the Books of Joshua, Judges, Samuel, and Kings as the four books of the earlier prophets, and the Books of Isaiah, Jeremiah, Ezekiel, and the twelve Minor Prophets as the four books of the later prophets. By one form of the tradition—a form which is corroborated by the arrangement of the versions and by the phenomena in the case—Ruth is counted as a part of the collection of the earlier prophets, being regarded as one with Judges, but our present Hebrew Bibles put Ruth in the Hagiographa. They also put Lamentations in the Hagiographa, though another form of the tradition counts this book along with Jeremiah as prophetic. Starting from the idea that prophecy is mainly prediction, it is sometimes mentioned as remarkable that Daniel, the book more marked by prediction than any other, is uniformly reckoned among the Hagiographa,

and not in the division called the Prophets; but really, the fact that the book is predictive, to the exclusion of the homiletical element, constitutes a sharp difference between it and most of the books that are classed as prophetic. Whatever may have been the reason for classifying this list of books as "The Prophets," it certainly does not indicate that the men who made the classification regarded the Pentateuch and the Hagiographa as of non-prophetic authorship. It is beyond dispute that they, whoever they were, regarded Moses, David, Daniel, and others as prophets, and regarded all the Old Testament as written before the disappearance of prophecy. See articles on BIBLE and CANON.

The records contained in the Books of Judges, Samuel, and Kings, up to the times of Jeroboam II. of Israel, doubtless consist largely of transcriptions from writings of Samuel, Gad, Nathan, Ahijah, Shemaiah, Jehu, and other prophets, who flourished before the times of Amos and the other earliest prophets whose names are attached to our present prophetic books. This fact, or even the traditional opinion that this was the fact, affords a natural and plausible reason why these books should be called the books of the earlier prophets. See further in the articles JUDGES, RUTH, SAMUEL, KINGS.

The books commonly called the twelve Minor Prophets seem to be arranged in what their collector regarded as four chronological groups. The last three, *Malachi*, *Zechariah*, and *Haggai*, belong to the Persian period. The two next preceding, *Zephaniah* and *Habakkuk*, belong with *Ezekiel* and *Jeremiah*, in the Babylonian period. The next two preceding, *Nahum* and *Micah*, belong with most of Isaiah in the later Assyrian period—the period of the Sargonidæ. The intention seems to have been to indicate that the first five of the twelve books belong in a group together, dated by the dates of *Hosea* and *Amos* as in the middle Assyrian period—the period to which Tiglath-pileser gives character. *Hosea* is placed first, though it is not the earliest. The Jewish traditions explain this by the fact that it is the largest of the twelve books. The earlier prophecies of Isaiah belong with these five books to the middle Assyrian period, and the historical situation of Zech. ix.-xiv. is that of the same period, no matter when these chapters were written. Our study of the books will be facilitated if we first make a brief survey of the history of the period.

On their face the Biblical numerals give 175 years for the interval between the accession of Jehu and the destruction of Samaria. The chronology most commonly received so treats the numerals as to reduce this by a few years, and the chronology now accepted by many Assyriologists and others rejects a part of the statements of the Bible, and reduces the length of the period by about fifty years. It is not a matter of indifference which chronological theory we accept, but we need not now discuss the question, as the point before us does not depend upon it. In any case the first decades of the interval belong to what may fairly be called the earlier Assyrian period, that in which Shalmaneser II. figures prominently. This monarch mentions Samaria and nearly all the Palestinian countries except Judah as his tributaries, and says that Hazael of Damascus, who came to the throne at about the same time with Jehu, was conquered after some resistance. According to the accounts in the Books of Kings and Chronicles, Hazael's reign lasted some forty-six years, his son Benhadad being a part of the time associated with him in some capacity; it covered the reigns of Jehu and his son Jehoahaz in Israel, and those of Athaliah and Joash in Judah. Hazael was the enemy of Israel. We may assume that he was checked by the power of Assyria, but before the death of Jehu he had "cut Israel short" and gained control of the country east of the Jordan. Later, he and his son Benhadad utterly wasted the Northern kingdom, and finally, in the last year of Joash of

Judah, he invaded Philistia, and afterward marched against Jerusalem. Meanwhile, according to the Moabite stone, corroborated by such notices as that in 2 Kings xiii. 20, the Moabites were also engaged in acts of successful hostility against the two Israelite kingdoms, and we may assume that their usual allies, the Ammonites, were associated with them.

The great event of this part of the history is Hazael's expedition against Jerusalem. The accounts of it are brief, but with several very distinct particulars. It occurred just at the close of the reign of Joash of Judah, 2 Chron. xxiv. 23, 25. The utter wasting of the Northern kingdom had continued up to that time, that is, all the days of Jehoahaz, 2 Kings xiii. 3, 14, 22. Hazael first took Gath, and started for Jerusalem from that direction, 2 Kings xii. 18 (17). With a comparatively small force he signally defeated a very great army of defence, 2 Chron. xxiv. 24. He destroyed the princes of Judah, and captured their spoil, 2 Chron. xxiv. 23. Joash bribed him to leave by giving him sacred treasure from the king's house and the temple, 2 Kings xii. 19 (18). It is not said that he captured Jerusalem. He left Joash of Judah prostrated by illness and about to be slain by conspirators, 2 Chron. xxiv. 25. Very soon after, Hazael died, and Joash, the newly crowned king of the Northern kingdom, was able, notwithstanding the depleted condition of his power (2 Kings xiii. 7), to overcome Benhadad in a succession of battles and recover the cities of Israel.

Rimman-nirari, the contemporary king of Assyria, grandson of Shalmaneser, says that Tyre, Sidon, the land Omri, Edom, Philistia, were tributary to him, and immediately adds an account of his besieging Mariha, king of Damascus, and compelling him to submission and to the payment of immense fines. These operations are not dated, but it is plausible to conjecture that Mariha (the lord) is an appellation for Hazael, and that the interference of the Assyrian king may account for the successes of Joash of Israel. But whether this conjecture be accepted or not, the Biblical account is that the successes of Hazael at Jerusalem were presently followed by his death and the humbling of his kingdom.

It remains further to be noted in connection with these events that Amaziah, the successor of Joash of Judah, a few years later regarded himself as having reason to take bloody vengeance on the Edomites; possibly this may suggest something as to the attitude of Edom in the days of Hazael.

Joash of Israel reigned sixteen years, and was succeeded by Jeroboam II., who reigned forty-one years. In Jeroboam's twenty-seventh year Uzziah became king of Judah. Waiving the question whether we should count the numerals as overlapping one another, and should thus, or by any other process, count the period as shorter than it at first seems to be, our attention should now be fixed on the fifteen years (or whatever the number may be) during which Jeroboam and Uzziah are said to have been contemporary. The situation now contrasts very strongly with that when Hazael made his attempt upon Jerusalem. Jeroboam "restored the border of Israel from the entering of Hamath unto the sea of the Arabah," 2 Kings xiv. 25. He "restored Damascus and Hamath to Judah in Israel," xiv. 28. Of Uzziah it is recorded that he built Elath, 2 Kings xiv. 22; that he made successful war with the Philistines and other enemies, and received tribute from the Ammonites, 2 Chron. xxvi. 6-8; that "his name spread abroad even to the entering in of Egypt," xxvi. 8; that he fortified Jerusalem, and had an immense army, xxvi. 9-15; that "his name spread far abroad," xxvi. 15. It is common to assume that Judah and Israel were at this time in hostility; but the passages cited more naturally imply the contrary, and give us to understand that they were two kingdoms with one policy and purpose, and with a sway under which Hamath, Syria-Damascus, the Ammonite coun-

try, and Philistia were included as tributaries. This, with the possession of the Elanitic gulf, implies the subjection of Moab and Edom, as well as of the peoples mentioned.

We instinctively ask how it was possible that Assyria would allow such a power to spring up in the west, and reduce her tributaries to tribute? At present, there is no answer to this question, but certain Assyrian inscriptions of a few years later testify to the fact that these Assyrian tributaries actually had "in their faithlessness made revolt to Azariah," giving him such strength as to make him a formidable foe to Assyria. See Schrader's *Cuneiform Inscriptions*, translated by Whitehouse (pp. 208-212), or the inscriptions attributed to Tiglath-pileser, in any collection of Assyriological matter. The inscriptions in question are so mutilated that very little can be learned from them, but they clearly agree with the Biblical statements as to the greatness of Uzziah and the extent of the sway of the combined Jewish-Israelite kingdoms of this period. They further indicate a temporary decadence of the Assyrian empire, covering a longer or briefer time, between the date when Assyria held all this region in undisputed subjection, and the date when Assyria was making efforts to wrest the same region from its allegiance to Uzziah.

Leaving the remainder of the history, for the present, we are now ready to look at the prophetic books which connect themselves with the history as already sketched.

The Book of Amos.—This book dates itself "in the days of" Uzziah and Jeroboam, "two years before the earthquake." The best analysis of it makes it to consist of four discourses, the song "I will not reverse it," i. 3-ii. 16, the exhortation, iii.-iv., the lamentation, v.-vi., and the book of visions, vii.-ix. The present treatment will be confined to a single point, namely, the historical situation presented in the book.

This is twofold: the book is quite distinct in its picture of the times when it was written, and in addition to this, it is very distinct in its presentation of a certain earlier period, to which it alludes in the way of reminiscence. We find here the same representation that we found in the historical books as to the extent of the dominion of Israel in the reigns of Jeroboam and Uzziah. "From Hamath to the brook of the Arabah," Am. vi. 14, shows this, as does the challenge to compare the region of Assyrian conquests centring in Calneh with the region from Hamath to Gath, vi. 2. If "Damascus" is the correct reading in iii. 12, that verse represents Israelite grandees as living in luxury in the subject city Damascus. It follows that some at least of the peoples mentioned in i. and ii. are there thought of as dependent on Israel and Judah, and not as independent.

We find the same community of interest between Israel and Judah that we found in the accounts in the historical books. Amos is a Judaite, i. 1. His predilections are for the house of David, ix. 11, *et al.* But his prophecy refers almost exclusively to the Northern kingdom. He seems to know no difference between Jeroboam's Hamath and Uzziah's Gath, but speaks as if both were included in the same interest. The passage between him and Jeroboam's priest Amaziah (vii. 10, 12) could hardly have taken the form it did, except when the relations between Israel and Judah were intimate. See also iii. 1 and ix. 12.

We find that the prosperity mentioned in the historical books has resulted in luxury, dissipation, and the oppression of the poor by the rich, on the part of both men and women, ii. 6, 7; iii. 9, 12; iv. 1; v. 11, 23; vi. 1, 4-6. We further find, throughout the book, descriptions of the religious life of the Northern kingdom, its various sanctuaries, its conformities to the law of Moses and the opposite, that give to the book especial historical interest and value.

To mention only one thing more in this list, the

book is written under the shadow of a threatened and impending invasion from Assyria. To cite a few among many passages, calamity and exile are thus threatened in v. 2, 5, 27; vi. 7, 10; vii. 16, 17; ix. 9. Syria, Ammon, etc., are included in the threat, i. 5, 15, etc. In i. 5, vi. 2, 14, Assyria is pretty distinctly pointed out as the power that will carry these peoples into exile, though it is not directly named.

So much for the historical situation contemporary with the uttering of these prophecies. A very different situation, belonging to an earlier date, is recalled by the prophet in chapters i., ii., and iv. 6-11. Whatever else may be referred to in the first two chapters, the following points are clear: Damascus is named first in the list of threatened nations, the names of Hazael and Benhadad being also mentioned, i. 3-5. The sin especially charged is the "threshing" of Gilead (cf. 2 Kings x. 32-33; xiii. 7). Ammon and Moab are included among the threatened nations (i. 13-15; ii. 1-3), the sin of Ammon being that "they ripped up the pregnant women of Gilead, that they might enlarge their border" (cf. 2 Kings viii. 12; xiii. 21, and the Moabite stone). Gaza, Ashdod, Ashkelon, and Ekron are mentioned (but not Gath), i. 6-8, the offence charged being this very peculiar one, that "they caused to go into exile an entire exile-band, shutting [them] up to Edom." Tyre is included, charged with two offences, namely, "their shutting up an entire exile-band to Edom," and that "they remembered not a brethren's covenant," i. 9, 10. Edom directly follows Philistia and Phœnicia in this list, with the charge that he "pursued his brother with the sword," and was implacable in his cruelty, i. 11, 12. In connection with these phrases of brotherhood, as used of Tyre and Edom, note that the charge against Moab is his burning the bones of the king of Edom to lime, ii. 1.

The situation thus outlined is peculiar enough to fix our attention. Apparently, the two Israelite kingdoms have their interests in common; Israel has been in brotherly relations of some sort with Phœnicia and with Edom; Israel and Edom have suffered grievously from the hostile attacks of Moab, Ammon, and Syria—the Syria of Hazael and Benhadad; a change has come, in which Phœnicia and Edom prove false to the brotherly relations, Edom committing bitter hostilities, and Phœnicia and Philistia somehow less directly supporting the hostile acts—"shutting up an entire exile-band to Edom," whatever that may mean. Evidently, these are not the particulars given in the historical books, of Hazael's career, and his great attempt upon Jerusalem; but just as evidently, it is likely that these may be additional particulars of those transactions. As long as Edom, Phœnicia, and northern Israel quietly paid their tribute to the Assyrian, they had so much, at least, in common, distinguishing them from Hazael and his confederates, who were in the habit of making revolts. When Hazael at last made his march from Gath upon Jerusalem, defeating the great army that opposed him, he necessarily sent a crowd of fugitives flying for safety to the neighboring countries. It would be very much like the Edomites, at such a crisis, to break loose from their friendliness, and treat with hostility both the fugitives who came among them, and other men of Israelitish blood. It would not be unlike the Phœnicians and Philistines to aid them in this, or to seek to make gain from them and the Syrians, by affording them a market for their captives and their spoils. Thus understood, the particulars fit so well as to render it probable that this is the true explanation of them.

Our versions render the verbs in Amos iv. 6-11 in the present-perfect tense, as if the situation there described was contemporary with the prophet, thus making the passage difficult to reconcile with all else that is said in the book as to the contemporaneous situation. The verbs should rather be translated by our simple past, *e. g.*:

"And also I, for my part, give you cleanness of teeth in all your cities,
And lack of bread in all your places;
Yet ye returned not unto me, saith Jehovah."

This and the following verses thus allude to notable calamities that God had brought upon the people at some past time not here specified. They mention a calamity of drouth, verses 7, 8, a calamity of blasting and of locusts, verse 9, and then follows:

"I sent among you pestilence in the way of Egypt;
I killed your chosen youths with the sword,
With the captivity of your horses,
And I brought up the stench of your encampments even into your nostrils;
Yet ye returned not unto me, saith Jehovah."

"I made overthrow among you,
Like God's overthrowing Sodom and Gomorrah,
And ye were as a brand plucked from a burning,
Yet ye returned not unto me, saith Jehovah."

It is barely possible that the "way of Egypt" may here mean "after the manner of Egypt," but that is an unnatural translation. By its most simple and natural meaning the phrase is geographical, and we have here a mention of a signal overthrow of the forces of Israel in the region lying toward Egypt. Either the destruction in battle was preceded by a pestilence in the camp, or it is itself called a pestilence. At once we recall to mind that, according to the historical books, Hazael was on his way from Gath to Jerusalem, and, therefore, somewhere "in the way of Egypt" when Jehovah "delivered a very great host into their hand," and also that there is no other recorded defeat of Israel that corresponds to this description in Amos. It is not a necessary part of the view now presented, but is in itself likely that "the very great host" in question was composed of the allied armies of Israel and Judah, and that it was after this defeat that Jehoahaz had left only fifty horsemen, ten chariots, and 10,000 footmen (2 Kings xiii. 7). There may be a connection between the disproportionately small number of horses left to Jehoahaz and the fact described in Amos in the noticeable phrase, "with the captivity of your horses."

It seems to be true, therefore, as we should have expected to find it, that the career of Hazael was still remembered with especial distinctness in the times when Amos prophesied, and that several additional particulars in regard to it are preserved to us in the allusions made by this prophet.

The Book of Obadiah.—This book speaks of an event in the past in which Edom wronged Judah, of punishment already incurred for the wrong, and of yet greater punishment in the future. The points mentioned in regard to the wrong to Judah are that strangers took his army captive; that they came into the vicinity of his gates (possibly, that they entered); that they cast lots upon Jerusalem, verse 11; that they "drank" upon the holy mountain, verse 16; that there was "the exile-band of this army to the sons of Israel" among the "Canaanites as far as Zarephath," and "the exile-band of Jerusalem which is in Sepharad," verse 20. Nothing is said about Jerusalem being destroyed or even captured, nor about the land being made desolate, nor about the nation in general going into exile. In these respects there is a sharp difference between Obadiah and the passages in Ps. cxxxvii.; Ezek. xxv. and xxxv.; Lam. iv., and, indirectly, Jer. xlix. In other words, the event here described has not very much in common with the destruction of Jerusalem by Nebuchadnezzar. The particulars agree at least equally well with those of Hazael's expedition. Further, the resemblances between this event and that referred to in Amos are striking. We have the same stress laid upon the fact that Edom was in brotherly relations with Judah, and was false to these, verses 10, 12. In verse 14 we have

the same peculiar phraseology that we found in Amos: "and shut thou not up his survivors in a day of distress." But the phrase, obscure in Amos, is here intelligible, being interpreted by the parallel line, "And stand thou not at the fork of the road to cut off his escaping ones." In Amos Edom is associated with Philistia and Phœnicia, and the same is true, though less distinctly, in Obadiah, see verse 19, and "Canaanites as far as Zarephath," verse 20. From Obad. 7 it appears that Edom's allies used him for their own advantage, got him out to the border, deceived him, made his bread a snare to him—that is, possibly stimulated him to acts of violence by furnishing him a market for spoils and captives; cf. verse 20. The implication is that they did not stand by him after they had thus got him into trouble. With this agrees the fact that, a few years later, when Amaziah took vengeance on the Edomites in Sela (2 Kings xiv. 7; 2 Chron. xxv. 11, 12; cf. Obad. 3), they seem to have stood alone.

It follows that we have no need to pull the text of Obadiah to pieces, and no need to put forced explanations on the fact that Obadiah speaks as if Ephraim, Samaria, the house of Joseph (verses 18, 19), existed in his time side by side with Judah, in order to reckon the phenomena of the book with its supposed reference to the taking of Jerusalem by Nebuchadnezzar. The reference is not to the Babylonian monarch, but to Hazael. The Book of Obadiah gives us the following particulars connected with Hazael's invasion, in addition to those stated or alluded to in the historical books and Amos: There was a scene of drunken revelry and gambling in the vicinity of Jerusalem, verses 16a, 11c; bands of captives were sold into exile by way of the Phœnician coasts, or sent to Sepharad (Sardis, perhaps), verses 14, 20; Edom claimed, by way of justification, some right of retaliation for some previous injury, verse 15.

These considerations seem to fix the date of the prophecy as after Amaziah's revenge upon Edom, and at a time when there was cordial feeling between Judah and Israel; that is, either just before Joash of Israel beat Amaziah and broke down the walls of Jerusalem (2 Kings xiv. 8-14), or some years later than that event, probably the former.

The Book of Joel.—This book, like Obadiah and unlike Amos, is distinctly Judaite, being even more so than Obadiah. It consists of a single discourse, and therefore belongs to a single date. Probably no one would dispute that its affiliations with Obadiah are such as to prove the two books to be of about the same date.

The careful reader will observe that the argument mainly depended upon, in the article in the *ENCYCLOPÆDIA BRITANNICA*, to prove that Joel is post-exilic is drawn from the fact that Joel evidently presupposes the priestly legislation of the Pentateuch, and must, therefore, have been written later than that legislation. To one who is already convinced that the priestly legislation is post-exilic the argument is decisive; but really it is bad reasoning first to argue that the priestly legislation is post-exilic because it is only mentioned in post-exilic books, like Joel, and then to infer that these books are post-exilic from the fact of their mentioning the priestly legislation.

The historical situation recognizable in Joel is mainly that of a related group of recent calamitous events. Verbally, the calamities mentioned are three—a drouth, i. 10-13, 15-20; a locust plague, i. 4-9; ii. 1-11, and a subjugation to enemies. In this Joel is parallel with Amos iv. 7, 8, 9, 10, 11. Whether we regard the drouth and the locust plague as separate facts or as figurative modes of expression for the invasion by enemies, in any event the invasion is the most prominent fact contemplated in the descriptions, the threats, and the promises of the book. The situation is peculiar, is pretty distinctly outlined, agrees in some particulars with the situation of the invasion of Hazael, as

presented in the historical books, and in Amos and Joel, and is in no particular inconsistent with that situation.

It was a time when strangers were passing through Jerusalem, iv. 17 (iii. 17); when Jehovah's inheritance was being dominated to its reproach by the nations, ii. 17-19; when they had apportioned Jehovah's inheritance, scattered Israel among the nations, and reduced the population of Jerusalem to an escaping remnant, iv. 2 (iii. 2); iii. 5 (ii. 32); cf. Obad. 17. Joel nowhere uses any word of the stem *נָסַח*, and, properly understood, nowhere speaks of the nation as being in exile; but he speaks of a condition of captivity, either past, present or future, from which Judah needed restoration, iv. 1 (iii. 1). Like Obadiah, he speaks of a scene of revelry, when Jewish captives, boys and girls, had been sold cheap to satisfy the demands of drink and lust, or had been gambled for, iv. 3 (iii. 3); cf. Obad. 11. In these injuries Edom and perhaps Egypt had participated, doing violence to the sons of Judah, and shedding innocent blood in their land (perhaps the blood of Jewish fugitives shed in Edom), iv. 19 (iii. 19); cf. Obad. 10. Tyre, Sidon, and Philistia, under pretence of retaliating upon Jehovah for something (say for the fate of Jezebel and Athaliah), had taken their part in the affair, iv. 4 (iii. 4). Perhaps in the way of trade for spoils they had brought in Jehovah's silver and gold and delightful things into their palaces, iv. 5 (iii. 5); they had sold Jewish captives as slaves to the Greeks long distances away, iv. 6 (iii. 6); cf. Obad. 20.

Joel describes the principal agent of subjugation as "the northerner," ii. 20. His occupation of the country is not permanent, but he is driven out into a dry and desolate country, and his stench ascends. His going is with his face to the eastern sea, and his rear toward the hinder sea; that is, perhaps, from the vicinity of Jerusalem, out of the country in an easterly direction. At first thought this might seem inconsistent with the referring of the passage to Hazael, since the account in Kings seems to represent him as leaving the country in triumph, bearing with him the spoils of the temple, which had been given him to bribe him to leave. But why did Hazael content himself with thus receiving a part? Now that Jerusalem was at his mercy, why did he not take the whole? Combine the suggestion in these questions with the possibility that the interference of Rimman-nirari occurred at this point of time, and with the fact that the power of Syria so soon afterward went down before that of Israel, and we see that this part of Joel's description may very probably be true of the invasion by Hazael.

If the reference is to this event, it fixes the date of the Book of Joel. It belongs within the lifetime of the men who had witnessed the event, i. 2, while some of the captives then taken were yet living, with the promise of returning to their native country, iv. 7 (iii. 7), cf. Obad. 20.

Joel elaborates a doctrine of the day of Jehovah, in which Jehovah will judge the nations; Obadiah and Amos cite this doctrine as something already known, e. g., Obad. 15; Amos v. 18. From this and other circumstances, it is to be inferred that Joel was first published, then Obadiah, then Amos, and that the citations of one from the other are to be interpreted accordingly. Joel and Obadiah were prophets, by whose word concerning Jehovah's day of judgment for the nations Jeroboam and Uzziah were encouraged in the efforts by which they established their power from Hamath to the sea of the Arabah, and thus became the "saviours" Jehovah promised, Obad. 21; 2 Kings xiii. 5; while Amos prophesied a few years later, against the sins that were rife, in spite of Jehovah's graciousness.
